The proposed Project site is located in Imperial County, California. The County is comprised of approximately 4,597 square miles or 2,942,080 acres.<sup>3</sup> Imperial County is bordered by San Diego County to the west, Riverside County to the north, the Colorado River/Arizona boundary to the east, and 84 miles of International Boundary with the Republic of Mexico to the south. Approximately fifty percent of Imperial County is undeveloped land under federal ownership and jurisdiction. The Salton Sea accounts for approximately 11 percent of Imperial County's surface area. In 2019, fifteen percent (15%) of the area was in irrigated agriculture (463,948 acres), including 14,676 acres of the Yuma Project, some 35 sections or 5,600 acres served by Palo Verde Irrigation District (PVID), and 443,672 acres served by IID.<sup>3F4, 4F5</sup>

The area served by IID is located in the Imperial Valley, which is generally contiguous with IID's Imperial Hydrologic Unit, lies south of the Salton Sea, north of the U.S./Mexico International Border, and generally in the 658,942-acre area between IID's Westside Main and East Highline Canals.<sup>8</sup> In 2019, IID delivered untreated water to 443,677 net irrigated acres, predominantly in the Imperial Valley, along with small areas of East and West Mesa land.

The developed area consists of seven incorporated cities (Brawley, Calexico, Calipatria, El Centro, Holtville, Imperial and Westmorland), three unincorporated communities (Heber, Niland, Seeley), and three institutions (Naval Air Facility [NAF] El Centro, Calipatria CDCR, and Centinela CDCR) and supporting facilities. Figure 4 provides a map of the IID Imperial Unit boundary, as well as cities, communities, and main canals.

### 7.1 CLIMATE FACTORS

Imperial Valley, located in the Northern Sonoran Desert, has a subtropical desert climate characterized by hot, dry summers and mild winters. Clear and sunny conditions typically prevail, and frost is rare. The region receives 85 to 90 percent of possible sunshine each year, the highest in the United States. Winter temperatures are mild, rarely dropping below 32°F, but summer temperatures are very hot, with more

<sup>8</sup> [IID Annual Inventory of Areas Receiving Water Years 2019, 2018, 2017](#)

than 100 days over 100°F each year. The remainder of the year has a relatively mild climate with temperatures averaging in the mid-70s.

The 100-year average climate characteristics are provided in **Table 4**. Rainfall contributes around 50,000 AF of effective agricultural water per inch of rain. Most rainfall occurs from November through March; however, summer storms can be significant in some years. Annual areawide rainfall is shown in **Table 5**. The thirty-year, 1990-2019, average annual air temperature was 73.6°F and average annual rainfall was 2.82 inches, see **Table 4** and **Table 3**. This record shows that while average annual rainfall has fluctuated, the 10-year average temperatures have slightly increased over the 30-year averages.

Imperial Valley depends on the Colorado River for its water, which IID transports, untreated, to delivery gates for agricultural, municipal, industrial (including geothermal and solar energy), environmental (managed marsh), recreational (lakes), and other non-agricultural uses. IID supplies the cities, communities, institutions and Golden State Water (which includes all or portions of Calipatria, Niland, and some adjacent Imperial County territory) with untreated water that they treat to meet state and federal drinking water guidelines before distribution to their customers. Industries outside the municipal areas treat the water to required standards of their industry. To comply with U.S. Environmental Protection Agency (USEPA) requirements and avoid termination of canal water service, residents in the IID water service area who do not receive treated water service must obtain alternative water service for drinking and cooking from a state-approved provider. To avoid penalties that could exceed \$25,000 a day, IID strictly enforces this rule. The IID Water Department tracks nearly 4,000 raw water service accounts required by the California Department of Public Health (CDPH) to have alternate state approved drinking water service. IID maintains a small-acreage pipe and drinking water database and provides an annual compliance update to CDPH.

## 7.2 IMPERIAL VALLEY HISTORIC AND FUTURE LAND AND WATER USES

Agricultural development in the Imperial Valley began at the turn of the twentieth century. In 2019, gross agricultural production for Imperial County was valued at \$2,015,843,000 of which approximately \$1,693,308,120 was produced in the IID water service area.<sup>10</sup> While the agriculture-based economy is expected to continue, land use is projected to change somewhat over the years as industrial and/or alternative energy development and urbanization occur in rural areas and in areas adjacent to existing urban centers, respectively.

Imperial Valley's economy is gradually diversifying. Agriculture will likely continue to be the primary industry within the valley; however, two principal factors anticipated to reduce crop acreage are renewable energy (geothermal and solar) and urban development. Over the next twenty years, urbanization is expected to slightly decrease agriculture land use to provide space for an increase in residential, commercial and industrial uses. The transition from agricultural land use typically results in a net decrease in water demand for municipal, commercial, and solar energy development, and a net increase in water demand for geothermal energy development. Local energy resources include geothermal, wind, biomass and solar. The County General Plan provides for development of energy production centers or energy parks within Imperial County.<sup>8</sup> Alternative energy facilities will help California meet its statutory and regulatory goals for increasing renewable power generation and use and decrease water demands in Imperial County.

The IID Board has adopted the following policies and programs to address how to accommodate water demands under the terms of the QSA/Transfers Agreements and minimize potential negative impacts on agricultural water uses:

[Imperial Integrated Regional Water Management Plan \(IRWMP\)](#): Adopted by the board on December 18, 2012, and by the County of Imperial, to meet the basic requirement of California Department of Water Resources (CDWR) for an IRWMP. In all, 14 local agencies adopted the 2012 Imperial IRWMP.

[Interim Water Supply Policy for Non-Agricultural Projects](#): Adopted by the board on September 29, 2009, to ensure sufficient water will be available for new development, in particular, anticipated renewable energy projects until the board selects and implements capital development projects such as those considered in the Imperial IRWMP.

---

<sup>10</sup> <https://agcom.imperialcounty.org/wp-content/uploads/2020/12/2019-Crop-Report.pdf>

[Temporary Land Conversion Following Policy](#): adopted by the board on May 8, 2012, and revised on March 29, 2016, to provide a framework for a temporary, long-term following program to work in concert with the IWSP and IID’s coordinated land use/water supply strategy.

[Equitable Distribution Plan](#): adopted by the board on October 28, 2013, to provide a mechanism for IID to administer apportionment of the district’s quantified annual supply of Colorado River water; IID board approved a resolution repealing the Equitable Distribution Plan (EDP) on February 6, 2018.

In addition, water users within the IID service area are subject to the statewide requirement of reasonable and beneficial use of water under the California Constitution, Article X, section 2.

### 7.3 IMPERIAL INTEGRATED REGIONAL WATER MANAGEMENT PLAN (OCTOBER 2012)

The Imperial Integrated Regional Water Management Plan (IRWMP) serves as the governing document for regional water planning to meet present and future water resource needs and demands by addressing such issues as additional water supply options, demand management, and determination and prioritization of uses and classes of service provided. In November 2012, the Imperial County Board of Supervisors approved the Imperial IRWMP, and the City of Imperial City Council and the IID Board of Directors approved it in December 2012. Approval by these three (3) stakeholders meets the basic requirement of California Department of Water Resources (CDWR) for an IRWMP. Through the IRWMP process, IID presented to the region stakeholders options in the event long-term water supply augmentation is needed, such as water storage and banking, recycling of municipal wastewater, and desalination of brackish water<sup>11</sup>. As discussed herein, long term water supply augmentation is not anticipated to be necessary to meet proposed Project demands.

Chapter 5 of the 2012 Imperial IRWMP addresses water supplies (Colorado River and groundwater), demand, baseline and forecasted through 2050, and IID water budget. Chapter 12 addresses projects, programs and policies, and funding alternatives. Chapter 12 of the IRMWP lists, and Appendix N details, a set of capital projects that IID might pursue, including the amount of water that might result (AFY) and cost (\$/AF) if necessary. These also highlight potential capital improvement projects that could be implemented in the future.

---

<sup>11</sup> October 2012 [Imperial Integrated Regional Water Management Plan](#), Chapter 12.

Imperial Valley historic non-agricultural water demand for 2015 and forecasted future for 2020 to 2055 are provided in **Table -8** in five-year increments. Total water demand for non-agricultural uses is projected to be 199.3 KAF in the year 2055. This is a forecasted increase in the use of non-agricultural water from 107.2 KAF for the period of 2015 to 2055.<sup>12</sup> These values were modified from Chapter 5 of the Imperial IRWMP to reflect updated conditions from the IID Provisional Water Balance for calendar year 2015. Due to the recession in 2009 and other factors, non-agricultural growth projections have lessened since the 2012 Imperial IRWMP. *Projections in Table 8 have been adjusted have been adjusted (reduced by 3%) to reflect IID 2015 delivery data.*

**Table 8: Non-Agricultural Water Demand within IID Water Service Area, 2015-2055 (KAFY)**

	2015	2020	2025	2030	2035	2040	2045	2050	2055
<b>Municipal</b>	30.0	33.9	36.8	39.8	41.5	46.3	51.7	57.8	61.9

<b>Envr Resources</b>	8.3	12.0	12.0	12.0	12.0	12.0	12.0	12.0	12.0
<b>Recreation</b>	7.4	7.0	7.0	7.0	7.0	7.0	7.0	7.0	7.0
<b>Service Pipes</b>	12.0	12.0	12.0	12.0	12.0	12.0	12.0	12.0	12.0
<b>Total Non Ag</b>	<b>107.4</b>	<b>123.5</b>	<b>133.3</b>	<b>142.8</b>	<b>151.2</b>	<b>162.7</b>	<b>174.8</b>	<b>187.6</b>	<b>198.4</b>

Notes: 2015 non-agricultural water demands are from IID 2015 Provisional Water Balance rerun 03/28/2019 2020-2055 demands are modified from 2012 Imperial IRWMP Chapter 5, Table 5-22 p 5-50 based on IID 2015 Provisional Water Balance. Industrial Demand includes geothermal, but not solar, energy production.

Agricultural evapotranspiration (ET) demand of approximately 1,476.4 KAF in 2015, decreased in 2019 to around 1,494.9 KAF. The termination of fallowing programs provided 103.5 KAF of water for Salton Sea mitigation in 2017. Forecasted agricultural ET remains constant, as reductions in water use are to come from efficiency conservation not reduction in agricultural production. Market forces and other factors may impact forecasted future water demand.

**Table 9** provides the 2015 historic and 2020-2055 forecasted agricultural consumptive use and delivery demand within the IID water service area. When accounting for agriculture ET, tailwater and tilewater, total agricultural consumptive use (CU) demand ranges from 2,157.9 KAF in 2015 to 2,209.5 KAF in 2055. Forecasted total agricultural delivery demand is around 1 KAFY higher than the CU demand, ranging from 2,158.9 KAF in 2015 to 2,210.5 KAF in 2055.

<sup>12</sup> [Wistaria Solar Ranch, Final Environmental Impact Report](#), December 2014

Notes: 2015 record from IID 2015 Provisional Water Balance rerun 06/28/2019; 2020-2055 forecasts from spreadsheet used to develop Figure 19, et seq. in Imperial IRWMP Chapter 5 (Data provided by IID staff). Next Update 2021

In addition to agricultural and nonagricultural water demands, system operational demands must be included to account for operational discharge, main and lateral canal seepage; and for All American Canal (AAC) seepage, river evaporation and phreatophyte ET from Imperial Dam to IID's measurement site at AAC Mesa Lateral 5. These system operation demands are shown in **Table 10**. IID measures system operational uses at All-American Canal Station 2900 just upstream of Mesa Lateral 5 Heading. Total system operational use for 2019 was 257.9 KAF, including 10 KAF of LCWSP input, 39.8 KAF of seepage interception input, and 30.9 KAF of unaccounted canal water input.

**Table 10: IID System Operations Consumptive Use within IID Water Service Area and from AAC at Mesa Lateral 5 to Imperial Dam, (KAF), 2019**

## 7.4 IID INTERIM WATER SUPPLY POLICY FOR NON-AGRICULTURAL PROJECTS (SEPTEMBER 2009)

The IID IWSP provides a mechanism to address water supply requests for projects being developed within the IID service area. The IWSP designates up to 25,000 AFY of IID’s annual Colorado River water supply for new non-agricultural projects, provides a mechanism and process to develop a water supply agreement for any appropriately permitted project, and establishes a framework and set of fees to ensure the supplies used to meet new demands do not adversely affect existing users by funding water conservation or augmentation projects as needed.<sup>13</sup>

Depending on the nature, complexity, and water demands of the proposed project, new projects may be charged a one-time Reservation Fee and an annual Water Supply Development Fee for the contracted water volume used solely to assist in funding new water supply projects. The applicability of the fee to certain projects will be determined by IID on a case-by-case basis, depending on the proportion of types of land uses and water demand proposed for a project. The 2019 fee schedule is shown in **Table 11**.

**Table 11: Interim Water Supply Policy 2019 Annual Non-Agricultural Water Supply Development Fee Schedule**

Annual Demand (AF)	Reservation Fee (\$/AF)*	Development Fee (\$/AF)*
0-500	\$73.15	\$292.62
501-1000	\$103.00	\$412.00
1001-2500	\$129.34	\$517.34
2501-5000	\$159.77	\$639.07

Adjusted annually in accordance with the Consumer Price Index (CPI).

IID customers with new projects receiving water under the IWSP will be charged the appropriate water rate based on measured deliveries, see [IID Water Rate Schedules](#). As of January 2021, IID has issued one Water Supply Agreement for 1,200 AFY, leaving a balance of 23,800 AFY of supply available for contracting under the IWSP.

<sup>13</sup> IID website: [Municipal, Industrial and Commercial Customers](#).

## 7.5 IID TEMPORARY LAND CONVERSION FOLLOWING POLICY (MAY 2012)

Imperial County planning officials determined that renewable energy facilities were consistent with the county's agricultural zoning designation and began issuing CUPs for these projects with ten- to twenty-year terms. These longer-term, but temporary, land use designations were not conducive to a coordinated land use/water supply policy as envisioned in the Imperial IRWMP, because temporary water supply assignments during a conditional use permit (CUP) term were not sufficient to meet the water supply verification requirements for new project approvals. Agricultural landowners also sought long-term assurances from IID that, at project termination, irrigation service would be available for them to resume their farming operations.

Based on these conditions, IID determined it had to develop a water supply policy that conformed to the local land use decision-making in order to facilitate new development and economic diversity in Imperial County which has resulted in the IID Temporary Land Conversion Following Policy (TLCFP).<sup>14</sup> IID concluded that certain lower water use projects could still provide benefits to local water users. The resulting benefits; however, may not be to the same categories of use (e.g., MCI) but to the district as a whole.

At the general manager's direction, staff developed a framework for a fallowing program that could be used to supplement the IWSP and meet the multiple policy objectives envisioned for the coordinated land use/water supply strategy. Certain private projects that, if implemented, will temporarily remove land from agricultural production within the district's water service area include renewable solar energy and other non-agricultural projects. Such projects may need a short-term water supply for construction and decommissioning activities and longer-term water service for facility operation and maintenance or for treating to potable water standards. Conserved water will be credited to the extent that water use for the project is less than historic water use for the project site's footprint as determined by the ten year water use history.<sup>15</sup>

Water demands for certain non-agricultural projects are typically less than that required for agricultural production. This reduced demand allows water to be made available for other users under IID's annual consumptive use cap. This allows the district to avail itself of the ability during the term of the QSA/Transfer Agreements under [CWC Section 1013](#) to create conserved water through projects such as temporary land

---

<sup>14</sup> IID website: [Temporary Land Conversion Following Policy \(TLCFP\)](#), and The [TLCFP](#) are the sources of the text for this section.

<sup>15</sup> For details of how water conservation yield attributable to land removed from agricultural production and temporarily fallowed is computed, see [TLCFP for Water Conservation Yield](#).

following conservation measures. This conserved water can then be used to satisfy the district’s conserved water transfer obligation and for environmental mitigation purposes.

Under the terms of the legislation adopted to facilitate the QSA/Transfer Agreements and enacted in CWC Section 1013, the TLCFP was adopted by the IID board on May 8, 2012 and revised on March 29, 2016 to update the fee schedule for 2016. This policy provides a framework for a temporary, long-term following program to work in concert with the IWSP. While conserved water generated from the TLCFP is limited by law for use for water transfer or environmental purposes, by satisfying multiple district objectives the TLCFP serves to reduce efficiency conservation and water use reduction demands on IID water users, thus providing district wide benefits.

## 7.6 IMPERIAL IRRIGATION DISTRICT’S WATER RIGHTS

The laws and regulations that influence IID’s water supply are noted in this section. The Law of the River (as described below), along with the 2003 Quantification Settlement Agreement and Related Agreements serve as the laws, regulations and agreements that primarily influence the findings of this WSA. These agreements grant California the most senior water rights along the Colorado River and IID specify that IID has access to 3.1 MAF per year. These two components will influence future decisions in terms of water supply during periods of shortages.

### CALIFORNIA LAW

IID’s has a longstanding right to divert Colorado River water, and IID holds legal titles to all of its water and water rights in trust for landowners within the district (CWC §20529 and §22437; *Bryant v. Yellen*, 447 U.S. 352, 371 (1980), fn.23.). Beginning in 1885, a number of individuals, as well as the California Development Company, made a series of appropriations of Colorado River water under California law for use in the Imperial Valley. The rights to these appropriations were among the properties acquired by IID from the California Development Company.

### LAW OF THE RIVER

Colorado River water rights are governed by numerous compacts, state and federal laws, court decisions and decrees, contracts, and regulatory guidelines collectively known as the “Law of the River.” Together, these documents form the basis for allocation of the water, regulation of land use, and management of the Colorado River water supply among the seven basin states and Mexico.

Of all regulatory literature that governs Colorado River water rights, the following are the specifics that impact IID:

- Colorado River Compact (1922)
- Boulder Canyon Project Act (1928)
- California Seven-Party Agreement (1931)
- Arizona v. California US Supreme Court Decision (1964, 1979)
- Colorado River Basin Project Act (1968)
- Quantification Settlement Agreement and Related Agreements (2003)
- 2003 Colorado River Water Delivery Agreement: Federal QSA for purposes of Section 5(b) Interim Surplus Guidelines (CRWDA)
- 1970 Criteria for Coordinated Long-Range Operation of Colorado River Reservoirs
- Annual Operating Plan (AOP) for Colorado River Reservoirs
- 2007 Colorado River Interim Guidelines for Lower Basin Shortages and Coordinated Operations for Lakes Powell and Mead (2007 Interim Guidelines)

### **COLORADO RIVER COMPACT (1922)**

With authorization of their legislatures and urging of the federal government, representatives from the seven Colorado River basin states began negotiations regarding distribution of water from the Colorado River in 1921. In November 1922, an interstate agreement called the “Colorado River Compact” was signed by the representatives giving the Lower Basin perpetual rights to annual apportionments of 7.5 million acre-feet (MAF) of Colorado River water (75 MAF over ten years). The Upper Basin was to receive the remainder, which based on the available hydrological record was also expected to be 7.5 MAF annually, with enough left over to provide 1.5 MAF annually to Mexico.

### **BOULDER CANYON PROJECT ACT (1928)**

Provisions in the 1928 Boulder Canyon Project Act made the compact effective and authorized construction of Hoover Dam and the All-American Canal, and served as the United States’ consent to accept the Compact. Through a Presidential Proclamation on June 25, 1929, this act resulted in ratification of the Compact by six of the basin states and required California to limit its annual consumptive use to 4.4 MAF of the lower basin’s apportionment plus not less than half of any excess or surplus water unapportioned by the Compact. A lawsuit was filed by the State of Arizona after its refusal to sign. Through the implementation of its 1929 Limitation Act, California abided by this federal mandate. The Boulder Canyon Act authorized the Secretary of the Interior (Secretary) to “contract for the storage of water... and for the delivery thereof... for irrigation and domestic uses,” and additionally defined the lower basin’s 7.5 MAF apportionment split, with an annual allocation 0.3 MAF to Nevada, 2.8 MAF to Arizona, and 4.4 MAF to California. Even though the three states never formally settled or agreed to these terms, a 1964 Supreme Court decision (*Arizona v. California*, 373

U.S. 546) declared the three states' consent to be insignificant since the Boulder Canyon Project Act was authorized by the Secretary.

#### **CALIFORNIA SEVEN-PARTY-AGREEMENT (1931)**

Following implementation of the Boulder Canyon Project Act, the Secretary requested that California make recommendations regarding distribution of its apportionment of Colorado River water. In August 1931, under chairmanship of the State Engineer, the California Seven-Party Agreement was developed and authorized by the affected parties to prioritize California water rights. The Secretary accepted this agreement and established these priorities through General Regulations issued in September of 1931. The first four (4) priority allocations account for California's annual apportionment of 4.4 MAF, with agricultural entities using 3.85 MAF of that total. Additional priorities are defined for years in which the Secretary declares that excess waters are available.

#### **ARIZONA V. CALIFORNIA U.S. SUPREME COURT DECISION (1964, 1979)**

The 1964 Supreme Court decision settled a 25-year disagreement between Arizona and California that stemmed from Arizona's desire to build the Central Arizona Project to enable use of its full apportionment. California's argument was that as Arizona used water from the Gila River, which is a Colorado River tributary, it was using a portion of its annual Colorado River apportionment. An additional argument from California was that it had developed a historical use of some of Arizona's apportionment, which, under the doctrine of prior appropriation, precluded Arizona from developing the project. California's arguments were rejected by the U.S. Supreme Court. Under direction of the Supreme Court, the Secretary was restricted from delivering water outside of the framework of apportionments defined by law. Preparation of annual reports documenting consumptive use of water in the three lower basin states was also mandated by the Supreme Court. In 1979, present perfected water rights (PPRs) referred to in the Colorado River Compact and in the Boulder Canyon Project Act were addressed by the Supreme Court in the form of a Supplemental Decree.

In March of 2006, a Consolidated Decree was issued by the Supreme Court to provide a single reference to the conditions of the original 1964 decrees and several additional decrees in 1966, 1979, 1984 and 2000 that stemmed from the original ruling. The Consolidated Decree also reflects the settlements of the federal reserved water rights claim for the Fort Yuma Indian Reservation.

**COLORADO RIVER BASIN PROJECT ACT (1968)**

In 1968, various water development projects in both the upper and lower basins, including the Central Arizona Project (CAP) were authorized by Congress. Under the Colorado River Basin Project Act, priority was given to California's apportionment over (before) the CAP water supply in times of shortage. Also under the act, the Secretary was directed to prepare long-range criteria for the Colorado River reservoir system in consultation with the Colorado River Basin States.

**QUANTIFICATION SETTLEMENT AGREEMENT AND RELATED AGREEMENTS (2003)**

With completion of a large portion of the CAP infrastructure in 1994, creation of the Arizona Water Banking Authority in 1995, and the growth of Las Vegas in the 1990s, California encountered increasing pressure to live within its rights under the Law of the River. After years of negotiating among Colorado River Compact States and affected California water delivery agencies, a Quantification Settlement Agreement and Related Agreements and documents were signed on October 10, 2003, by the Secretary of Interior, IID, Coachella Valley Water District (CVWD), Metropolitan Water District of Southern California (MWD), San Diego County Water Authority (SDCWA), and other affected parties.

The Quantification Settlement Agreement and Related Agreements (QSA/Transfer Agreements) are a set of interrelated contracts that resolve certain disputes among the United States, the State of California, IID, MWD, CVWD and SDCWA, for a period of 35 to 75 years, regarding the reasonable and beneficial use of Colorado River water; the ability to conserve, transfer and acquire conserved Colorado River water; the quantification and priority of Priorities 3(a) and 6(a)<sup>16</sup> within California for use of Colorado River water; and the obligation to implement and fund environmental impact mitigation.

---

<sup>16</sup> Priorities 1, 2, 3(b), 6(b), and 7 of current Section 5 Contracts for the delivery of Colorado River water in the State of California and Indian and miscellaneous Present Perfected Rights within the State of California and other existing surplus water contracts are not affected by the QSA Agreement.

Conserved water transfer agreements between IID and SDCWA, IID and CVWD, and IID and MWD are all part of the QSA/Transfer Agreements. For IID, these contracts identify conserved water volumes and establish transfer schedules along with price and payment terms. As specified in the agreements, IID will transfer nearly 415,000 AF annually over a 35-year period (or longer), as follows:

- to MWD 110,000 AF [modified to 105,000 AF in 2007],
- to SDCWA 200,000 AF,
- to CVWD and MWD combined 103,000 AF, and
- to certain San Luis Rey Indian Tribes 11,500 AFY of water.

All of the conserved water will ultimately come from IID system and on-farm efficiency conservation improvements. In the interim, IID has implemented a Fallowing Program to generate water associated with Salton Sea mitigation related to the impacts of the IID/SDCWA water transfer, as required by the State Water Resources Control Board, which is to run from 2003 through 2017. In return for its QSA/Transfer Agreements programs and deliveries, IID will receive payments totaling billions of dollars to fund needed efficiency conservation measures and to pay growers for conserved on-farm water, so IID can transfer nearly 14.5 MAF of water without impacting local productivity. In addition, IID will transfer to SDCWA 67,700 AFY annually of water conserved from the lining of the AAC in exchange for payment of lining project costs and a grant to IID of certain rights to use the conserved water. In addition to the 105,000 acre-feet of water currently being conserved under the 1988 IID/MWD Conservation Program, these more recent agreements define an additional 303,000 AFY to be conserved by IID from on-farm and distribution system conservation projects for transferred to SDCWA, CVWD, and MWD.

#### **COLORADO RIVER WATER DELIVERY AGREEMENT (2003)<sup>17</sup>**

As part of QSA/Transfer Agreements among California and federal agencies, the Colorado River Water Delivery Agreement: Federal QSA for purposes of Section 5(b) Interim Surplus Guidelines (CRWDA) was entered into by the Secretary of the Interior, IID, CVWD, MWD and SDCWA. This agreement involves the federal government because of the change in place of diversion from Imperial Dam into the All-American Canal to Parker Dam into MWD's Colorado River Aqueduct.

The CRWDA assists California to meet its "4.4 Plan" goals by quantifying deliveries for a specific number of years for certain Colorado River entitlements so transfers may occur. In particular, for the term of the CRWDA, quantification of Priority 3(a) was effected through caps on water deliveries to IID (consumptive

---

<sup>17</sup> [\*CRWDA: Federal QSA\*](#) accessed 7 June 2017.

use of 3.1 MAF per year) and CVWD (consumptive use of 330 KAF per year). In addition, California’s Priority 3(a) apportionment between IID and CVWD, with provisions for transfer of supplies involving IID, CVWD, MWD and SDCWA are quantified in the CRWDA for a period of 35 years or 45 years (assumes SDCWA does not terminate in year 35) or 75 years (assumes SDCWA and IID mutually consent to renewal term of 30 years).

Allocations for consumptive use of Colorado River water by IID, CVWD and MWD that will enable California to stay within its basic annual apportionment (4.4 MAF plus not less than half of any declared surplus) are defined by the terms of the QSA/Transfer Agreements (**Table 12**). As specified in the QSA/Transfer Agreements, by 2026, IID annual use within (Imperial Valley) is to be reduced to just over 2.6 MAF of its 3.1 MAF quantified annual apportionment. The remaining nearly 500,000 AF (which includes the 67,000 AF from AAC lining) are to be transferred annually to urban water users outside of the Imperial Valley.

**Table 12: CRWDA Annual 4.4 MAF Apportionment (Priorities 1 to 4) for California Agencies (AFY)**

User	Apportionment (AFY)
Palo Verde Irrigation District and Yuma Project*	420,000
Imperial Irrigation District	3,100,000
Coachella Valley Water District	330,000
Metropolitan Water District of Southern California*	550,000
Total:	4,400,000

\* PVID and Yuma Project did not agree to a cap; value represents a contractual obligation by MWD to assume responsibility for any overages or be credited with any volume below this value.

Notes: All values are consumptive use at point of Colorado River diversion: Palo Verde Diversion Dam (PVID), Imperial Dam (IID and CVWD), and Parker Dam (MWD). Source: IID Annual Water Report

Quantification of Priority 6(a) was effected through quantifying annual consumptive use amounts to be made available in order of priority to MWD (38 KAF), IID (63 KAF), and CVWD (119 KAF) with the provision that any additional water available to Priority 6(a) be delivered under IID’s and CVWD’s existing water delivery contract with the Secretary.<sup>18</sup> The CRWDA provides that the underlying water delivery contract with the Secretary remain in full force and effect. (*Colorado River Documents 2008*, Chapter 6, pages 6-12 and 6-13). The CRWDA also provides a source of water to effect a San Luis Rey Indian Water rights settlement. Additionally, the CRWDA satisfies the requirement of the 2001 Interim Surplus Guidelines (ISG) that a QSA be adopted as a prerequisite to the interim surplus determination by the Secretary in the ISG.

#### INADVERTENT OVERRUN PAYBACK POLICY (2003)

<sup>18</sup> When water levels in the Colorado River reservoirs are low, Priority 5, 6 and 7 apportionments are not available for diversion.

The CRWDA Inadvertent Overrun Payback Policy (IOPP), adopted by the Secretary contemporaneously with the execution of the CRWDA, provides additional flexibility to Colorado River management and applies to entitlement holders in the Lower Division States (Arizona, California and Nevada).<sup>19</sup> The IOPP defines inadvertent overruns as “Colorado River water diverted, pumped, or received by an entitlement holder of the Lower Division States that is in excess of the water users’ entitlement for the year.” An entitlement holder is allowed a maximum overrun of 10 percent (10%) of its Colorado River water entitlement.

In the event of an overrun, the IOPP provides a mechanism to payback the overrun. When the Secretary has declared a normal year for Colorado River diversions, a contractor has from one to three years to pay back its obligation, with a minimum annual payback equal to 20 percent of the entitlement holder’s maximum allowable cumulative overrun account or 33.3 percent of the total account balance, whichever is greater. However, when Lake Mead is below 1125 feet on January 1, the terms of the IOPP require that the payment of the inadvertent overrun obligation be made in the calendar year after the overrun is reported in the USBR Lower Colorado Region Colorado River Accounting and Water Use Report [for Arizona, California, and Nevada (Decree Accounting Report)].<sup>20</sup>

### 1970 CRITERIA FOR COORDINATED LONG-RANGE OPERATION OF COLORADO RIVER RESERVOIRS

The 1970 Operating Criteria control operation of the Colorado River reservoirs in compliance with requirements set forth in the Colorado River Compact of 1922, the United States-Mexico Water Treaty of 1944, the Colorado River Storage Project Act of 1956, the Boulder Canyon Projects Act (Lake Mead) and the Colorado River Basin Project Act (Upper Basin Reservoirs) of 1968, and other applicable federal laws. Under these Operating Criteria, the Secretary makes annual determinations published in the USBR Annual Operating Plan for Colorado River Reservoirs (discussed below) regarding the release of Colorado River water for deliveries to the lower basin states. A requirement to equalize active storage between Lake Powell and Lake Mead when there is sufficient storage in the Upper Basin is included in these operating criteria. **Figure 5** identifies the major storage facilities at the upper and lower basin boundaries.

### ANNUAL OPERATING PLAN FOR COLORADO RIVER RESERVOIRS (Applicable Only if Lake Mead has Surplus/Shortage)

<sup>19</sup> USBR, 2003 CRWDA ROD Implementation Agreement, IOPP and Related Federal Actions Final EIS. Section IX. Implementing the Decision A. Inadvertent Overrun and Payback Policy. Pages 16-19 of 34.

<sup>20</sup> 2003 [CRWDA ROD](#). Section IX. A.6.c., page 18 of 34.

The AOP is developed in accordance with Section 602 of the Colorado River Basin Project Act (Public Law 90-537); the Criteria for Coordinated Long-Range Operations of Colorado River Reservoirs Pursuant to the Colorado River Basin Project Act of 1968, as amended, promulgated by the Secretary of the Interior; and Section 1804(c)(3) of the Grand Canyon Protection Act (Public Law 102-575). As part of the AOP process, the Secretary makes determinations regarding the availability of Colorado River water for deliveries to the lower basin states, including whether normal, surplus, and shortage conditions are in effect on the lower portion of the Colorado River.

### 2007 COLORADO RIVER INTERIM GUIDELINES FOR LOWER BASIN SHORTAGES (2007 INTERIM GUIDELINES)

A multi-year drought in the Colorado River Upper Basin triggered the need for the 2007 Interim Shortage Guidelines. In the summer of 1999, Lake Powell was essentially full with reservoir storage at 97 percent of capacity. However, precipitation fell off starting in October 1999 and 2002 inflow was the lowest recorded since Lake Powell began filling in 1963.<sup>21,22</sup> By August 2011, inflow was 279 percent (279%) of average; however, drought resumed in 2012 and continued through calendar year 2018. Using the record in **Table 13**, average unregulated inflow to Lake Powell for water years 2000-2017 is 74 percent (74%); or if 2011 is excluded, 70 percent (70%) of the historic average, see **Table 13**.

**Table 13: Unregulated Inflow to Lake Powell, Percent of Historic Average, 2000-2019**

2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010

Figure 5 Major Colorado River Reservoir Storage Facilities and Basin Location Map

Source: [Final EIS – Colorado River Interim Guidelines for Lower Basin Shortages and Coordinated Operations for Lake Powell and Lake Mead, Volume 1 Chapter 1 Purpose and Need](#) , p I-10.

In the midst of the drought period, USBR developed 2007 Interim Guidelines with consensus from the seven basin states, which selected the Draft EIS Preferred Alternative as the basis for USBR’s final determination. The basin states found the Preferred Alternative best met all aspects of the purpose and need for the federal action..<sup>23</sup>

**The 2007 interim Guidelines Preferred Alternative highlights the following:**

1. The need for the Interim Guidelines to remain in place for an extended period of time.
2. The desirability of the Preferred Alternative based on the facilitated consensus recommendation from the basin states.
3. The likely durability of the mechanisms adopted in the Preferred Alternative in light of the extraordinary efforts that the basin states and water users have undertaken to develop implementing agreements that will facilitate the water management tools (shortage sharing, forbearance, and conservation efforts) identified in the Preferred Alternative
4. That the range of elements in the Preferred Alternative will enhance the Secretary’s ability to manage the Colorado River reservoirs in a manner that recognizes the inherent tradeoffs between water delivery and water storage.

In June 2007, USBR announced that a preferred alternative for Colorado River Interim Guidelines for Lower Basin Shortages and Coordinated Operations of Lake Powell and Lake Mead (Final Preferred Alternative) had been determined. The Final Preferred Alternative, based on the basin states’ consensus alternative and an alternative submitted by the environmental interests called “Conservation Before Shortage,” is comprised of four key operational elements which are to guide operations of Lake Powell and Lake Mead through 2026 are:

1. Shortage strategy for Lake Mead and Lower Division states: The Preferred Alternative proposed discrete levels of shortage volumes associated with Lake Mead elevations to conserve reservoir storage and provide water users and managers in the Lower Basin with greater certainty to know when, and by how much, water deliveries will be reduced during low reservoir conditions.

---

<sup>23</sup> USBR *Colorado River Interim Guidelines for Lower Basin Shortages and Coordinated Operations for Lake Powell and Lake Mead* <<http://www.usbr.gov/lc/region/programs/strategies.html>>

2. Coordinated operations of Lake Powell and Lake Mead: The Preferred Alternative proposed a fully coordinated operation of the reservoirs to minimize shortages in the Lower Basin and to avoid risk of curtailments of water use in the Upper Basin.
3. Mechanism for storage and delivery of conserved water in Lake Mead: The Preferred Alternative proposed the Intentionally Created Surplus (ICS) mechanism to provide for the creation, accounting, and delivery of conserved system and non-system water thereby promoting water conservation in the Lower Basin. Credits for Colorado River or non-Colorado River water that has been conserved by users in the Lower Basin creating an ICS would be made available for release from Lake Mead at a later time. The total amount of credits would be 2.1 MAF, but this amount could be increased up to 4.2 MAF in future years.
4. Modifying and extending elements of the Interim Surplus Guidelines (ISG). The ISG determines conditions under which surplus water is made available for use within the Lower Division states. These modifications eliminate the most liberal surplus conditions thereby leaving more water in storage to reduce the severity of future shortages.

With respect to the various interests, positions and views of the seven basin states, this provision adds an important element to the evolution of the legal framework for prudent management of the Colorado River. Furthermore, the coordinated operation element allows for adjustment of Lake Powell releases to respond to low reservoir storage conditions in either Lake Powell or Lake Mead<sup>24</sup>. States found the Preferred Alternative best met all aspects of the purpose and need for the federal action.<sup>25</sup> The 2007 Interim Guidelines are in place from 2008 through December 31, 2025 (through preparation of the 2026 Annual Operating Plan). Reclamation's Upper and Lower Colorado Basin Regions manage the operations of Lake Powell and Lake Mead pursuant to the Record of Decision for the 2007 Interim Guidelines.

## LOWER COLORADO REGION WATER SHORTAGE OPERATIONS

The drought in the Colorado River watershed has continued through 2019 despite an increase in observed runoff in August 2011 when unregulated inflow to Lake Powell was 279 percent of the average. Since 2000,

---

<sup>24</sup> For a discussion of the 2007 Interim Guidelines, see: [Intermountain West Climate Summary](#) by The Western Water Assessment, issued Jan. 21, 2008, Vol. 5, Issue 1, January 2009 Climate Summary, Feature Article, pages 5-7, 22 Mar 2013.

<sup>25</sup> [USBR Colorado River Interim Guidelines for Lower Basin Shortages and Coordinated Operations for Lake Powell and Lake Mead](#).

Lake Mead has been below the “average” level of lake elevations (see **Figure 6**). Such conditions have caused the preparation of shortage plans for waters users in Arizona and Nevada, and in Mexico.

**Figure 6 Lake Mead Water Elevation Levels 2020**

visit <http://www.arachnoid.com/NaturalResources/index.html>

According to guidelines put in place in 2007, Arizona and Nevada begin to take shortages when the water elevation in Lake Mead falls below 1,075 feet. The volumes of shortages increase as water levels fall to 1,050 feet and again at 1,025 feet. In 2012, Mexico agreed to participate in a 5-year pilot agreement to share specific volumes of shortages at the same elevations. The 2007 interim shortage guidelines contain no reductions for California, which has senior water rights to the Central Arizona Project water supply, through 2025 when the guidelines expire. If Lake Mead's elevation drops to 1,025 feet, a re-consultation process would be triggered among the basin states to address next steps. Consultation would start out within each state, then move to the three lower basin states, followed by all seven states and the USBR. Mexico will then be brought into the process unless they choose to participate earlier.

## 8 IMPERIAL IRRIGATION DISTRICT WATER SUPPLY AND DEMAND

SB 610 requires an analysis of a normal, single dry, and multiple dry water years to show that adequate water is available for the proposed Project in various climate scenarios. Water availability for this Project in a normal year is no different from water availability during a single-dry and multiple-dry year scenarios.

This is due to the small effect rainfall has on water availability in IID’s arid environment along with IID’s strong entitlements to the Colorado River water supply. Local rainfall does have some impact on how much water is consumed (i.e. if rain falls on agricultural lands, those lands will not demand as much irrigation), but does not impact the definition of a normal year, a single-dry year or a multiple-dry year scenario.

## 9 WATER AVAILABILITY – NORMAL YEAR

---

IID is entitled to annual net consumptive use of 3.1 MAF of Colorado River, less its QSA/Transfer Agreement obligations. Imperial Dam, located north of Yuma, Arizona, serves as a diversion structure for water deliveries throughout southeastern California, Arizona and Mexico. Water is transported to the IID water service area through the AAC for use throughout the Imperial Valley. IID historic and forecast net consumptive use volumes at Imperial Dam from CRWDA Exhibit B are shown in **Table 14**. Volumes 2003-2019 are adjusted for USBR Decree Accounting historic records. Volumes for 2020-2077 are from CRWDA Exhibit B modified to reflect 2014 Letter Agreement changes to the 1988 IID/MWD Water Conservation Agreement.<sup>26</sup>

### 9.1 GROUNDWATER, AGRICULTURAL PRACTICES AND DRAINAGE

Groundwater underlying the Imperial Valley is generally of poor quality unsuitable for domestic or irrigation purposes. Groundwater in the area of the project is brackish (contains a high salt content). Agricultural practices in the Imperial Valley, including in the project vicinity, consist of aerial and ground application of pesticides and application of chemical fertilizers to both ground and irrigation water at the farm delivery gate. Most of the agricultural fields in the valley are underlain by tile drainage systems (perforated pipelines encapsulated by sand/gravel) installed at a depth of approximately 5 to 7 feet below the ground surface. The tile drains maintain groundwater at levels below the root system of crops. The tile drains transport soluble salts contained in the Colorado River water and that are leached from the soil profile during irrigation. The tile drainage is collected in IID’s drainage system, most of which discharges into the New and Alamo rivers and flows to the Salton Sea. A few IID drains discharge directly to the Salton Sea.

- 2003 through 2019, volumes are adjusted for actual USBR Decree Accounting values; IID Total Reduction and Net Available for Consumptive Use may not equal Col 2 minus Col 10, if IID conservation/use was not included in Exhibit B.
- 2014 Letter of Agreement provides that, effective January 2016 total amount of conserved water available is 105 KAFY
- Salton Sea Mitigation volumes may vary based on conservation volumes and method of conservation.
- This transfer is not likely given lack of progress on Salton Sea restoration as of 2018; shaded entries represents volumes that may vary..*
- Reductions include conservation for 1988 IID/MWD Transfer, IID/SDCWA Transfer, AAC Lining; SDCWA Transfer Mitigation, MWD Transfer w/Salton Sea Restoration (if any); Misc. PPRs. Amounts are independent of increases and reductions as allowed by the IOPP.
- Assumes SDCWA does not elect termination in year 35.
- Assumes SDCWA and IID mutually consent to renewal term of 30 years.
- Modified from 100 KAFY in CRWDA Exhibit B; stating in 2018 MWD will provide CVWD 50 KAFY of the 100 KAFY.

Source: [CRWDA: Federal QSA](#) Exhibit B, p 13; updated values from [2019 QSA Implementation Report](#)

Due to limits on annual consumptive use of Colorado River water under the QSA/Transfer Agreements, IID's water supply during a normal year is best represented by the CRWDA Exhibit B Net Available for Consumptive Use (Table 14, Column 11). The annual volume is IID Priority 3(a) Quantified Amount of 3.1 million acre-feet (MAF) (Table 14, Column 2) less the IID transfer program reductions for each year (Table

-14, Columns 3-9). IID suggests **Table 14** which assumes full use of IID’s quantified water supply, be used in determining base normal year water availability.

CRWDA Exhibit B Net Available for Consumptive Use volumes less system operation demand represents the amount of water available for delivery by IID Water Department to its customers each year. In a normal year, perhaps 50,000 to 100,000 AF of effective rainfall would fall in the IID water service area. However, rainfall is not evenly distributed throughout the IID water service area and is not taken into account by IID in the submittal of its Estimate of Diversion (annual water order) to the USBR.

## 10 EXPECTED WATER AVAILABILITY – SINGLE DRY AND MULTIPLE DRY YEARS

---

When drought conditions exist within the IID water service area, as has been the case for the past decade or so, the water supply available to meet agricultural and non-agricultural water demands remains the same as normal year water supply because IID continues to rely solely on its entitlement for Colorado River water. Due to the priority of IID water rights and other agreements, drought conditions affecting Colorado River water supplies cause shortages for Arizona, Nevada and Mexico, before impacting California and IID. Accordingly, the Net Available for Consumptive Use volumes in **Table 14, Column 11** represents the water supply at Imperial Dam available for diversion by IID in single-dry year and multiple-dry year scenarios.

Under CRWDA Inadvertent Overrun Payback Policy (IOPP), IID has some flexibility to manage its water use. When the water level in Lake Mead is above 1,125 feet, an overrun of its USBR approved annual water order is permissible, and IID has up to three years to pay water use above the annual water order. When Lake Mead’s water level is at or below 1,125 feet on January 1 in the calendar year after the overrun is reported in the USBR Lower Colorado Region Decree Accounting Report, the IOPP prohibits additional overruns and requires that outstanding overruns be paid back in the subsequent calendar year rather than in three years as allowed under normal conditions; that is, the payback is to be made in the calendar year following publication of the overrun in the USBR Decree Accounting Report. For historic IID annual rainfall, net consumptive use, transfers and IID underrun/overrun amounts see **Table 14**. For the purposes of the WSA, years with a shortage condition that impacts non-agricultural projects such as an IOPP payback obligation constitute “dry” years for IID.

In years of inadvertent overrun payback, conditions such as those in Sections 3.7 and 3.8 of the 2012 IWSP Water Agreement may go into effect, with the result that less water would be available for non-agricultural development contractors. Under such conditions, IID has requested that Consolidated Edison Development

(CED) (the “Applicant”), work with IID to ensure it can manage the reduction. IID has further indicated that, provided a water supply agreement is approved and executed by IID under the provisions of the IWSP, IID will have sufficient water to support the water of this Project.

**Table 15: IID Annual Rainfall (In), Net Consumptive Use and Underrun/Overrun Amounts (AF), 1988-2018**

Year	IID Total Annual Rainfall	IID Water Users	IID/MWD Transfer	IID/ SDCWA Transfer	SDCWA Transfer Salton Sea Mitigation	IID Underrun / Overrun	IID/CVWD Transfer	AAC Lining

## 10.1 EQUITABLE DISTRIBUTION PLAN

As previously noted, the Equitable Distribution Plan was repealed by the IID board on February 2018 as a result of a legal challenge that is still in the appeal process as of the date of this WSA. November 28, 2006, the IID Board of Directors adopted Resolution No 22-2006 approving development and implementation of an Equitable Distribution Plan to deal with times when customers' demand would exceed IID's Colorado River supply – scenarios such as 2 and 3, above. As part of this Resolution, the IID Board directed the General Manager to prepare the rules and regulations necessary or appropriate to implement the plan within the district, which the board adopted in November 2006. The 2009 Regulations for EDP were created to enable IID to implement a water management tool (apportionment) to address years in which water demand is expected to exceed supply. A 2006 study by Hanemann and Brookes suggested that such conditions were likely to occur 40-50% of the years during the decade following the report. So far, for the ten years from 2003 through 2012, demand has exceeded supply by some amount for a total of six years (see **Table 15**, above). IID has not experienced any overruns since 2014.

The EDP, adopted in 2007 allows the IID Board to institute an apportionment program. The 2006 Hanemann-Brookes study stated supply was likely to exceed demand "4 or 5 times out of the next 10 years".<sup>27</sup> In the eight years from 2004 through 2011, IID was accounted as overrunning its annual water limit four times and as noted above, as of 2013, IID had an outstanding overrun balance of over 200,000 AF. As of 2019, IID did not have any outstanding overruns.

An annual EDP Apportionment will be established for each subsequent year from a favorable court decision, if not for the duration of the QSA/Transfer Agreements. The IID 2013 Revised EDP, adopted by the Board on October 28, 2013, allows IID to pay back its outstanding overruns using EDP Apportionment, and it is expected that an annual EDP Apportionment will be established for each of the next several years, if not for the duration of the QSA/Transfer Agreements. For purposes of this WSA, years with a shortage condition that impacts non-agricultural projects such as an IOPP payback obligation constitute "dry" years for IID.

For single-dry year and multiple-dry water year assessments, not only does IID's EDP govern; but when but so may provisions like sections 3.7 and 3.8 of the 2012 IWSP Water Agreement, as stated above. IOPP

---

<sup>27</sup>Regarding the Equitable Distribution of Water in the Imperial Irrigation District Draft Final Report, Hanemann & Brookes, 2006, <<http://www.iid.com/Modules/ShowDocument.aspx?documentid=116>> 8 Feb 2013

payback, EDP Apportionment, and the IWSP are further discussed under single-dry and multiple-dry year projections.

## 10.2 WATER MANAGEMENT UNDER INADVERTENT OVERRUN PAYBACK POLICY (IOPP)

On January 1, 2013, the water level in Lake Mead was 1120.5 feet, and for the first time since the IOPP came into effect Lower Colorado River Basin water users faced a shortage condition (**Figure 6-IOPP Schematic**). For IID, this means that outstanding overruns must be paid back to the river in calendar years 2013 and 2014 as described below and shown in **Table 16**.

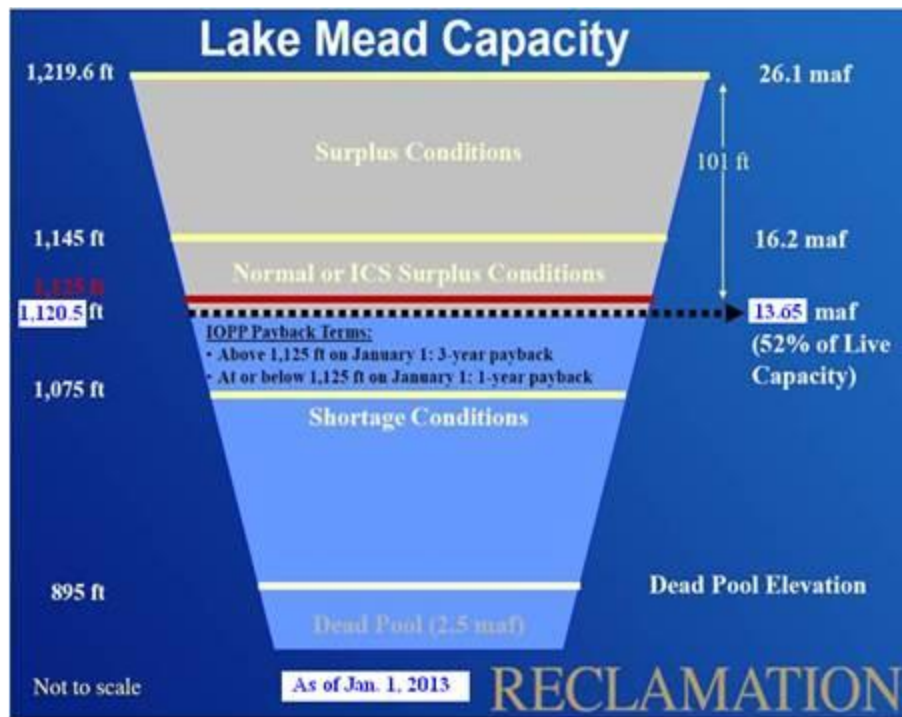

Figure 7 Lake Mead IOPP Schematic

IID's maximum allowable cumulative overrun account is 62,000 AF.<sup>28</sup> Thus, for IID's 2011 overrun of 82,662 AF (which was published in 2012), 62,000 AF were paid back at the river in calendar year 2013, with the remaining 20,662 AF paid back in 2014; however, due to an early payback of 6,290 AF in 2012, IID had 55,710 AF to pay back in 2013 and 20,662 AF of the 2011 overrun to pay back in 2014. In addition, because of the low level of Lake Mead on Jan 1, 2013, IID's entire 2012 overrun of 134,076 AF was paid back in

<sup>28</sup> For IID Quantified Amount: 3.1 MAFY \* 10 percent = 310,000 AF allowable cumulative overrun account amount; minimum repayment in a calendar year is the less of 310,000 \* 20 percent = 62,000 or the amount in the account, if less than 62,000 AF.

2014, for a total of 154,738 AF in 2014. Furthermore, under the terms of the IOPP, no overruns are allowed in year when payback is required. IID has not experienced an overrun since 2012.

**Table 16: IID Inadvertent Overrun Payback to the Colorado River under the IOPP, 2012-2019**

<b>Calendar Year of Payback</b>	<b>2011 Overrun Payback (AF)</b>	<b>2012 Overrun Payback (AF)</b>	<b>Payback Total for 2014 Calendar Year (AF)</b>
2013	55,710	-	55,710
2014	20,662	134,076	154,738
Total Payback	76,372	134,076	210,448

The 2013 IOPP payback obligation and prohibition on overruns in payback years, led the IID Board to implement an apportionment program pursuant to the 2009 Regulations for EDP, which were subsequently revised and modified. The Revised 2013 EDP was version approved and adopted by the IID Board on October 28, 2013 (see Attachment B). The Revised 2013 EDP also establishes an agriculture water clearinghouse to facilitate the movement of apportioned water between agricultural water users and between farm units. This is to allow growers and IID to balance water demands for different types of crops and soils with the apportionment s that are made. IID’s Water Conservation Committee agreed on a July 1, 2013 start date for the agricultural water clearinghouse

Generally, the EDP Apportionment is not expected to impact industrial use. However, given the possibility of continuing drought on the Colorado River and other stressors, provisions such as the 2012 IWSP Water Agreement sections 3.7 and 3.8 as well for dry and multiple dry year water assessment may come into effect. However, IID has agreed to work with project proponents to ensure to the extent possible that the IWSP Water Agreement terms will not negatively impact project operation.

## **11 PROJECT WATER AVAILABILITY FOR A 30-YEAR PERIOD TO MEET PROJECTED DEMANDS**

The proposed Project will obtain drinking water from a certified State of California provider. The Applicant will be purchasing all potable drinking water from a local certified vendor approved through Imperial County Environmental Health Services. Untreated Colorado River water will be supplied to the project via the adjacent WSM underunder IID’s Interim Water Supply Policy (IWSP) for non-agricultural projects or Schedule 7, General Industrial Water. Project Site and has not been farmed for the last 15 years. The Project totals to 163 Acres. Therefore by default, the proposed project would incur an increase in water usage.

The Project is proposing a General Plan Amendment and Rezone to change the land use designation and zoning for the Project site from Agriculture (A-3) to Industrial, with the Industrial zoning limited to Energy Production/Use.

As stated above the current land use for the project site is currently zoned A-3. The site does not currently receive water as shown in the historical data provided in **Table 18**. Although the site may have not used much water in the last 10 years, the site is able to receive water through the WSM Canal. The current gate (WSM Gate 6) is in operational condition, upgrades to any IID facilities will be designed and constructed by the IID Water Engineering Department.

Imperial County Entitlement Discretionary Permits Include:

- General Plan Amendment
- Zone Change
- Development Agreement
- Conditional Use Permit

As noted previously, under the terms of California legislation adopted to facilitate the QSA/Transfer Agreements and enacted in CWC Section 1013, the IID board adopted the TLCFP to address how to deal with any such temporary reduction of water use by projects like such as solar projects that are developed under a CUP.

While conserved water generated from the TLCFP is limited by law for use for water transfer or environmental purposes, by satisfying multiple district objectives the TLCFP serves to reduce the need for efficiency conservation and other water use reduction practices on the part of IID and its water users providing the district with wide benefits. One of the considerations in developing the TLCFP was to provide agricultural land owners with long-term assurances from IID that, at Project termination, irrigation service would be available for them to resume farming operations.

## 11.1 INTERIM WATER SUPPLY POLICY WATER

At the present time, IID is providing water for use by solar energy generation projects under Water Rate Schedule 7 General Industrial Use. If IID determines that the proposed Project should obtain water under IID's Interim Water Supply Policy (IWSP) for non-agricultural projects rather than Schedule 7 General Industrial Use, the Applicant will do so. IID will determine whether the Project should obtain water under IID's Interim Water Supply Policy (IWSP) for non-agricultural projects in addition to Schedule 7 General Industrial Water.

The IWSP, provided herein as Attachment A, designates up to 25,000 AFY of water for potential Non-Agricultural Projects within IID's water service area. As of June 2019, IID has 23,800 AF available under the IWSP for new projects such as the proposed project. The IWSP establishes a schedule for Processing Fees, Reservation Fees, and Connection Fees that change each year for all non-agricultural projects, and annual Water Supply Development fees for some non-agricultural projects. The proposed Project's water use will be subject to the annual Water Supply Development fee if IID determines that water for the Project is to be supplied under the IWSP.

The likelihood that IID will not receive its annual 3.1 MAF apportionment less QSA/Transfer Agreement obligations of Colorado River water is low due to the high priority of the IID entitlement relative to other Colorado River contractors; see IID's Water Rights section on **page 21**. If such reductions were to come into effect within the 30-year Project life, the Applicants are to work with IID to ensure any reduction can be managed.

As such, lower Colorado River water shortage does not present a material risk to the available water supply that would prevent the County from making the findings necessary to approve this WSA. IID, like any water provider, has jurisdiction to manage the water supply within its service area and impose conservation measures during a period of temporary water shortage. Furthermore, without the proposed Project, IID's task of managing water supply under the QSA/Transfer Agreements would be more difficult, because agricultural use on the proposed Project site would be significantly higher than the proposed demand for the proposed Project as explained in section Expected Water Demand for the Proposed Project that follows.

Water for construction (primarily for dust control) would be obtained from IID canals or laterals in conformance with IID rules and regulations for MCI temporary water use.<sup>29</sup> To obtain water delivery service, the Applicant will complete an IID-410 Certificate of Ownership and Authorization (Water Card), which allows the Water Department to provide the District with information needed to manage the District apportioned supply. Water cards are used for Agriculture, Municipal, Industrial and Service Pipe accounts.

---

<sup>29</sup> Complete the Application for Temporary Water Use and submit to Division office. Complete encroachment permit through Real Estate – non-refundable application fee of \$250, se. IID website: [Real Estate / Encroachments, Permissions, and Other Permitting](#). Fee for temporary service water: Schedule No. 7 General Industrial Use / Temporary Service Minimum charge for up to 5 AF, pay full flat fee for 5 AF at General Industrial Use rate (\$425); use more than 5 AF, pay fee for actual use at General Industrial Rate (\$85/AF).

If water is to be provided under IWSP in addition to Schedule 7, General Industrial Use, the Applicant will seek to enter into a IWSP Water Supply Agreement albeit currently fallowed land.

## 12 EXPECTED WATER DEMANDS FOR THE APPLICANT

Water for the Project will be needed on-site for construction, operations, and dust mitigation measures set forth by the County of Imperial. Raw Colorado River water will be supplied to the project via the adjacent canal **WSM canal (Gate 6)** under a water agreement with IID (Industrial Water Use Agreement, IWSP Water Supply Agreement), see **Table 17**. The project is anticipated to go through a Zone Change and General Plan Amendment. Please refer to Project Description. The proposed project is projected to increase the amount of water currently being used as recorded through IID Water History Logs. Project raw water uses are summarized in in **Table 17**.

*Table 17: Project Water Uses (AFY)*

Use	Acre-Feet Per Year
Raw Water for Construction (Years 1-10)	21.00*
Raw Water for Operations (Years 11-30)	11.20
Raw Water for Mitigation (Years 11-30)	3.07

(Construction water is Years 1-10,  $210/10=21$ , As Average.)\*

IID delivers untreated Colorado River water to the proposed Project site for agricultural uses through the following gates and laterals. The 10-year record for 2010-2019 of water delivery accounting is shown in

**Table 18: Ten- Year Historic Delivery (AFY), 2010-2019**

Canal/Gate	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019
WSM/6	00	00	00	4.9	00	00	00	00	00	00
<b>TOTAL</b>	0	0	0	4.9	0	0	0	0	0	0

Source: IID Staff, Nov. 18, 2019 (Jose Moreno), July, 14, 2020, (Justina Arce)

The proposed Project has an estimated total water demand of 437.14 AF or 14.57 AFY amortized over a 30-year term (for all delivery gate for Project). Thus, the proposed Project demand is a 2,973% <sup>30</sup>increase from the .49 AFY from the historical 10-year average annual delivery for agricultural uses at the proposed Project site. The proposed Project's estimated water demand represents only .06 percent (.06%) of the 23,800 AYF balance of supply available for contracting under the IWSP.

<sup>30</sup> 2,973% % increase is not usually seen. The historic water use over 10 years average at .49 and the amortized annual increase of 14.57 AFY is the reason for the unusual increase. As the project age this number will begin to normalize to a more realistic number.

### 13 IID’S ABILITY TO MEET DEMANDS WITH WATER SUPPLY

Non-agricultural water demands for the IID water service area are projected for 2020-2055 in **Table 8**, and IID agricultural demands including system operation are projected for 2020-2055 in **Table 9**, all volumes within the IID water service area. IID water supplies available for consumptive use after accounting for mandatory transfers are projected to 2077 in **Table 14 (Column 11)**, volumes at Imperial Dam.

To assess IID’s ability to meet future water demands, IID historic and forecasted demands are compared with CRWDA Exhibit B net availability, volumes at Imperial Dam **Table 14 (Column 11)**. The analysis requires accounting for system operation consumptive use within the IID water service area, from AAC at Mesa Lateral 5 to Imperial Dam, and for water pumped for use by the USBR Lower Colorado Water Supply Project (LCRWSP), an IID consumptive use component in the USBR Decree Accounting Report. IID system operation consumptive use for 2019 is provided in Table 19 to show the components included in the calculation and their 2019 volumes.

**Table 19: IID System Operations Consumptive Use within IID Water Service Area and from AAC at Mesa Lateral 5 to Imperial Dam, (KAF), 2019**

QSA Salton Sea Mitigation Delivery terminates on 12/31/2017

Underrun/Overrun = IID CU at Imperial Dam minus CRWDA Exhibit B Net Available

Notes: Ag Delivery for 2020-2055 does not take into account land conversion for solar use nor reduction in agricultural land area due to urban expansion.

As shown above, IID forecasted demand has the potential to exceed CRWDA Exhibit B Net Consumptive Use volumes during several time intervals through the lifespan projection for the Project. However, due to temporary land conversion throughout Imperial County for solar use and urban land expansion that will reduce agricultural acres in the future, a water savings of approximately 217,000 AFY will be generated into the future and for the lifetime of the Project.

In addition, USBR 2019 Decree Accounting Report states that IID Consumptive Use is 2,558.1 KAF (excludes 46,555 AF for water transfer associated with Salton Sea mitigation and 1,579 AF of ICS for storage in Lake Mead) with an underrun of -34.2 KAF, as reported by IID in 2019 Annual SWRCB Report per WRO 2002-2013; that is, IID uses less than the amount in its approved Water Order (2,629,675 AF).

**Table 21: 2019 Approved Water Order, Actual CU (Decree Accounting Report) and IID Underrun, KAF at Imperial Dam**

IID Approved Water Order	2,639.7 less 10 supplied by LCRWSP
IID Consumptive Use	2,558.1
<b>IID Underrun /Overrun</b>	<b>-34,215</b>
Sources: 2019 IID Revised Water Order, approved on March 10, 2020, <u>2019 Decree Accounting Report</u> , and <u>2019 Annual Report of IID Pursuant to SWRCB Revised Order WRO 2002-2013</u>	

As reported in the [2017-2018 IID QSA Implementation Report](#) and [2019 SWRCB IID Report](#) and presented in **Table 21** from 2013 to 2017 IID consumptive use (CU) resulted in underruns; i.e., annual CU was less than the district's QSA Entitlement of 3.1 MAFY minus QSA/Transfer Agreements obligations. This would indicate that even though **Table 15** shows IID Overrun/Underrun at Imperial Dam exceeding CRWDA Exhibit B Net Available for CU, for the 30-year life of the proposed Project, IID consumptive use may be less than forecasted. However, with repeal of the IID EDP in February 2018, it is uncertain whether underruns will continue.

Meanwhile, forecasted Ag Delivery reductions presented in **Table 9** are premised on implementation of on-farm practices that will result in efficiency conservation. These reductions do not take into account land conversion for solar projects nor reduction in agricultural land area due to urban expansion; that is to say, the forecasted Ag Delivery is for acreage in 2003 with reduction for projected on-farm conservation efficiency. Thus, Ag Delivery demand may well be less than forecasted in **Table 9**. In any case, the proposed Project will use less water than the historical agricultural demand of proposed Project site, so the proposed Project will ease rather than exacerbate overall IID water demands.

In the event that IID has issued water supply agreements that exhaust the 25 KAFY IWSP set aside, and it becomes apparent that IID delivery demands due to non-agriculture use are going to cause the district to exceed its quantified 3.1 MAFY entitlement less QSA/Transfer Agreements obligations, IID has identified options to meet these new non-agricultural demands. These options include (1) tracking water yield from temporary land conversion from agricultural to non-agricultural land uses (renewable solar energy); and (2) only if necessary, developing projects to expand the size of the district's water supply portfolio.

These factors will be discussed in the next two sections, **Tracking Water Savings from Growth of Non-Agricultural land Uses and Expanding Water Supply Portfolio**.

### 13.1.1 *Tracking Water Savings from Growth of Non-Agricultural Land Uses*

The Imperial County Board of Supervisors has targeted up to 25,000 acres of agricultural lands, about 5 percent (5%) of the farmable acreage served by IID, for temporary conversion to solar farms; because the board found that this level of reduction would not adversely affect agricultural production. As reported for IID's [2019 Temporary Land Conversion Fallowing Program](#) existing solar developments at the end of 2019 have converted 10,146 acres of farmland. These projects had a yield at-river of 65,791 AF of water in 2019. The balance of the 25,000-acre agriculture-to-solar policy is 14,854 acres. On average, each agricultural acre converted reduces agricultural demand by 5.1 AFY, which results in a total at-river yield (reduction in consumptive use) of 127,500 AFY.

However, due to the nature of the conditional use permits under which solar farms are developed, IID cannot rely on this supply being permanently available. In fact, should a solar project decommission early, that land may go immediately back to agricultural use (it remains zoned an agricultural land). Nevertheless, during their operation, the solar farms do ameliorate pressure on IID to implement projects to meet demand from new non-agricultural projects.

Unlike the impact of solar projects, other non-agricultural uses are projected to grow, as reflected in the nearly 76 percent (76%) increase in non-agricultural water demand from 107.2 KAF in 2015 to 198.4 KAF in 2055 reflected herein in **Table 8**. This increase in demand of 91.2 KAFY will more than likely be met by solar development; however, as the land remains zoned as agricultural land, that source is not reliable to be permanently available to IID.

The amount of land developed for residential, commercial, and industrial purposes is projected to grow by 55,733 acres from 2015 to 2050<sup>31</sup> within the sphere of influence of the incorporated cities and specific plan areas in Imperial County. A conservative estimate is that such development will displace at least another 24,500 acres of farmland based on the Imperial Local Agency Formation Commission (LAFCO) sphere of influence maps and existing zoning and land use in Imperial County. At 5.13 AFY yield at-river, there would be a 125,000 AFY reduction IID net consumptive use.

---

<sup>31</sup> IRWMP, Chapter 5, Table 5-14.

The total foreseeable solar project temporary yield at-river (91,800 AFY) and municipal development permanent yield at-river (125,000 AFY) is to reduce forecasted IID net consumptive use at-river 216,800 AFY, which is more than enough to meet the forecast Demand minus Exhibit B Net Available volumes shown in [Table 14](#). This Yield at-river is sufficient to meet the forecasted excess of non-agricultural use over Net Available supply within the IID service area for the next 20 years, as is required for SB 610 analysis.

Farmland retirement associated with municipal development would reduce IID agricultural delivery requirements beyond the efficiency conservation projections shown in **Table 9**. Therefore, in the event that [Schedule 7 General Industrial Use](#) water is unavailable, the Applicants will rely on IID IWSP water to supply the Project, as discussed above in the section **IID Water Supply Policy for Non-Agricultural Projects** (September 2009).

## 13.2 EXPANDING WATER SUPPLY PORTFOLIO

While forecasted long-term annual yield-at-river from the reduction in agricultural acreage due to municipal development in the IID service area is sufficient to meet the forecasted excess of non-agricultural use over CRWDA Net Available supply, **Table 14**, without expanding IID's Water Supply Portfolio, IID has also evaluated the feasibility of a number of capital projects to increase its water supply portfolio.

As reported in [2012 Imperial IRWMP Chapter 12](#), IID contracted with GEI Consultants, Inc. to identify a range of capital project alternatives that the District could implement. Qualitative and quantitative screening criteria and assumptions were developed in consultation with IID staff. Locations within the IID water service area with physical, geographical, and environmental characteristics most suited to implementing short- and long-term alternatives were identified. Technical project evaluation criteria included volumes of water that could be delivered and/or stored by each project, regulatory and permitting complexity, preliminary engineering components, land use requirements, and costs.

After preliminary evaluation, a total of 27 projects were configured:

- 17 groundwater or drain water desalination
- 2 groundwater blending
- 6 recycled water
- 1 groundwater banking
- 1 IID system conservation (concrete lining)

Projects were assessed at a reconnaissance level to allow for comparison of project costs. IID staff and the board identified key factors to categorize project alternatives and establish priorities. Lower priority projects were less feasible due to technical, political, or financial constraints. Preferential criteria were features that increased the relative benefits of a project and grant it a higher priority. Four criteria were used to prioritize the IID capital projects:

1. **Financial Feasibility.** Projects whose unit cost was more than \$600/AF were eliminated from further consideration.
2. **Annual Yield.** Project alternatives generating 5,000 AF or less of total annual yield were determined not to be cost-effective and lacking necessary economies of scale.
3. **Groundwater Banking.** Groundwater banking to capture and store underruns is recognized as a beneficial use of Colorado River water. Project alternatives without groundwater banking were given a lower priority.
4. **Partnering.** Project alternatives in which IID was dependent on others (private and/or public agencies) for implementation were considered to have a lower priority in the IID review; this criterion was reserved for the IRWMP process, where partnering is a desirable attribute.

Based on these criteria, the top ten included six desalination, two groundwater blending, one system conservation, and one groundwater storage capital projects. These capital projects are listed **Table 22** which follows.

*Table 22: IID Capital Project Alternatives and Cost (May 2009 price levels \$)*

Name	Description	Capital Cost	O&M Cost	Equivalent Annual Cost	Unit Cost (\$/AF)	In-Valley Yield (AF)
<b>GW 18</b>	Groundwater Blending E. Mesa Well Field Pumping to AAC	\$39,501,517	\$198,000	\$2,482,000	\$99	25,000

### 13.3 IID NEAR TERM WATER SUPPLY PROJECTIONS

As mentioned above, IID’s quantified Priority 3(a) water right under the QSA/Transfer Agreements secures 3.1 MAF per year, less transfer obligations of water for IID’s use from the Colorado River, without relying on rainfall in the IID service area. Even with this strong entitlement to water, IID actively promotes on-farm efficiency conservation and is implementing system efficiency conservation measures including seepage recovery from IID canals and the All-American Canal (ACC) and measures to reduce operational discharge. As the IID website [Water Department](#) states:

Through the implementation of extraordinary conservation projects, the development of innovative efficiency measures and the utilization of progressive management tools, the IID Water Department is working to ensure both the long-term viability of agriculture and the continued protection of water resources within its service area.

Overall, agricultural water demand in the Imperial Valley will decrease due to IID system and grower on-farm efficiency conservation measures that are designed to maintain agricultural productivity at pre-QSA levels while producing sufficient yield-at-river to meet IID’s QSA/Transfer Agreements obligations. These efficiencies combined with the conversion of some agricultural land uses to non-agricultural land uses (both solar and municipal), ensure that IID can continue to meet the water delivery demand of its existing and

future agricultural and non-agricultural water users, including this Project for the next 30 years and for the life of the proposed Project.

## 14 PUBLIC WATER SYSTEM/ LEAD AGENCY FINDINGS

---

IID serves as the regional wholesale water supplier, importing raw Colorado River water and delivering it, untreated, to agricultural, municipal, industrial, environmental, and recreational water users within its Imperial Unit water service area. The County of Imperial serves as the responsible agency with land use authority over the proposed project. Water Assessment findings are summarized as follows:

1. IID's annual entitlement to consumptive use of Colorado River water is capped at 3.1 MAF less water transfer obligations, pursuant to the QSA and Related Agreements. Under the terms of the CRWDA, IID is implementing efficiency conservation measure to reduce net consumptive use of Colorado River water needed to meet its QSA/Transfer Agreements obligations while retaining historical levels of agricultural productivity.
2. In 2019 IID consumptively used 2,588,136 AF of Colorado River water (volume at Imperial Dam); 2,315,988 AF were delivered to customers of which 2,225,089 AF or 96 percent went to agricultural users.
3. Reduction of IID's net consumptive use of Colorado River water under the terms of the Colorado River Water Delivery Agreement is to be the result of efficiency conservation measures. Agricultural consumptive use in the Imperial Valley will not decline. However, IID operational spill and tailwater will decline, impacting the Salton Sea.
4. Due to the dependability of IID's water rights, Colorado River flows, and Colorado River storage facilities for Colorado River water, it is unlikely that the water supply of IID would be disrupted, even in dry years or under shortage conditions because Mexico, Arizona and Nevada have lower priority and are responsible for reducing their water use during a declared Colorado River water shortage before impacting California.
5. Historically, IID has never been denied the right to use the annual volume of water it has available for its consumptive uses under its entitlement. Nevertheless, IID is participating in discussions for possible actions in response to extreme drought on the Colorado River.
6. The proposed Project has an estimated total water demand of 437.14 AF or 14.57 AFY amortized over a 30-year term (for the delivery gate for Project). Thus, the proposed Project demand is a

2,973% (increase) of 14.57 AFY from the historical 10-year average of .49 percent of the historic 10-year average annual delivery for agricultural uses at the proposed Project site.

7. The Project's water use will be covered under the [Schedule 7 General Industrial Use](#). In the event that IID determines that the proposed Project is to utilize IWSP for Non-Agricultural Projects water, the Applicant will enter into an IWSP Water Supply Agreement with IID. In which case, the proposed Project would use .06 percent (.06%) of the 23,800 AYF of IWSP water. Which would leave a remaining amount of 23,785.43 AFY.
8. Based on the Environmental Impact Report (EIR) prepared for this proposed Project pursuant to the CEQA, California Public Resources Code sections 21000, *et seq.*, the Lead Agency hereby finds that the IID projected water supply will be sufficient to satisfy the demands of this proposed Project in addition to existing and planned future uses, including agricultural and non-agricultural uses for a 20-year Water Supply Assessment period and for the 30 -year proposed Project life. California State Clearing House Number: 2020040122, Westside Main Canal Battery Storage Project.

## 15 ASSESSMENT CONCLUSION

---

This Water Supply Assessment has determined that IID water supply is adequate for the proposed Project. The Imperial Irrigation District's IWSP for Non-Agricultural Projects dedicates 25,000 AF of IID's annual water supply to serve new projects. As of June 2020, 23,800 AF per year remain available for new projects ensuring reasonably sufficient supplies for new non-agricultural water users. The Project water demand of approximately 437.14 AF and 14.57 AFY amortized represents .06 % of the unallocated supply set aside in the IWSP for non-agricultural project, and approximately .06 percent (.06 %) of forecasted future non-agricultural water demands planned in the Imperial IRWMP through 2055. The water demand for the proposed Project at full build-out represents a 2,973% increase from the 10-year historic average agricultural water use for 2010-2019 at the proposed Project site.

For all the reasons described herein, the amount of water available and the stability of the IID water supply along with on-farm and system efficiency conservation and other measures being undertaken by IID and its customers ensure that the proposed Project's water needs will be met for the next 30 years as assessed for compliance under SB-610.

Attachment B: Colorado Water Delivery Agreement

(This page intentionally left blank)

## 17 Attachment A: IID Interim Water Supply Policy for Non-Agricultural Projects<sup>32</sup>

---

### 1.0 Purpose.

Imperial Irrigation District (the District) is developing an Integrated Water Resources Management Plan (IWRMP)<sup>33</sup> that will identify and recommend potential programs and projects to develop new water supplies and new storage, enhance the reliability of existing supplies, and provide more flexibility for District water department operations, all in order to maintain service levels within the District's existing water service area. The first phase of the IWRMP is scheduled to be completed by the end of 2009 and will identify potential projects, implementation strategies and funding sources. Pending development of the IWRMP, the District is adopting this Interim Water Supply Policy (IWSP) for Non-Agricultural Projects, as defined below, in order to address proposed projects that will rely upon a water supply from the District during the time that the IWRMP is still under development. It is anticipated that this IWSP will be modified and/or superseded to take into consideration policies and data developed by the IWRMP.

### 2.0 Background.

The IWRMP will enable the District to more effectively manage existing water supplies and to maximize the District's ability to store or create water when the available water supplies exceed the demand for such water. The stored water can be made available for later use when there is a higher water demand. Based upon known pending requests to the District for water supply assessments/verifications and pending applications to the County of Imperial for various Non-Agricultural Projects, the District currently estimates that up to 50,000 acre feet per year (AFY) of water could potentially be requested for Non-Agricultural Projects over the next ten to twenty years. Under the IWRMP the District shall evaluate the projected water demand of such projects and the potential means of supplying that amount of water. This IWSP currently designates up to 25,000 AFY of water for potential Non-Agricultural Projects within IID's water service area. Proposed Non-Agricultural projects may be required to pay a Reservation Fee, further described below. The reserved water shall be available for other users until such Non-Agricultural projects are implemented and require the reserved water supply. This IWSP shall remain in effect pending the approval of further policies that will be adopted in association with the IWRMP.

---

<sup>32</sup> IID Board Resolution 31-2009. Interim Water Supply Policy for New Non-Agricultural Projects. September 29, 2009. <[IID Interim Water Supply Policy for Non-Agricultural Projects](#)>

<sup>33</sup> The 2009 Draft IID IWRMP has been superseded by the October 2012 Imperial IRWMP, which incorporates the conditions of the IWSP by reference.

### **3.0 Terms and Definitions.**

3.1 Agricultural Use. Uses of water for irrigation, crop production and leaching.

3.2 Connection Fee. A fee established by the District to physically connect a new Water User to the District water system.

3.3 Industrial Use. Uses of water that are not Agricultural or Municipal, as defined herein, such as manufacturing, mining, cooling water supply, energy generation, hydraulic conveyance, gravel washing, fire protection, oil well re-pressurization and industrial process water.

3.4 Municipal Use. Uses of water for commercial, institutional, community, military, or public water systems, whether in municipalities or in unincorporated areas of Imperial County.

3.5 Mixed Use. Uses of water that involve a combination of Municipal Use and Industrial Use.

3.6 Non-Agricultural Project. Any project which has a water use other than Agricultural Use, as defined herein.

3.7 Processing Fee. A fee charged by the District Water Department to reimburse the District for staff time required to process a request for water supply for a Non-Agricultural Project.

3.8 Reservation Fee. A non-refundable fee charged by the District when an application for water supply for a Non-Agricultural Project is deemed complete and approved. This fee is intended to offset the cost of setting aside the projected water supply for the project during the period commencing from the completion of the application to start-up of construction of the proposed project and/or execution of a water supply agreement. The initial payment of the Reservation Fee will reserve the projected water supply for up to two years. The Reservations Fee is renewable for up to two additional two-year periods upon payment of an additional fee for each renewal.

3.9 Water Supply Development Fee. An annual fee charged to some Non-Agricultural Projects by the District, as further described in Section 5.2 herein. Such fees shall assist in funding IWRMP or related water supply projects,

3.10 Water User. A person or entity that orders or receives water service from the District.

### **4.0. CEQA Compliance.**

4.1 The responsibility for CEQA compliance for new development projects within the unincorporated area of the County of Imperial attaches to the County of Imperial or, if the project is within the boundaries of a municipality, the particular municipality, or if the project is subject to the jurisdiction of another agency, such as the California Energy Commission, the particular agency. The District will coordinate with the

County of Imperial, relevant municipality, or other agency to help ensure that the water supply component of their respective general plans is comprehensive and based upon current information. Among other things, the general plans should assess the direct, indirect and cumulative potential impacts on the environment of using currently available water supplies for new industrial, municipal, commercial and/or institutional uses instead of the historical use of that water for agriculture. Such a change in land use, and the associated water use, could potentially impact land uses, various aquatic and terrestrial species, water quality, air quality and the conditions of drains, rivers and the Salton Sea.

4.2 When determining whether to approve a water supply agreement for any Non-Agricultural Project pursuant to this IWSP, the District will consider whether potential environmental and water supply impacts of such proposed projects have been adequately assessed, appropriate mitigation has been developed and appropriate conditions have been adopted by the relevant land use permitting/approving agencies, before the District approves any water supply agreement for such project.

#### **5.0. Applicability of Fees for Non-Agricultural Projects.<sup>34</sup>**

5.1 Pursuant to this Interim Water Supply Policy, applicants for water supply for a Non-Agricultural Project shall be required to pay a Processing Fee and may be required to pay a Reservation Fee as shown in Table A. All Water Users shall also pay the applicable Connection Fee, if necessary, and regular water service fees according to the District water rate schedules, as modified from time to time.

5.2 A Non-Agricultural Project may also be subject to an annual Water Supply Development Fee, depending upon the nature, complexity, and water demands of the proposed project. The District will determine whether a proposed Non-Agricultural Project is subject to the Water Supply Development Fee for water supplied pursuant to this IWSP as follows:

5.2.1. A proposed project that will require water for a Municipal Use shall be subject to an annual Water Supply Development Fee as set forth in Table B if the projected water demand for the project is in excess of the project's estimated population multiplied by the District-wide per capita usage. Municipal Use projects without an appreciable residential component will be analyzed under sub-section 5.2.3.

5.2.2. A proposed project that will require water for an Industrial Use located in an unincorporated area of the County of Imperial shall be subject to an annual Water Supply Development Fee as set forth in Table B.

5.2.3. The applicability of the Water Supply Development Fee set forth in Table B to Mixed Use projects, Industrial Use projects located within a municipality, or Municipal Use projects without an appreciable residential component, will be determined by the District on a case-by-case basis, depending upon the proportion of types of land uses and the water demand proposed for the project.

---

<sup>34</sup> The most recent fee schedules can be found in a link at IID/Water/ Municipal, Industrial and Commercial Customers; or visit by URL at [Imperial Irrigation District : Water Rate Schedules](#)

5.3. A proposed Water User for a Non-Agricultural Projects may elect to provide some or all of the required water supply by paying for and implementing some other means of providing water in a manner approved by the District, such as conservation projects, water storage projects and/or use of an alternative source of supply, such as recycled water or some source of water other than from the District water supply. Such election shall require consultation with the District regarding the details of such alternatives and a determination by the District, in its reasonable discretion, concerning how much credit, if any, should be given for such alternative water supply as against the project's water demand for purposes of determining the annual Water Supply Development Fee for such project.

5.4 The District Board shall have the right to modify the fees shown on Tables A and B from time to time.

6. Water Supply Development Fees collected by the District under this IWSP shall be accounted for independently, including reasonable accrued interest, and such fees shall only be used to help fund IWRMP or related District water supply projects.

7. Any request for water service for a proposed Non-Agricultural Project that meets the criteria for a water supply assessment pursuant to Water Code Sections 10910-10915 or a water supply verification pursuant to Government Code Section 66473.7 shall include all information required by Water Code Sections 10910 –10915 or Government Code Section 66473.7 to enable the District to prepare the water supply assessment or verification. All submittals should include sufficient detail and analysis regarding the project's water demands, including types of land use and per capita water usage, necessary to make the determinations outlined in Section 5.2.

8. Any request for water service for a proposed Non-Agricultural Project that does not meet the criteria for a water supply assessment pursuant to Water Code Section 10910-10915 or water supply verification pursuant to Government Code Section 66473.7 shall include a complete project description with a detailed map or diagram depicting the footprint of the proposed project, the size of the footprint, projected water demand at full implementation of the project and a schedule for implementing water service. All submittals should include sufficient detail and analysis regarding the project's water demands, including types of land use and per capita water usage, necessary to make the determinations outlined in Section 5.2.

9. All other District rules and policies regarding a project applicant or Water User's responsibility for paying connection fees, costs of capital improvements and reimbursing the District for costs of staff and consultant's time, engineering studies and administrative overhead required to process and implement projects remain in effect.

10. Municipal Use customers shall be required to follow appropriate water use efficiency best management practices (BMPs), including, but not limited to those established by the California Urban Water Conservation Council BMP's (see <http://www.cuwcc.org/mou/exhibit-1-bmp-definitions-schedules->

[requirements.aspx](#)), or other water use efficiency standards, adopted by the District or local government agencies.

11. Industrial Use customers shall be required to follow appropriate water use efficiency BMP's, including but not limited to those established by the California Urban Water Conservation Council and California Energy Commission, as well as other water use efficiency standards, adopted by the District or local government agencies.

12. The District may prescribe additional or different BMPs for certain categories of Municipal and Industrial Water Users.

TRANSPORTATION IMPACT ANALYSIS  
**WESTSIDE CANAL BATTERY STORAGE COMPLEX PROJECT**  
Imperial County, California  
July 22, 2019

## 1.0 INTRODUCTION

Linscott, Law & Greenspan Engineers (LLG) has been retained to assess the traffic impacts associated with the proposed Westside Canal Battery Storage Complex Project (Project). Development of the project will provide a utility-scale energy storage complex incorporating lithium ion battery systems and/or flow battery technologies throughout the site.

Included in this traffic report are the following.

- Project Description
- Existing Conditions Discussion
- Analysis Approach and Methodology
- Significance Criteria
- Existing Conditions Analysis
- Near-Term without Project Analysis
- Trip Generation/Distribution/Assignment
- Near-Term with Project Analysis
- Summary and Conclusions

## 2.0 PROJECT LOCATION AND DESCRIPTION

### 2.1 Project Location

The project will be located in the unincorporated Mount Signal area of the County, approximately 8.0 miles southwest of the city of El Centro and approximately 5.3 miles north of the U.S.-Mexico border. The project site is comprised of two parcels, Assessor Parcel Number (APN) 051-350-010 and APN 051-350-011, totaling approximately 148 acres. This land has limited access corridors for vehicular traffic and is less desirable for agricultural production, as reflected by the last 15 years without farming activity.

The project site is approximately one-third mile north of the Imperial Valley Substation (IV Substation) and directly south of the intersection of Liebert Road and the Imperial Irrigation District's (IID) Westside Main Canal. The project site is bounded by the Westside Main Canal to the north, Bureau of Land Management (BLM) lands to the south and west, and vacant private land to the east. The Campo Verde solar generation facility is located north of the project site, across the Westside Main Canal.

The two project parcels will be developed as the utility-scale energy storage complex. The project will also utilize portions of two parcels located north of the Westside Main Canal (APN 051-350-019 owned by IID and APN 051-350-018 owned by a private land owner) for site access and as a temporary construction staging area. The project will also access a small portion of APN 051-350-009 within an IID easement for connection to the existing IID Campo Verde Imperial Valley 230 kilovolt radial gen-tie line during the construction of a substation on the project site. The total proposed project development footprint, encompassing both temporary and permanent impacts, will be 163.32 acres.

*Figure 2-1* shows the Project location.

### 2.2 Project Description

Development of the project will provide a utility-scale energy storage complex incorporating lithium ion battery systems and/or flow battery technologies throughout the site. The project will allow excess, intermittent renewable energy to be stored and later dispatched optimally back into the grid as firm, reliable generation when needed. The project complements solar and wind projects currently operating, and planned for development, in Imperial County (County), and supports the broader southern California bulk electric system by serving as a transmission asset.

The project is expected to be constructed in multiple phases, over multiple years, with each phase ranging from approximately 25 megawatts (MW) up to 350 MW per phase. Construction of the first phase includes roads, bridge and common facilities, and the first battery storage facility and is anticipated to begin in 2021 with completion expected in 2022. The project will store energy for up to a 12-hour duration based on grid and market conditions. The total nameplate capacity of the project at full build-out is approximately 2,025 MW.

On-site photovoltaic (PV) solar generation will serve as station auxiliary power and be deployed throughout the project site as rooftop solar on buildings, as well as ground-mounted solar, constructed during each phase. The timing and energy storage capacity of the project's phases will be dependent on commercial contracts for the energy/capacity to be stored/discharged in response to the need for energy storage to manage renewable energy growth throughout the greater southern California area. This energy storage complex would thus become a valuable tool for commercial customer(s) and system operators to better manage intermittent renewable generation by converting it into reliable, dispatchable generation. The date for project build-out is currently not known and would be dependent on the factors listed above.

The project is pursuing the following objectives:

- To allow for the storage of power/renewable power to help meet the state energy needs.
- To be able to receive renewable generated electricity during times of excess generation or times of less desirable generation and store that power for release when the customer (i.e., a load-serving entity) deems it to be more valuable.
- To be a valuable tool in allowing the customer and system operators to manage and convert intermittent renewable generation into reliable, dispatchable generation.
- To build on available land that is a less desirable location for agricultural production due to 15-plus years of agricultural inactivity, but also due to limited access corridors for vehicular traffic to the remote property.

The project is surrounded by private land owners to the east, BLM land to the south and west, and IID maintenance roads and Westside Main Canal to the north. Due to the site having no direct vehicular access routes, the applicant is proposing to construct roads on both the north and south sides of the Westside Main Canal on private land, and a bridge over the Westside Main Canal. The project proposes a new clear-span Imperial County/California Department of Transportation (Caltrans) specified bridge to span the Westside Main Canal which would connect to a proposed access road easement on the north side of the Westside Main Canal. The north side proposed access road would ultimately connect the project to county road (CR) Liebert Road. The project also would dedicate to the County 60 feet of frontage along the north project fence line and south of the IID Westside Main Canal operation and maintenance road to be used for a south side proposed access road to the site and also for the public (principally the neighboring private landowners).

The major traffic effects of project development will occur during construction. The project may require up to 200 employees per day during the peak construction period. Construction activities would occur during daytime hours (up to eight hours per day).

Operation of the project would require routine maintenance and security. It is anticipated that the project would employ a plant manager and an operations and maintenance manager, as well as the addition of a facility manager once the complex deploys 500 MW of generation. The complex will

also employ staff technicians, with at least one additional technician for every approximately 250 MW of generation. It is estimated that the impacts of this operational traffic will be very small (up to 20 employees). As such, the focus of this transportation impact analysis will be on the peak construction period.

### 3.0 EXISTING CONDITIONS

The intersections and roadway segments included in the study area are listed below. These locations were chosen since they will carry the majority of Project traffic. The study area includes locations within the jurisdictions of Caltrans and Imperial County.

#### Intersections

1. I-8 WB Ramps / Drew Road (*Caltrans*)
2. I-8 EB Ramps / Drew Road (*Caltrans*)
3. Drew Road / Wixom Road (*Imperial County*)

#### Street Segments

- a. Drew Road: I-8 to Wixom Road (*Imperial County*)
- b. Wixom Road: Liebert Road to Drew Road (*Imperial County*)

### 3.1 Existing Transportation Conditions

The following is a description of the nearby roadway network:

**Drew Road** is classified as a Collector in the Imperial County Circulation Element Plan. It is currently constructed as a two-lane roadway in the study area. The posted speed limit is 55 mph. There are no bike lanes provided.

**Wixom Road** is an unclassified roadway in the Imperial County Circulation Element Plan. It is currently constructed as a two-lane roadway in the study area. There is no posted speed limit. There are no bike lanes provided.

**Figure 3-1** depicts the existing traffic conditions of the study area intersections and street segments graphically.

### 3.2 Existing Traffic Volumes

Weekday AM/PM peak hour intersection turning movement and bi-directional daily traffic counts were conducted in March 2019. The peak hour counts were conducted between the hours of 7:00-9:00 AM and 4:00-6:00 PM. Minor adjustments were made to manually balance peak hour volumes between the freeway ramp intersections.

Daily street segment (ADT) counts were conducted in March 2019 and are shown on **Table 3-1**.

**Appendix A** contains the manual count sheets.

TABLE 3-1  
EXISTING STREET SEGMENT TRAFFIC VOLUMES

Street Segment	ADT <sup>a</sup>	Date	Source
<b>Drew Road</b> I-8 to Wixom Road	541	2019	LLG Engineers
<b>Wixom Road</b> Liebert Road to Drew Road	89	2019	LLG Engineers

**Footnotes:**

- a. ADT = Average Daily Traffic volumes.

**Figure 3-2** depicts the peak hour intersection turning movement and street segment volumes on study area facilities.

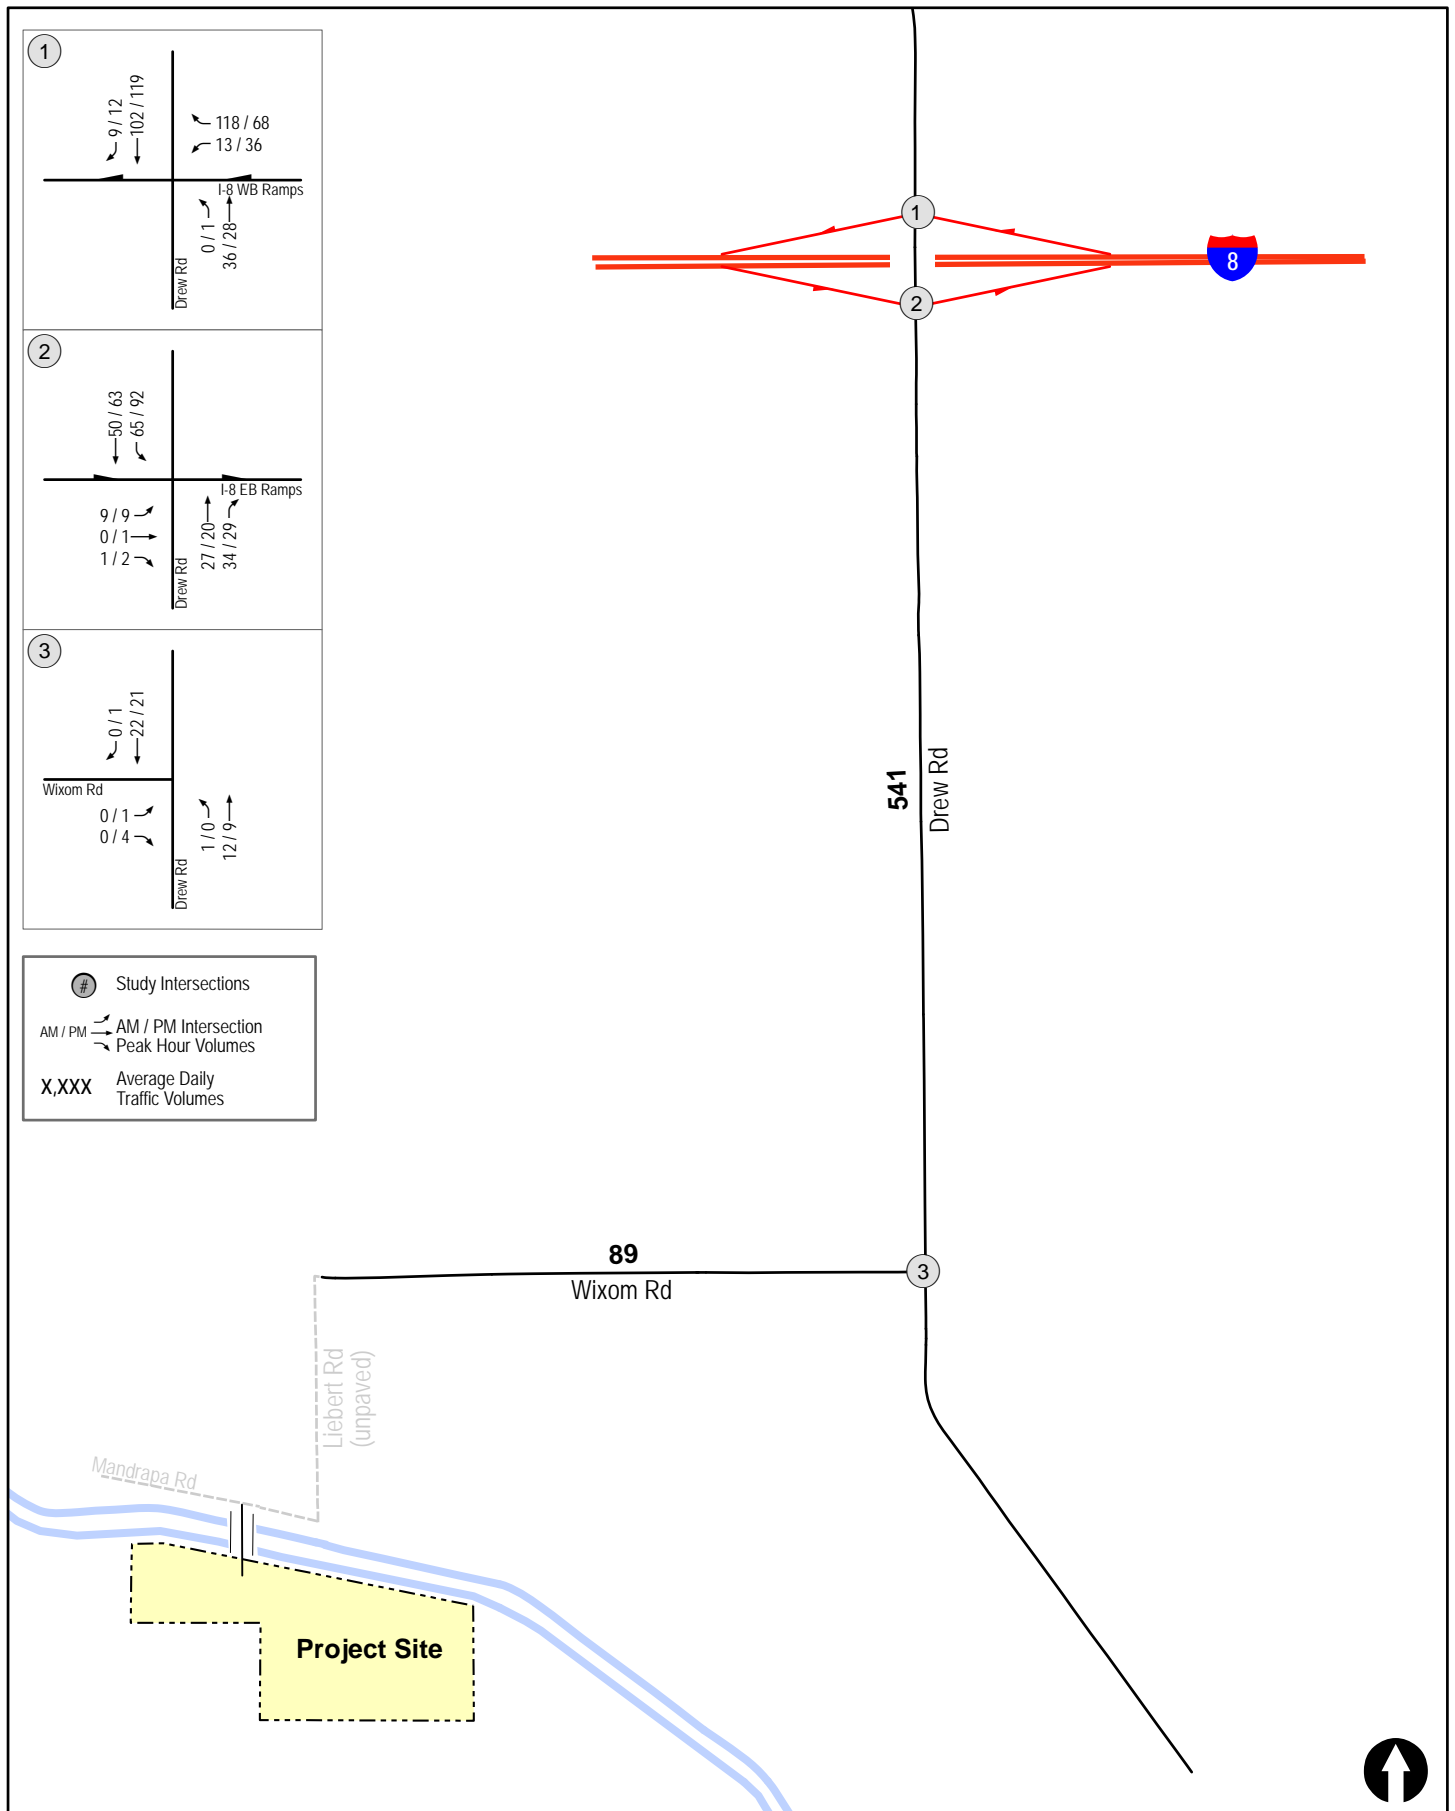

Figure 3-2

## Existing Traffic Volumes

WESTSIDE CANAL BATTERY STORAGE COMPLEX PROJECT

PC ORIGINAL PKG

## 4.0 ANALYSIS APPROACH AND METHODOLOGY

Level of service (LOS) is the term used to denote the different operating conditions which occur on a given roadway segment under various traffic volume loads. It is a qualitative measure used to describe a quantitative analysis taking into account factors such as roadway geometries, signal phasing, speed, travel delay, freedom to maneuver, and safety. Level of service provides an index to the operational qualities of a roadway segment or an intersection. Level of service designations range from A to F, with LOS A representing the best operating conditions and LOS F representing the worst operating conditions. Level of service designation is reported differently for intersections and roadway segments.

### 4.1 Intersections

All study area intersections are unsignalized. *Unsignalized intersections* were analyzed under AM and PM peak hour conditions. Average vehicle delay and Levels of Service (LOS) were determined based upon the procedures found in Chapter 20 and Chapter 21 of the *HCM 6* with the assistance of the *Synchro 10* computer software. A more detailed explanation of the methodology are attached in *Appendix B*.

### 4.2 Street Segments

Street segment analysis is based upon the comparison of daily traffic volumes (ADTs) to Imperial County's *Standard Street Classification Table*. This table provides segment capacities for different street classifications, based on traffic volumes and roadway characteristics. Imperial County's *Standard Street Classification Table* is attached in *Appendix C*.

## 5.0 SIGNIFICANCE CRITERIA

Street segments and intersections are located in both the County of Imperial's and Caltrans' jurisdictions. Therefore, the applicable significance criteria for each was utilized.

### 5.1 County of Imperial

The County of Imperial does not have published significance criteria. However, the County General Plan does state that the LOS goal for intersections and roadway segments is to operate at LOS C or better. Therefore, if an intersection or segment degrades from LOS C or better to LOS D or worse with the addition of Project traffic, the impact is considered significant. If the location operates at LOS D or worse with and without Project traffic, the impact is considered significant if the Project causes the intersection delta to increase by more than two (2) seconds, or the segment volume to capacity (V/C) ratio to increase by more than 0.02.

### 5.2 Caltrans

A project is considered to have a significant impact if the new project traffic decreases the operations of surrounding roadways by a defined threshold. The defined thresholds for roadway segments and intersections are defined in *Table 5-1* for this rural area. If the project exceeds the thresholds in *Table 5-1*, then the project may be considered to have a significant project impact. A feasible mitigation measure will need to be identified to return the impact within the thresholds (pre-project + allowable increase) or the impact will be considered significant and unmitigated.

**TABLE 5-1**  
**TRAFFIC IMPACT SIGNIFICANT THRESHOLDS**

Level of Service with Project <sup>a</sup>	Allowable Increase Due to Project Impacts <sup>b</sup>					
	Freeways		Roadway Segments		Intersections	Ramp Metering
	V/C	Speed (mph)	V/C	Speed (mph)	Delay (sec.)	Delay (min.)
D, E & F (or ramp meter delays above 15 minutes)	0.01	1	0.02	1	2	2 <sup>c</sup>

**Footnotes:**

- a. All level of service measurements are based upon HCM procedures for peak-hour conditions. However, V/C ratios for Roadway Segments may be estimated on an ADT/24-hour traffic volume basis (using Table 4-3 or a similar LOS chart for each jurisdiction). The acceptable LOS for freeways, roadways, and intersections is generally "D" ("C" for undeveloped or not densely developed locations per jurisdiction definitions). For metered freeway ramps, LOS does not apply. However, ramp meter delays above 15 minutes are considered excessive.
- b. If a proposed project's traffic causes the values shown in the table to be exceeded, the impacts are deemed to be significant. These impact changes may be measured from appropriate computer programs or expanded manual spreadsheets. The project applicant shall then identify feasible mitigations (within the Traffic Impact Study [TIS] report) that will maintain the traffic facility at an acceptable LOS. If the LOS with the proposed project becomes unacceptable (see note a above), or if the project adds a significant amount of peak hour trips to cause any traffic queues to exceed on- or off-ramp storage capacities, the project applicant shall be responsible for mitigating significant impact changes.
- c. The allowable increase in delay at a ramp meter with more than 15 minutes of delay and freeway LOS E is 2 minutes and at LOS F is 1 minute.

**General Notes:**

1. V/C = Volume to Capacity Ratio.
2. Speed = Arterial speed measured in miles per hour.
3. Delay = Average stopped delay per vehicle measured in seconds for intersections, or minutes for ramp meters.
4. LOS = Level of Service.

## 6.0 ANALYSIS OF EXISTING CONDITIONS

### 6.1 Peak Hour Intersection Levels of Service

**Table 6-1** summarizes the existing intersections' level of service. As seen in *Table 6-1*, all intersections are calculated to currently operate at LOS A.

**Appendix D** contains the Existing intersection analysis worksheets.

TABLE 6-1  
EXISTING INTERSECTION OPERATIONS

Intersection	Jurisdiction	Control Type	Critical Movement	Peak Hour	Existing	
					Delay <sup>b</sup>	LOS <sup>c</sup>
1. Drew Road / I-8 WB Ramps	Caltrans	MSSC <sup>a</sup>	WB	AM	9.3	A
				PM	9.0	A
2. Drew Road / I-8 EB Ramps	Caltrans	MSSC	EB	AM	10.4	B
				PM	10.5	B
3. Drew Road / Wixom Road	Imperial County	MSSC	EB	AM	0.0	A
				PM	8.5	A

**Footnotes:**

- a. MSSC = Minor Street Stop-Control.
- b. Average delay expressed in seconds per vehicle.
- c. LOS = Level of Service.

UNSIGNALIZED

DELAY/LOS THRESHOLDS

Delay	LOS
0.0 ≤ 10.0	A
10.1 to 15.0	B
15.1 to 25.0	C
25.1 to 35.0	D
35.1 to 50.0	E
≥ 50.1	F

## 6.2 Daily Street Segment Levels of Service

**Table 6–2** summarizes the existing daily street segment level of service. As seen in *Table 6–2*, both roadway segments are calculated to currently operate at LOS A.

TABLE 6–2  
EXISTING STREET SEGMENT OPERATIONS

Street Segment	Classification	Capacity (LOS E) <sup>a</sup>	ADT <sup>b</sup>	LOS <sup>c</sup>
<b>Drew Road</b> I-8 to Wixom	Collector	8,100 <sup>d</sup>	541	A
<b>Wixom Road</b> Liebert Road to Drew Road	None	8,100 <sup>d</sup>	89	A

**Footnotes:**

- a. Capacities based on Imperial County Standard Street Classification table.
- b. ADT = Average Daily Traffic volumes.
- c. LOS = Level of Service.
- d. Both roadway segments are currently built as two-lane roads. Roadway capacities were conservatively assumed as half of the Local Collector capacities from the Imperial County Standard Street Classification table.

## 7.0 NEAR-TERM ANALYSIS

### 7.1 Growth Factor

Using current knowledge of local traffic patterns and engineering judgement, a growth factor of 2% was applied to the existing volumes for two (2) years to account for worst-case traffic volume at the time of construction.

**Figure 7-1** shows the Near-Term without Project volumes based on the 4% growth factor over existing.

### 7.2 Analysis of Near-Term without Project

#### 7.2.1 Peak Hour Intersection Levels of Service

**Table 7-1** summarizes the Near-Term without Project intersections level of service. As seen in *Table 7-1*, all intersections are calculated to operate at acceptable LOS B or better in the near-term.

**Appendix E** contains the Near-Term without Project intersection analysis worksheets.

TABLE 7-1  
NEAR-TERM WITHOUT PROJECT INTERSECTION OPERATIONS

Intersection	Juris.	Control Type	Critical Movement	Peak Hour	Existing		Near-Term without Project	
					Delay <sup>a</sup>	LOS <sup>b</sup>	Delay	LOS
1. Drew Road / I-8 WB Ramps	Caltrans	MSSC <sup>c</sup>	WB	AM	9.3	A	9.4	A
				PM	9.0	A	9.0	A
2. Drew Road / I-8 WB Ramps	Caltrans	MSSC	EB	AM	10.4	B	10.6	B
				PM	10.5	B	10.6	B
3. Drew Road / Wixom Road	Imperial County	MSSC	EB	AM	0.0	A	0.0	A
				PM	8.5	A	8.5	A

**Footnotes:**

- a. Average delay expressed in seconds per vehicle.
- b. LOS = Level of Service.
- c. MSSC = Minor Street Stop-Control.

UNSIGNALIZED

DELAY/LOS THRESHOLDS

Delay	LOS
0.0 ≤ 10.0	A
10.1 to 15.0	B
15.1 to 25.0	C
25.1 to 35.0	D
35.1 to 50.0	E
≥ 50.1	F

### 7.2.2 Daily Street Segment Levels of Service

**Table 7-2** summarizes the Near-Term without Project street segment level of service. As seen in *Table 7-2*, both segments are calculated to operate at LOS A.

**TABLE 7-2  
NEAR-TERM WITHOUT PROJECT STREET SEGMENT OPERATIONS**

Street Segment	Classification	Capacity (LOS E) <sup>a</sup>	Existing			Near-Term without Project		
			ADT <sup>b</sup>	LOS <sup>c</sup>	V/C <sup>d</sup>	ADT	LOS	V/C
<b>Drew Road</b> I-8 to Wixom Road	Collector	8,100 <sup>e</sup>	541	A	0.067	563	A	0.070
<b>Wixom Road</b> Liebert Road to Drew Road	None	8,100 <sup>e</sup>	89	A	0.011	93	A	0.011

**Footnotes:**

- a. Capacities based on Imperial County Standard Street Classification Table.
- b. ADT = Average Daily Traffic Volumes.
- c. LOS = Level of Service.
- d. V/C = Volume to Capacity ratio.
- e. Both roadway segments are currently built as two-lane roads. Roadway capacities were conservatively assumed as half of the Local Collector capacities from the Imperial County Standard Street Classification table.

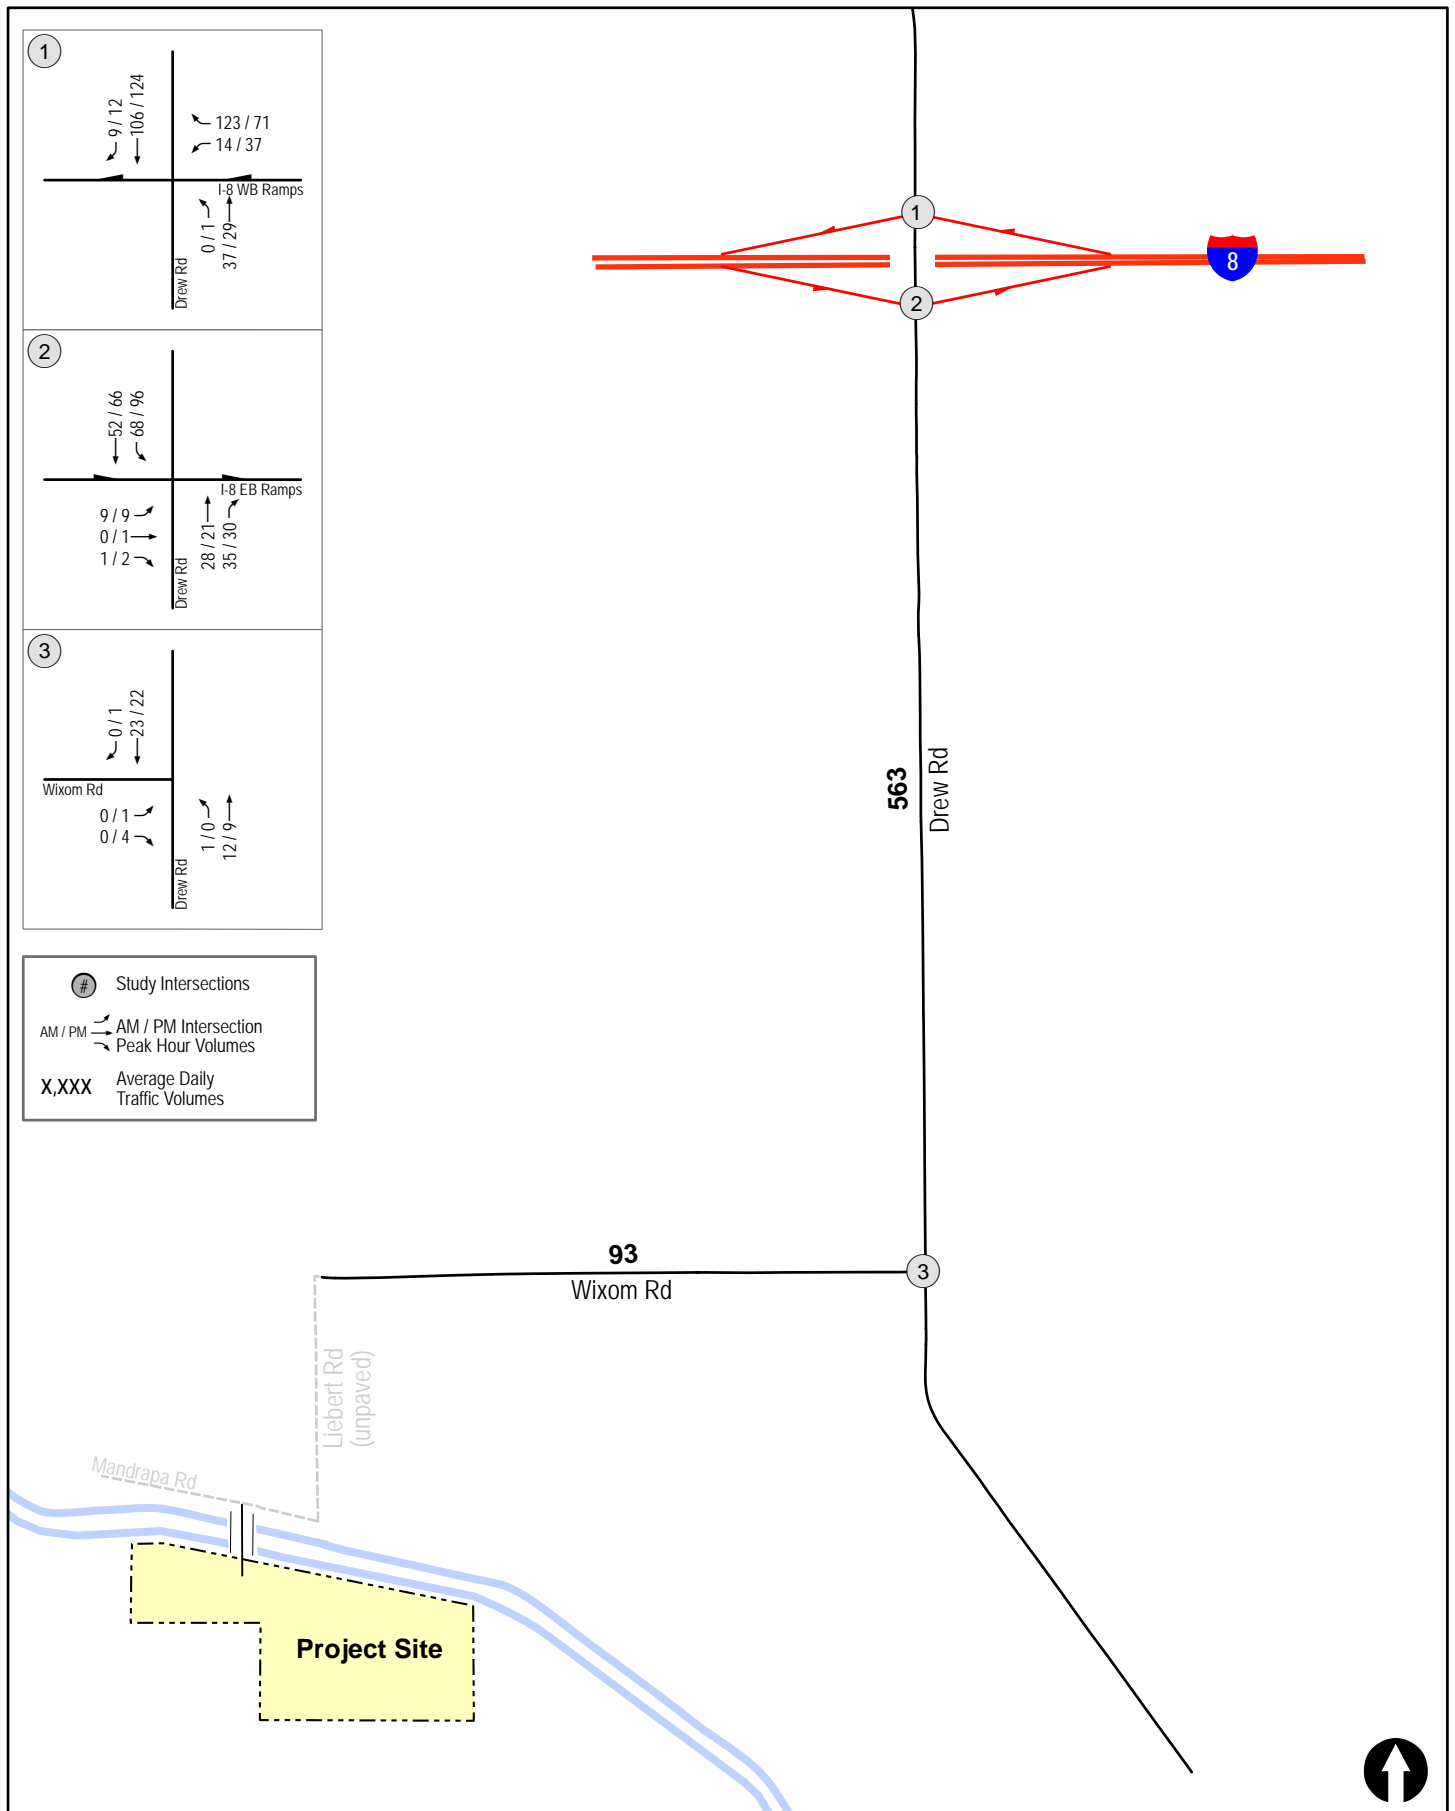

Figure 7-1

## Near-Term without Project Traffic Volumes

WESTSIDE CANAL BATTERY STORAGE COMPLEX PROJECT

PC ORIGINAL PKG

## 8.0 PROJECT TRIP GENERATION, DISTRIBUTION, AND ASSIGNMENT

### 8.1 Project Trip Generation

The project will generate traffic in two distinct construction periods. The initial construction period would consist of the access road and bridge across the Westside Main Canal, which would require approximately 8 workers per day and would last for eight to nine months. Following completion of the access road and bridge over the Westside Main Canal, the project would grade the entire project site and begin construction of the utility-scale energy storage complex, lasting up to 32 months. This second construction period will have a maximum of 200 workers and 30 trucks per day. Since this second construction period would generate the greatest amount of trips on the roadway, it is the subject of this analysis.

Daily and peak hour trip generation rates and in/out splits were calculated for the peak construction period using detailed data developed for analysis of the Project's impacts. Construction activities would generally occur during an 8-hour-shift day. Generally, all employees would arrive prior to the morning peak commuter period (7:00 – 9:00 a.m.) and depart within the evening peak period (4:00 – 6:00 p.m.). Delivery truck trips are anticipated to be distributed generally evenly throughout the 8-hour-shift day. In order to provide a conservative analysis, all employees were assumed to arrive and depart during peak commute periods. In addition, no carpooling for construction employees was assumed.

A passenger-car-equivalent (PCE) factor of 2.5 was applied to heavy vehicles (per the Highway Capacity Manual or HCM) to account for their reduced performance characteristics in the traffic stream (e.g. starting, stopping, and maneuvering). This information was used in calculating the Project-generated average daily traffic (ADT).

**Table 8–1** tabulates the total daily and peak hour Project traffic volumes. The Project trip generation is calculated to be 550 ADT with 200 inbound/ 20 outbound trips during the AM peak hour and 20 inbound/ 200 outbound trips during the PM peak hour. These values include the heavy-vehicle PCE-adjustment.

Post-construction, the facility will operate with up to 20 full-time employees on site. Therefore, an analysis of the post-construction scenario was not conducted.

TABLE 8-1  
PHASE 2 CONSTRUCTION PROJECT TRIP GENERATION

Use	Size	PCE <sup>a</sup>	Daily Trips		AM Peak Hour		PM Peak Hour	
			Rate (In + Out)	Volume (ADT) <sup>b</sup>	Volume		Volume	
					In	Out	In	Out
Personnel	200	1.0	2.0 /personnel	400	190	10	10	190
Trucks	30	2.5	2.0 /truck	150	10	10	10	10
<b>Subtotal</b>	-	-	-	<b>550</b>	<b>200</b>	<b>20</b>	<b>20</b>	<b>200</b>

**Footnotes:**

- a. PCE = Passenger Car Equivalent.
- b. ADT = Average Daily Traffic.

**General Notes:**

- 1. To estimate the employee traffic, it is conservatively assumed that 100% of the employee traffic would access the work area during the normal commuter peak hours (7:00 – 9:00 a.m. & 4:00 – 6:00 p.m.).
- 2. The In/Out splits assumed are 95:5 during AM peak hour and 5:95 during the PM peak hour.
- 3. Truck trips are estimated to occur relatively evenly throughout an 8-hour construction hours proposed for the Project. For 30 trucks with an equivalent of 150 ADT, this calculates to approximately 20 trucks/hour.

## 8.2 Project Trip Distribution and Assignment

Based on the information provided by the applicant, the personnel and construction truck trips will come from both east and west of the Project site via I-8.

A trip distribution and assignment were prepared for truck and employee trips to represent the distribution of Project traffic. The construction route is assumed to be I-8 to Drew Road to Wixom Road to Liebert Road.

**Figure 8-1** depicts the Project Traffic Distribution, while **Figure 8-2** depicts the Project Traffic Volumes.

**Figure 8-3** shows the Near-Term with Project Construction Traffic Volumes.

Figure 8-1

## Project Traffic Distribution

## 9.0 ANALYSIS OF NEAR-TERM WITH PROJECT CONDITIONS

### 9.1 Peak Hour Intersection Levels of Service

**Table 9-1** summarizes the Near-Term with Project intersections level of service. As seen in *Table 9-1*, with the addition of Project traffic, all intersections are calculated to operate at acceptable LOS B or better.

No significant Project impacts are calculated.

**Appendix F** contains the Near-Term with Project intersection analysis worksheets.

TABLE 9-1  
NEAR-TERM INTERSECTION OPERATIONS

Intersection	Jurisdiction	Control Type	Critical Movement	Peak Hour	Existing		Near-Term without Project		Near-Term with Project			Impact Type
					Delay <sup>a</sup>	LOS <sup>b</sup>	Delay	LOS	Delay	LOS	$\Delta$ <sup>c</sup>	
1. Drew Road / I-8 WB Ramps	Caltrans	MSSC <sup>d</sup>	WB	AM	9.3	A	9.4	A	10.7	B	1.3	None
				PM	9.0	A	9.0	A	9.7	A	0.7	None

**Footnotes:**

a. Capacities based on Imperial County Standard Street Classification Table.

b. ADT = Average Daily Traffic Volumes.

c. LOS = Level of Service.

d. V/C = Volume to Capacity ratio.

e. “ $\Delta$ ” denotes the increase in V/C ratio due to the addition of Project traffic.

f. Both roadway segments are currently built as two-lane roads. Roadway capacities were conservatively assumed as half of the Local Collector capacities from the Imperial County Standard Street Classification table.

## 10.0 SUMMARY AND CONCLUSIONS

Per the established significance thresholds and the analysis methodology presented in this report, Project-related traffic is not calculated to cause any significant impacts within the study area. No mitigation measures are required or proposed.

## APPENDIX B

### HCM INTERSECTION METHODOLOGY

## HIGHWAY CAPACITY 6<sup>th</sup> EDITION MANUAL

### LEVEL OF SERVICE CRITERIA FOR UNSIGNALIZED INTERSECTIONS

In the Highway Capacity Manual 6<sup>th</sup> Edition (HCM 6), Level of Service for unsignalized intersections is determined by the computed or measured control delay and is defined for each minor movement. Level of Service is not defined for the intersection as a whole. Delay is a measure of driver discomfort, frustration, fuel consumption, and lost travel time. The criteria are given in the following table, and are based on the average control delay for any particular minor movement.

LEVEL OF SERVICE	AVERAGE CONTROL DELAY SEC/VEH			EXPECTED DELAY TO MINOR STREET TRAFFIC
A	0.0	≤	10.0	Little or no delay
B	10.1	to	15.0	Short traffic delays
C	15.1	to	25.0	Average traffic delays
D	25.1	to	35.0	Long traffic delays
E	35.1	to	50.0	Very long traffic delays
F		>	50.0	Severe congestion

Level of Service F exists when there are insufficient gaps of suitable size to allow a side street demand to safely cross through a major street traffic stream. This Level of Service is generally evident from extremely long control delays experienced by side-street traffic and by queuing on the minor-street approaches. The method, however, is based on a constant critical gap size; that is, the critical gap remains constant no matter how long the side-street motorist waits. LOS F may also appear in the form on side-street vehicles selecting smaller-than-usual gaps. In such cases, safety may be a problem, and some disruption to the major traffic stream may result. It is important to note that LOS F may not always result in long queues but may result in adjustments to normal gap acceptance behavior, which are more difficult to observe in the field than queuing.

In most cases at Two-Way Stop Controlled (TWSC) intersections, the critical movement is the minor-street left-turn movement. As such, the minor-street left-turn movement can generally be considered the primary factor affecting overall intersection performance. The lower threshold for LOS F is set at 50 seconds of delay per vehicle. There are many instances, particularly in urban areas, in which the delay equations will predict delays of 50 seconds (LOS F) or more for minor-street movements under very low volume conditions on the minor street (less than 25 vehicle/hour). Since the first term of the equation is a function only of the capacity, the LOS F threshold of 50 sec/vehicle is reached with a movement capacity of approximately 85 vehicle/hour or less.

This procedure assumes random arrivals on the major street. For a typical four-lane arterial with average daily traffic volumes in the range of 15,000 to 20,000 vehicles per day (peak hour, 1,500 to 2,000 vehicle/hour), the delay equation used in the TWSC capacity analysis procedure will predict 50 seconds of delay or more (LOS F) for many urban TWSC intersections that allow minor-street left-turn movements. **The LOS F threshold will be reached regardless of the volume of minor-street left-turn traffic.** Notwithstanding this fact, most low-volume minor-street approaches would not meet any of the volume or delay warrants for signalization of the *Manual on Uniform Traffic Control Devices* (MUTCD) since the warrants define an asymptote at 100 vehicle/hour on the minor approach. As a result, many public agencies that use the HCM 6 Level of Service thresholds to determine the design adequacy of TWSC intersections may be forced to eliminate the minor-street left-turn movement, even when the movement may not present any operational problem, such as the formation of long queues on the minor street or driveway approach.

## APPENDIX C

### IMPERIAL COUNTY STANDARD STREET CLASSIFICATION TABLE

**IMPERIAL COUNTY STANDARD STREET CLASSIFICATION  
AVERAGE DAILY VEHICLE TRIPS**

ROAD		LEVEL OF SERVICE				
CLASS	X-SECTION	A	B	C	D	E
Expressway	128/210	30,000	42,000	60,000	70,000	80,000
Prime Arterial	106/136	22,200	37,000	44,600	50,000	57,000
Minor Arterial	82/102	14,800	24,700	29,600	33,400	37,000
Collector	64/84	13,700	22,800	27,400	30,800	34,200
Local Collector	40/70	1,900	4,100	7,100	10,900	16,200
Residential Street	40/60	*	*	<1,500	*	*
Residential Cul-de-Sac / Loop Street	40/60	*	*	< 200	*	*
Industrial Collector	76/96	5,000	10,000	14,000	17,000	20,000
Industrial Local Street	44/64	2,500	5,000	7,000	8,500	10,000

\* Levels of service are not applied to residential streets since their primary purpose is to serve abutting lots, not carry through traffic. Levels of service normally apply to roads carrying through traffic between major trip generators and attractors.

## Executive Summary

This report provides the results of the noise analysis performed for the proposed Westside Canal Battery Storage Project (Project) in Imperial County, California. The Project site consists of approximately 148 acres of agriculturally-zoned land located in the unincorporated Mount Signal area of the County, approximately 8.0 miles southwest of the city of El Centro (Assessor Parcel Numbers [APNs] 051-350-010 and 051-350-011). The Project site is located approximately one-third mile north of the Imperial Valley Substation (IV Substation) and directly south of the intersection of Liebert Road and the Imperial Irrigation District's (IID) Westside Main Canal. The Project site is bounded by the Westside Main Canal to the north, Bureau of Land Management (BLM) lands to the south and west, and vacant private land to the east. The Campo Verde solar generation facility is located north of the Project site, across the Westside Main Canal.

The two Project parcels are proposed for development as a utility-scale energy storage complex. The Project would also utilize portions of two parcels located north of the Westside Main Canal (APN 051-350-019 owned by IID and APN 051-350-018 owned by a private landowner) for site access and as a temporary construction staging area. The Project would also access a small portion of APN 051-350-009 within an IID easement for connection to the existing IID Campo Verde – Imperial Valley 230 kilovolt radial gen-tie line during the construction of a switching station on the Project site.

## Construction Noise

Noise associated with the site preparation and facility installation would potentially result in short-term impacts to surrounding properties. Construction would include the use of a variety of noise-generating equipment such as scrapers, excavators, loaders, and water trucks, along with others. Construction of the access road and the bridge over the Westside Main Canal and would last for eight to nine months. The Project would then grade the entire site and construct the utility-scale energy storage complex, which would last for up to 32 months.

The County of Imperial (County) General Plan Noise Element establishes construction time of day restrictions and noise level limits. Construction activities may only occur Monday through Friday between the hours of 7:00 a.m. and 7:00 p.m. or Saturday between the hours of 9:00 a.m. and 5:00 p.m., excluding holidays. Additionally, construction noise may not exceed 75 A-weighted decibel [dB(A)] 8-hour equivalent noise level [ $L_{eq(8h)}$ ] at the nearest sensitive receptor. Noise levels were modeled at six specific receivers located at the nearest residential properties. As calculated in this analysis, maximum construction noise levels would be well less than 75 dB(A)  $L_{eq(8h)}$ . Additionally, noise levels associated with temporary construction traffic (workers and deliveries) would be well below 75 dB(A)  $L_{eq(8h)}$ . Impacts would be less than significant.

## Operational Noise

Stationary sources of noise associated with the operation of the Project would include air cooling units, inverters, transformers, a substation, and transmission gen-tie lines. The Operations & Maintenance (O&M) building would also include a heating, ventilation, and air conditioning (HVAC) unit(s). The County Code of Ordinances establishes property line noise standards for residential, commercial, light industrial, and general industrial zoning districts. The Project site and all surrounding properties are in agricultural zoning districts. The Project proposes a General Plan Amendment and Rezone to change land use designation and zoning for the Project site Agriculture (A3) to Industrial. The applicable noise level limit for the adjacent agricultural uses is 70 dB(A)  $L_{eq}$  at the receiving property line. As calculated in this analysis, noise associated with Project operation would not exceed the applicable property line noise level limit of 70 dB(A)  $L_{eq}$  at the adjacent properties. Additionally, noise levels would be less than the most restrictive noise limit of 45 dB(A)  $L_{eq}$  for low-density residential uses at the nearest residential receivers. Impacts due to on-site generated noise would be less than significant.

## Traffic Noise

During operations, Project-generated traffic would increase volumes on local roadways and thereby increase traffic noise levels in the Project area. Project trip generation would be extremely limited—up to 40 trips per day. Operational ambient noise level increases attributable to Project-generated traffic are anticipated to be less than 3 dB(A) and thus would be less than barely perceptible. Impacts would be less than significant.

# 1.0 Introduction

## 1.1 Purpose of the Report

This report evaluates the significance of potential noise impacts associated with the Westside Canal Battery Storage Project (Project) in comparison to noise limits established by Imperial County.

## 1.2 Project Description

Westside Canal Battery Storage, LLC (Project Proponent), a subsidiary of Con Edison Clean Energy Businesses, is proposing to develop, design, construct, own, operate, and maintain the Westside Canal Battery Storage Project (Project), a utility-scale energy storage complex with a capacity of up to 2,000 megawatts (MW). The Project would store energy generation from the electrical grid, and optimally discharge that energy back into the grid as firm, reliable generation and/or grid services.

The Project would be comprised of lithium-ion battery and/or flow battery energy storage facilities, a behind-the-meter solar energy facility, a new on-site 230 kilovolt (kV) loop-in switching station, a 34.5 kV to 230 kV substation, underground electrical cables, and permanent vehicular access to and from the site over a proposed bridge spanning Imperial Irrigation District's (IID's) Westside Main Canal. The proposed loop-in switching station would connect the Project to the existing IID Campo Verde – Imperial Valley 230 kV radial gen-tie line, which connects to the Imperial Valley Substation (IV Substation) and the California Independent System Operator (CAISO), approximately one-third mile south of the Project site. The Project Proponent has submitted the necessary Interconnection Request Applications to the CAISO and IID.

The Project would complement both the existing operational renewable energy facilities, as well as those planned for future development in Imperial County (County), and would support the broader southern California bulk electric transmission system by serving as a firm, dispatchable resource.

The Project is pursuing the following objectives:

- To receive grid energy during beneficial market and operational periods and store that energy for dispatch when the customer (i.e., a load-serving entity) deems it to be more valuable.
- To be a valuable resource in allowing the customer and system operators to manage the effect of intermittent renewable generation on the grid and create reliable, dispatchable generation upon demand.
- To utilize available land that has not been used for agricultural production for more than 15 years, and enhance the site location by providing for permanent vehicular access.

## 1.2.1 Project Location

The Project would be located in the unincorporated Mount Signal area of the County, approximately 8.0 miles southwest of the city of El Centro and approximately 5.3 miles north of the U.S.-Mexico border. Figure 1 shows the regional location of the Project. The Project site is comprised of two parcels owned by the Project Proponent, Assessor Parcel Number (APN) 051-350-010 and APN 051-350-011, totaling approximately 148 acres. These parcels have limited access corridors for vehicular traffic and are considered less desirable for agricultural production, as reflected by the last 15 years during which no farming activity has occurred. The Project site is approximately one-third mile north of the IV Substation and directly south of the intersection of Liebert Road and the IID's Westside Main Canal. The Project site is bounded by the Westside Main Canal to the north, Bureau of Land Management (BLM) lands to the south and west, and vacant private land to the east. The Campo Verde solar generation facility is located north of the Project site, across the Westside Main Canal. Figure 2 shows an aerial photograph of the Project site and the above-mentioned nearby facilities.

The two Project parcels are proposed for development as a utility-scale energy storage complex. The Project would also utilize portions of two parcels located north of the Westside Main Canal (APN 051-350-019 owned by IID and APN 051-350-018 owned by a private landowner) for site access and as a temporary construction staging area. The Project would also access a small portion of APN 051-350-009 within an IID easement for connection to the existing IID Campo Verde – Imperial Valley 230 kV radial gen-tie line during the construction of a substation on the Project site. The total proposed Project development footprint, encompassing both temporary and permanent impacts, would be approximately 163 acres.

## 1.2.2 Project Components

Figure 3a shows the conceptual site plan for the Project with a representation of the various energy storage technologies, behind-the-meter ground- and roof-mounted solar, common facilities within the Project site, and permanent vehicular access to the Project site. The actual configuration of the Project would depend on the size of individual phases and the type of battery technology deployed. Specific Project components are described below.

### 1.2.2.1 Phasing and Schedule

The Project would be constructed in three to five phases over a 10-year period, with each phase ranging from approximately 25 MW up to 400 MW per phase. Depending on the size of the battery system for a given phase, construction and commissioning (approval to operate) is anticipated to take approximately 6 to 12 months. For the purposes of this analysis, the applicant has assumed that construction activities would last for approximately 32 months to complete the full Project build-out.

 Project Boundary

FIGURE 2  
Project Location on  
Aerial Photograph

FIGURE 3a  
Site Plan

Construction of the 100- to 200-MW first phase would include roads, a permanent clear-span bridge across the Westside Main Canal, the Operations and Maintenance (O&M) facilities, water connections and water-mains, storm water retention, switching station and Project substation, legal permanent vehicle access, as well as the first energy storage facility. To access the Project site, construction workers would travel along Interstate 8 (I-8) and head 4.6 miles south to the Project site, and would utilize the IID Fern Check Bridge as a temporary pedestrian bridge until the permanent bridge is constructed. During peak construction activities, approximately 200 workers and approximately 30 daily deliveries would be required. If approved, it is anticipated that construction of the first phase would begin in 2021.

It is anticipated that each subsequent phase would be constructed within one to two years of each other, with the timing and size of each phase dependent on market conditions and the applicant's ability to secure commercial contracts with prospective customers. With the Project being built in phases, the necessary infrastructure, such as water mains, retention ponds, and access roads, would be built out to serve the Project phases from west to east and expanded over time to serve each phase. These subsequent phases would require improvements such as additional substation equipment, water main and site road extension, but would not require construction of additional common facilities which would be completed during the first phase. The total nameplate (or rated capacity) capacity of the Project at full build-out (all phases completed) would be approximately 2,000 MW.

- Construction activities during all project phases would only occur Monday through Friday, between the hours of 7:00 a.m. and 7:00 p.m. or Saturday between the hours of 9:00 a.m. and 5:00 p.m., excluding holidays, per County Ordinance.

### 1.2.2.2 Common Components

As shown on the site plan (see Figure 3a), the northwest area of the Project serves as the location for the common facilities, which include the switching station and Project substation and the O&M facilities. A summary of the common facilities is presented below:

- 230 kV loop-in switching station
  - Connection to Campo Verde – Imperial Valley 230 kV radial transmission line
  - Located on applicant property
- Project substation
- O&M facilities
- Project parking
- Storm water retention basins
- Fencing and gates
- Interior access roads

Industrial buildings, warehouses, engineered containers, and/or electrolyte storage tanks would be the primary structures needed to house the main Project components. Other components to be located on the Project site and adjacent to the proposed buildings, warehouses, containers, and tanks include the following:

- Inverters, transformers, power distribution panels
- Underground water-main loop for Project operation and fire prevention
- Underground cable to connect to Project substation
- Project site access roads (unpaved/crushed rock)
- Fire water storage tanks
- Above ground water storage tanks
- Heating, Ventilation, and Air Conditioning (HVAC) units
- Ground-mounted or roof-mounted photovoltaic (PV) arrays
- Emergency backup generator(s)

### **a. O&M Facilities**

The O&M facilities are expected to be the only manned facility on the site. It would include up to approximately 20 full-time employees depending upon the number of phases and type of energy storage facility constructed. O&M employees would work typical weekday hours but may work extended hours, including weekends and 24 hours a day, depending upon the operations and maintenance needs. No offices or staffed control centers would be located within the storage-specific warehouses/buildings. For sanitary waste, the Project would include a septic leach field to be located near the O&M facilities. The proposed O&M facilities would also require an HVAC unit.

### **b. Permanent Vehicle Access**

There are no circulation element roadways in the immediate vicinity of the Project site. The nearest freeways are I-8, located 4.6 miles north of the Project site, and State Route 98 (SR-98), located 5.2 miles south of the Project site. Drew Road, a two-lane collector, is located 1.3 miles east of the Project site. All other roadways in the immediate vicinity of the Project site are rural roadways. All roadways that would be used to access the Project site from I-8 are currently paved, except for the portion of Liebert Road south of Wixom Road. However, this segment would be paved or graveled prior to Project operation.

The Project is surrounded by private landowners to the east, BLM land to the south and west, and IID maintenance roads and Westside Main Canal to the north. Due to the Project site having no direct vehicular access routes, the applicant is proposing to construct roads on both the north and south sides of the Westside Main Canal on private land, and a new clear-span Imperial County-specified bridge over the Westside Main Canal.

The permanent new clear-span County-specified bridge would span the Westside Main Canal to connect to a proposed access road easement on the north side of the Westside Main Canal. The north side proposed access road would ultimately connect the Project to county road (CR) Liebert Road.

Construction of the permanent clear-span bridge spanning the IID's Westside Main Canal requires the Project Proponent to have access to both the north side and the south of the Canal to perform the necessary construction activities. In addition to being necessary to facilitate construction of the new permanent clear-span bridge, access from the south side of the Canal would allow the Project Proponent to commence construction on the first phase of the Project simultaneously, thereby shortening the duration of construction and potentially minimizing the associated impacts. The Project Proponent is evaluating various options for temporary construction access, including accessing the Project site from the south side of the Westside Main Canal off SR-98, as well as options involving access from the north side of the Westside Main Canal from I-8.

Option 1 would use the existing SDG&E maintenance road off Highway 98, which extends approximately 4.4 miles to the IV Substation. Option 1 would then continue along an existing 1.2-mile-long dirt access road that leads north, then east, outside the western and northern boundaries of the substation. Option 1 then continues northwest along an existing dirt access road that parallels two power lines until the access road connects with the western edge of the Project. The existing dirt road was constructed for the construction and maintenance of the existing Campo Verde – Imperial Valley gen-tie line. Option 2 would use the existing IID Westside Main Canal access road. The selected temporary access option would be used until construction of the permanent bridge is completed. Both temporary construction access routes are presented in Figure 3b.

### **1.2.2.3 Battery Storage Components**

The first phase of site construction would consist of either a lithium-ion battery storage facility or a flow battery storage facility. This first phase would be dependent on the first commercial contract awarded to the applicant by a customer. Large industrial buildings, warehouses, and/or containers to house the storage equipment, including battery cells, modules, racks, and controls for lithium-ion technologies, would be needed. For flow battery technologies, cell stack modules, pumps, and controls may be installed inside industrial buildings or pre-engineered outdoor enclosures. Electrolyte storage tanks and associated piping may be located indoors or outdoors, depending on the technology.

#### **a. Battery Modules Technology**

##### ***Energy Storage***

Energy storage is the capture of energy produced at one time for use at a later time. A device that stores energy is generally called an accumulator or battery. Energy storage involves converting energy from forms that are difficult to store to more conveniently or economically storable forms. For the purpose of grid connected energy storage, electrical energy will be stored in the form of chemical energy in lithium-ion and/or flow batteries. Energy storage technology may be centralized or may be distributed throughout the plant. Due to requirements for energy storage, the Project components such as the switching station, substation, transformers, and inverters would be energized at all times with the potential to charge or discharge.

### ***Lithium-Ion Battery***

A lithium-ion battery is a type of rechargeable battery in which lithium ions move from the negative electrode through an electrolyte to the positive electrode during discharge, and back when charging. Lithium-ion batteries use an intercalated lithium compound as the material at the positive electrode and typically graphite at the negative electrode. The batteries have a high energy density, no memory effect and low self-discharge.

### ***Flow Battery***

A flow battery is a rechargeable fuel cell in which an electrolyte containing one or more dissolved electroactive elements flows through an electrochemical cell that reversibly converts chemical energy directly to electricity. Additional electrolyte is stored externally, generally in tanks, and is usually pumped through the cell (or cells) of the reactor, although gravity feed systems are also known to be used. Flow batteries can be rapidly "recharged" by replacing the electrolyte liquid while simultaneously recovering the spent material for re-energization. Many flow batteries use carbon felt electrodes due to its low cost and adequate electrical conductivity.

## **b. Backup Generators**

The Project would include emergency backup generator(s) to supply auxiliary power to the facility during rare events in which the entire facility or portions of the facility are disconnected from the electrical grid. The Project would use a hybrid approach to emergency backup power supply. Rather than relying exclusively on backup generators, the hybrid approach involves dedicating a portion of the battery storage system capacity as a source of emergency backup power. The reserved battery storage capacity would be approximately 3 to 4 percent of the size of the constructed battery storage system. This hybrid approach would also rely on the use of on-site, behind-the-meter solar power generation to supplement the facility's backup power supply needs. Additionally, propane-fueled generators would augment the backup battery storage capacity and the behind-the-meter solar power generation.

The generators would be sized to accommodate control systems and HVAC loads for equipment protection. Approximately 1.25 MW of backup power generation would be needed for every 100 MW of installed battery storage capacity. Each propane-fueled generator would have a capacity of 150 kW or larger. The purpose of the generators would be to provide system safety for events in which the transmission interconnection and the on-site solar generation system are not available, by supplying the battery HVAC system to maintain battery safety and warranty temperature parameters.

The propane-fueled generators would be installed in a central location near the common facilities or distributed among individual buildings or containers. The generators would be periodically tested (monthly) to maintain backup capability in the event of a grid outage. All generators would be subject to Imperial County Air Pollution Control District review and permitting requirements.

#### **1.2.2.4 Solar Facility Components**

Photovoltaic solar cells, also called PV cells, convert sunlight directly into electricity. PV gets its name from the process of converting light (photons) to electricity (voltage), which is called the PV effect. The panels are mounted at a fixed angle facing south, or they can be mounted on a tracking device that follows the sun, allowing them to capture the most sunlight. Many solar panels combined together to create one system is called a solar array. On-site, behind the meter, PV solar generation would serve as station auxiliary power and be deployed throughout the Project site.

#### **1.2.3 Site Security**

A six-foot-tall fence (e.g., chain-link) topped with one-foot-tall barbed wire would be installed around the entire Project site for safety and in order to control access. The switching station and each substation proposed on the site plan would also have fences installed around its perimeter. A camera-equipped call button would be installed at the front entry gate to the site which would be monitored from the Project's O&M facilities. Throughout the site at various points, security cameras may be installed to monitor other areas of the Project site. During the construction of each Project phase, the applicant would have on-site security personnel between dusk and dawn and during hours of non-active construction.

#### **1.2.4 Interconnection Options**

The proposed point of interconnection for the Project is the IV Substation 230 kilovolt (kV) bus. As reflected in the conceptual site plan, to achieve this, the applicant plans to build a new loop-in switching station on the Project site and connect to the existing IID Campo Verde – Imperial Valley 230 kV radial gen-tie line. This existing gen-tie line ultimately connects to the IV Substation one-third mile south of the Project site. This location would serve as the Project's point of interconnection to the CAISO grid. The applicant has submitted the necessary Interconnection Request Applications to the CAISO.

#### **1.2.5 Existing and Proposed Utility Easements**

##### **a. Existing Easements**

The Project site (APNs 051-350-10 and 051-350-011) has three major easements lying across the site. The first is for overhead collector transmission circuits and utility facilities, as well as access. This is for the IID Campo Verde – Imperial Valley 230 kV transmission line easement, which lies inside and along the west property line and runs north/south.

The second major easement is a prescriptive easement for an overhead transmission circuit and a utility distribution line that runs north and south and lies directly in the center of the Project site. The IID transmission line within this prescriptive easement is known as the S-Transmission line (S-Line). The third major easement lies along the north property line. This easement was granted to IID for the purposes of the existing Westside Main Canal and

appropriate infrastructure and operation and maintenance roads adjacent to the Westside Main Canal.

## **b. Proposed Easements**

The applicant and IID are in the process of determining the width of this S-Line easement to create a non-exclusive easement. This easement would also include the existing distribution line that lies within the easement. Until this new easement agreement is in place, the applicant has planned for a 300-foot temporary corridor on the Project site plan (centerline of 300-foot corridor is the S-Line) to allow the IID energy engineering team to design and implement an appropriate new easement. Once the width and location of the new easement is determined, all other areas not part of the new S-Line easement lying within the 300-foot corridor will become part of the Project site.

## **1.2.6 Project Operation**

Operation of the Project would require routine maintenance and security. It is anticipated that the Project would employ a plant manager and an O&M manager, as well as the addition of a facility manager once the complex deploys approximately 500 MW of generation. The complex will also employ staff technicians, with at least one additional technician for every approximately 250 MW of capacity.

Operation of the Project at full build-out would require up to approximately 20 full-time employees depending upon the number of phases and type of energy storage facility constructed. The Project may require fewer full-time equivalent employees, but 20 were assumed to provide a conservative estimate. O&M employees would work typical weekday hours but may work extended hours, including weekends and 24 hours a day, depending upon the operations and maintenance needs. Assuming two one-way trips per employee, the Project would be anticipated to generate up to 40 trips per day from all maintenance and security personnel.

Figure 3a shows the conceptual site plan for the Project with a representation of lithium-ion buildings and containers as well as flow buildings and containers. The components that make up the energy storage systems and common facilities require various preventative maintenance and at times corrective maintenance. The O&M staff would maintain the Project in accordance with manufacturer and industry best practice maintenance schedules and requirements. Depending on the technology selected for the energy storage component, the substation and transmission lines as well as the behind-the-meter solar inverters and transformers would be energized at all times.

## **1.2.7 Discretionary Actions**

### **1.2.7.1 General Plan Amendment and Rezone**

The Project proposes a General Plan Amendment and Rezone to change the land use designation and zoning for the Project site from Agriculture (A3) to Industrial. The Industrial zoning would be limited to Energy Production/Use.

### **1.2.7.2 Development Agreement**

The applicant may pursue a development agreement with the County of Imperial for this project.

## **1.3 Fundamentals of Noise**

Noise is defined as a loud or unpleasant sound that causes disturbance. Sound levels are described in units called the decibel (dB). Decibels are measured on a logarithmic scale that quantifies sound intensity in a manner similar to the Richter scale used for earthquake magnitudes. Thus, a doubling of the energy of a noise source, such as doubling of traffic volume, would increase the noise level by 3 dB; a halving of the energy would result in a 3 dB decrease.

In technical terms, sound levels are described as either a “sound power level” or a “sound pressure level,” which while commonly confused are two distinct characteristics of sound. Sound pressure levels are a measured or modeled noise level at a certain distance from the noise source, while sound power levels are the rate at which sound energy is emitted, reflected, transmitted, or received, per unit time, and is not dependent on distance from the noise source. Both share the same unit of measure, the dB. However, sound power, expressed as  $L_{pw}$ , is the energy converted into sound by the source. As sound energy travels through the air, it creates a sound wave that exerts pressure on receivers such as an eardrum or microphone, the sound pressure level. Sound measurement instruments only measure sound pressure, and limits used in standards are generally sound pressure levels.

The human ear is not equally sensitive to all frequencies within the sound spectrum. To accommodate this phenomenon, the A-scale, which approximates the frequency response of the average young ear when listening to most ordinary everyday sounds, was devised. When people make relative judgments of the loudness or annoyance of a sound, their judgments correlate well with the A-scale levels of those sounds. Therefore, the “A-weighted” noise scale is used for measurements and standards involving the human perception of noise.

Noise levels using A-weighted measurements are designated with the notation dB(A). Changes in noise levels are generally perceived by the average human ear as follows: 3 dB(A) is barely perceptible, 5 dB(A) is readily perceptible, and 10 dB(A) is perceived as a doubling or halving of noise (Caltrans 2013).

### 1.3.1 Descriptors

The impact of noise is not a function of loudness alone. The time of day when noise occurs and the duration of the noise are also important. In addition, most noise that lasts for more than a few seconds is variable in its intensity. Consequently, a variety of noise descriptors has been developed. Consistent with the County's General Plan Noise Element, the noise descriptors used for this study are the equivalent noise level ( $L_{eq}$ ) and the community noise equivalent level (CNEL). The  $L_{eq}$  is the equivalent steady-state noise level in a stated period of time that is calculated by averaging the sound energy over a time period; when no period is specified, a 1-hour period is assumed. The CNEL is a 24-hour equivalent sound level.

The CNEL calculation applies an additional 5 A-weighted decibels dB(A) penalty to noise occurring during evening hours, between 7:00 p.m. and 10:00 p.m., and a 10 dB(A) penalty is added to noise occurring during the night, between 10:00 p.m. and 7:00 a.m. These increases for certain times are intended to account for the added sensitivity of humans to noise during the evening and night.

### 1.3.2 Propagation

Sound from a small, localized source (approximating a "point" source) radiates uniformly outward as it travels away from the source in a spherical pattern, known as geometric spreading. The sound level decreases or drops off at a rate (drop-off rate) of 6 dB(A) for each doubling of the distance.

Traffic noise is not a single, stationary point source of sound. The movement of vehicles makes the source of the sound appear to emanate from a line (line source) rather than a point when viewed over some time interval. The drop off rate for a line source is 3 dB(A) for each doubling of distance.

The propagation of noise is also affected by the intervening ground, known as ground absorption. A hard site (such as parking lots or smooth bodies of water) receives no additional ground attenuation, and the changes in noise levels with distance are simply the geometric spreading from the source, which equates to 6 dB(A) per doubling distance. A soft site (such as soft dirt, grass, or scattered bushes and trees) provides an additional ground attenuation value of 1.5 dB(A) per doubling of distance. Thus, a point source over a soft site would drop off at 7.5 dB(A) per doubling of distance.

## 2.0 Existing Conditions

### 2.1 Land Use Environment

The Project site was previously graded and used as farmland and has been fallow for more than 15 years. The General Plan land use designation and zoning for the Project site and all surrounding parcels to the north and east is Agriculture (A3). The General Plan land use designation for parcels to the south and west are designated open space/recreation areas;

zoning does not apply to these BLM lands. The Campo Verde solar generation facility is located north of the Project site and agricultural uses are located northeast of the Project site. Parcels farther north of the Project site also include a mix of agricultural uses and solar generation facilities. The parcel immediately east of the Project site is undeveloped. BLM land south and west of the Project site is generally undeveloped, relatively flat, and barren. The IV Substation is located approximately one-third mile south of the southern property line of the site.

## 2.2 Ambient Noise Environment

Existing noise levels at the Project site are typical of any rural agricultural environment, and are generally quiet. Existing noise levels at the Project site were measured on May 2, 2019 using one Larson-Davis LxT Sound Expert Sound Level Meter, serial number 3894. The following parameters were used:

Filter:	A-weighted
Response:	Slow
Time History Period:	5 seconds

The meter was calibrated before each measurement. The meter was set 5 feet above the ground level for each measurement. Noise measurements were taken to obtain typical ambient noise levels at the Project site and in the vicinity. The weather was warm and sunny. Two 30-minute measurements were taken, as described below. The measurement locations are shown on Figure 4, and detailed data is contained in Attachment 1.

Measurement 1 was located at the northern Project boundary, north of the Westside Canal and southeast of Campo Verde substation. The main source of noise at this location was the substation. Other sources of noise included occasional airplane and helicopter flyovers. The average measured noise level was 50.5 dB(A)  $L_{eq}$ .

Measurement 2 was located near the center of the Project site. The main source of noise at this location was humming from the existing power line. Other sources of noise included occasional airplane and helicopter flyovers. The average measured noise level was 45.9 dB(A)  $L_{eq}$ .

-  Measurement Locations

FIGURE 4  
Noise Measurement Location

## **3.0 Applicable Standards**

### **3.1 Imperial County General Plan Noise Element**

#### **3.1.1 Property Line Noise Level Limits**

The County General Plan Noise Element (Imperial County 2015) identifies property line noise level limits that apply to noise generation from one property to an adjacent property (excluding construction noise). As stated in the Noise Element, the property line noise level limits imply the existence of a sensitive receptor on the adjacent, or receiving, property. In the absence of a sensitive receptor, an exception or variance to the standards may be appropriate. The property line noise standards are codified in the County Code or Ordinances and thus are enumerated in the subsequent section (see Section 3.2).

#### **3.1.2 Construction Noise Standards**

County General Plan Noise Element Section IV.C.3 addresses noise generated by construction activities. It states:

- Construction noise, from a single piece of equipment or a combination of equipment, shall not exceed 75 dB  $L_{eq}$ , when averaged over an eight (8) hour period, and measured at the nearest sensitive receptor. This standard assumes a construction period, relative to an individual sensitive receptor of days or weeks. In cases of extended length construction times, the standard may be tightened so as not to exceed 75 dB  $L_{eq}$  when averaged over a one (1) hour period.
- Construction equipment operation shall be limited to the hours of 7 a.m. to 7 p.m., Monday through Friday, and 9 a.m. to 5 p.m. Saturday. No commercial construction operations are permitted on Sunday or holidays. In cases of a person constructing or modifying a residence for himself/herself, and if the work is not being performed as a business, construction equipment operations may be performed on Sundays and holidays between the hours of 9 a.m. and 5 p.m. Such non-commercial construction activities may be further restricted where disturbing, excessive, or offensive noise causes discomfort or annoyance to reasonable persons of normal sensitivity residing in an area.

Based on these standards, the applicable limit for Project construction activities is 75 dB(A)  $L_{eq}$  at the nearest sensitive receptor.

## 3.2 Imperial County Noise Abatement and Control

County Code of Ordinances Title 9, Division 7: Noise Abatement and Control, specifies noise level limits. Noise level limits are summarized in Table 1. Noise level limits do not apply to construction equipment.

Table 1 Imperial County Property Line Noise Limits		
Zone	Time	One-Hour Average Sound Level [dB(A) $L_{eq}$ ]
Low-Density Residential Zones	7:00 a.m. to 10:00 p.m.	50
	10:00 p.m. to 7:00 a.m.	45
Medium to High-Density Residential Zones	7:00 a.m. to 10:00 p.m.	55
	10:00 p.m. to 7:00 a.m.	50
Commercial Zones	7:00 a.m. to 10:00 p.m.	60
	10:00 p.m. to 7:00 a.m.	55
Manufacturing/Light Industrial/ Industrial Park Zones including agriculture	(anytime)	70
General Industrial Zones	(anytime)	75
SOURCE: Imperial County Noise Abatement and Control Ordinance, Tit. 9, Div. 7, § 90702.00(A).		

The Project would be zoned Medium Industrial (M2), which would be considered a General Industrial Zone, and all the surrounding properties are zoned Agriculture (A-3). When the noise-generating property and the receiving property have different uses, the more restrictive standards apply. Therefore, for Project operation, the property line noise level limit of 70 dB(A)  $L_{eq}$  for agricultural uses applies.

## 4.0 Analysis Methodology

Noise level predictions and contour mapping were developed using noise modeling software, SoundPlan Essential, version 4.1 (SoundPLAN; Navcon Engineering 2018). SoundPLAN calculates noise propagation based on the International Organization for Standardization method (ISO 9613-2—Acoustics, Attenuation of Sound during Propagation Outdoors). The model calculates noise levels at selected receiver locations using input parameter estimates such as total noise generated by each noise source; distances between sources, barriers, and receivers; and shielding provided by intervening terrain, barriers, and structures. The model outputs can be developed as noise level contour maps or noise levels at specific receivers. In all cases, receivers were modeled at 5 feet above ground elevation, which represents the average height of the human ear.

## 4.1 Construction Noise

As described in Section 1.2.2.1, the Project would be constructed in three to five phases over a 10-year period, with each phase ranging from approximately 25 MW up to 400 MW per phase. Depending on the size of the battery system for a given phase, construction and commissioning (approval to operate) is anticipated to take approximately 6 to 12 months. For the purposes of this analysis, the applicant has assumed that construction activities would last for approximately 32 months to complete the full Project build-out.

Construction of the 100 to 200 MW first phase would include roads, a permanent clear-span bridge across the Westside Main Canal, the Operations and Maintenance (O&M) facilities, water connections and water-mains, storm water retention, switching station and Project substation, legal permanent vehicle access, as well as the first energy storage facility. To access the Project site, construction workers would travel along Interstate 8 (I-8) and head 4.6 miles south to the Project site, and would utilize the IID Fern Check Bridge as a pedestrian bridge until the permanent bridge is constructed. During peak construction activities, approximately 200 workers and approximately 30 daily deliveries would be required. If approved, it is anticipated that construction of the first phase would begin in 2021. Construction staff and equipment will be determined based on the size and design specifications of each phase.

The equipment anticipated to be used in Project construction was provided by the applicant and is shown below in Table 2.

Table 2 Anticipated Construction Schedule and Equipment					
Construction Activity/ Equipment Type	Phase 1 (12 months)		Phases 2–5 (20 months)	Noise Level at 50 Feet [dB(A) $L_{eq}$ ]	Typical Duty Cycle
	Common Facilities	Battery Storage	Battery Storage		
Air Compressor	1	2	2	80	40%
Backhoe	2	2	2	80	40%
Concrete Pump	1	1	1	82	20%

Roller	3	2	2	74	40%
Scraper	1	1	1	85	40%
Water Truck <sup>2</sup>	2	1	1	73	--
Wheeled Loader	1	1	1	80	40%
Wheeled Tractor	1	--	--	84	40%
Sources: Federal Highway Administration [FHWA] 2006, Federal Transit Administration 2006.					
<sup>1</sup> The FHWA source does not provide forklift noise levels. Average noise level for a forklift was obtained from the SoundPLAN database (Navcon Engineering 2018).					
<sup>2</sup> The FHWA source does not provide water truck noise levels. Average noise level for a water truck was obtained from the City of Los Angeles (City of Los Angeles 2012).					

Construction equipment is not a fixed, stationary source of noise because equipment would move throughout the Project site. Sources that emit noise over a specified area, such as construction equipment over a Project site, are considered area sources. Construction noise levels were modeled as an area source over the anticipated construction area with the simultaneous operation of all required equipment listed in Table 2. It is unlikely that all equipment would operate at the same time. This is therefore a conservative analysis of maximum average hourly noise levels.

The Project site and the area surrounding all off-site roadway extensions are relatively flat. This analysis conservatively assumes no attenuation from barriers and topography.

Ground conditions typically change during construction due to fugitive dust control practices such as soil stabilization through site watering and best management practices such as subgrade compaction. This analysis conservatively models ground conditions as acoustically hard. Thus, construction noise would be characterized by hard site attenuation rate of 6 dB(A) per doubling of distance.

## 4.2 Operational Noise

Stationary sources of noise associated with the operation of the Project would include air cooling units, inverters, transformers, a substation, and transmission gen-tie lines. The O&M building would also include an HVAC unit.

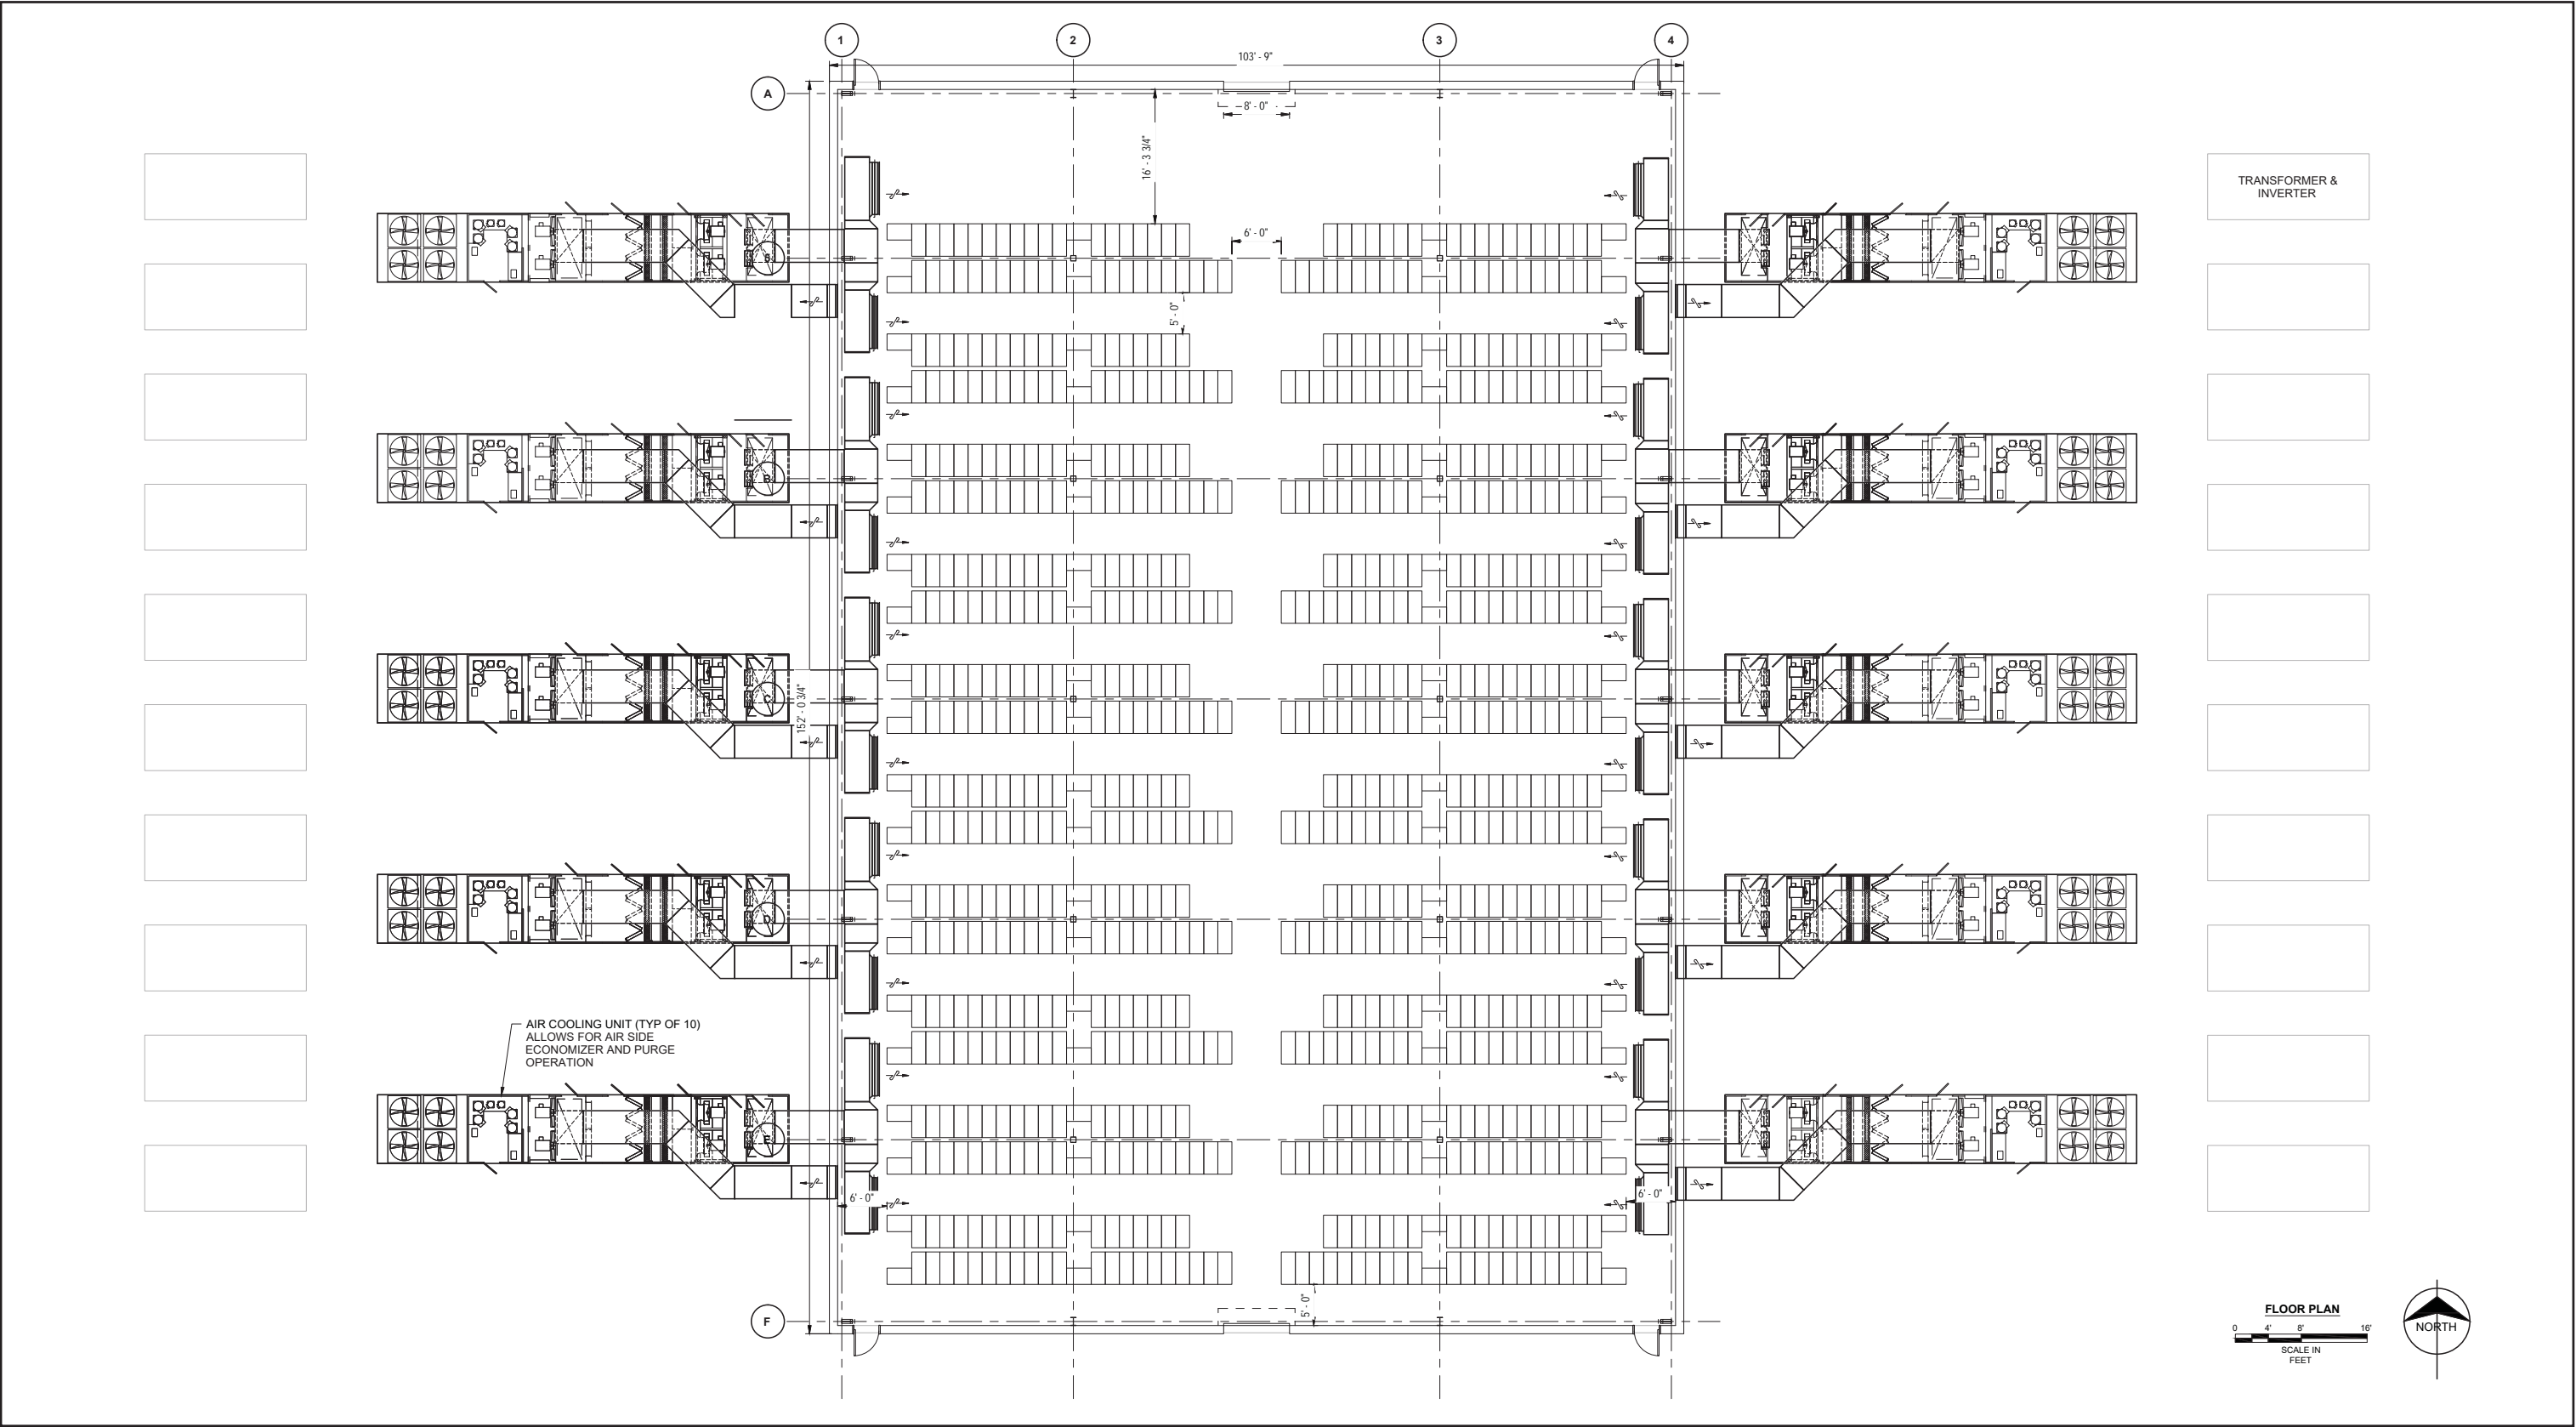

Figure 5 shows the floor plan for each lithium-ion 50 MW building. As shown, each building would include 10 air cooling units (5 on each side of the building) and 20 transformers and inverters (10 on each side of the building). The current site plan includes 20 of these buildings, and more would be constructed during subsequent phases as the market demands.

The main source of noise on the Project site would be generated by the air cooling units. The Project would include Carrier AC Chillers Model 30XV450 (Attachment 2) or equivalent. Based on manufacturer specifications, these units generate a sound power level of 106 dB(A) when operating at full capacity. This sound power level is equivalent to a sound pressure level of 74.4 dB(A)  $L_{eq}$  at 50 feet. As shown in Figure 5, these units would be located within a container enclosure. Based on standard attenuation rates, it is estimated that metal insulated containers could achieve an interior to exterior noise reduction of at least 15 dB(A). However, as a conservative analysis, no noise reduction was modeled. All air cooling units were modeled at full capacity during the daytime and nighttime hours.

As the solar generation facility would only generate electricity between sunrise and sunset, noise from solar field inverters and transformers would likely be limited to daylight hours. After daylight hours energy storage facilities may continue to contribute energy to the grid.

A single technology or provider has not been selected for the energy storage component of the Project. Energy storage technology may be centralized or may be distributed throughout the plant. Depending on the technology selected for the energy storage component, the substation and transmission lines as well as the solar field inverters and transformers may be active during both daylight and nighttime hours.

RECON

M:\JOBS5\8888\nos\graphics\fig5.ai

04/25/19 fmm

FIGURE 5  
Lithium Ion Building Floor Plan

Each lithium-ion building would also include 20 transformers and inverters. Based on information provided by the Project engineer, transformers generate a noise level of 85 dB(A) Leq at 3 feet, which is equivalent to a sound power level of 92.2 dB(A), and inverters generate a noise level of 80 dB(A) Leq at 3 feet, which is equivalent to a sound power level of 87.2 dB(A).

The Project would include the construction of a substation located at the western Project boundary. The substation would include equipment such as switches, circuit breakers, and transformers. Switches and circuit breakers do not typically generate substantial noise. The power rating for substation transformers would be several times higher than the power rating for transformers distributed throughout the facility at each solar array block. Based on National Electrical Manufacturers Association standards for oil-immersed transformers, a sound level of 67 dB(A) at 5 feet would be representative of the substation (National Electrical Manufacturers Association 2013). This equates to a sound power level of 97 dB(A).

The Project would also include transmission lines to connect the facility to neighboring substations. Corona discharge results from the partial breakdown of the electrical insulating properties of the air surrounding the conductors; energy discharged from the line may form small local pressure changes that result in audible hissing or crackling noises. The intensity of corona noise varies depending on the atmospheric conditions such as atmospheric moisture and pressure (which is related to altitude). The noise generated by similar transmission lines (i.e., approximately 230 kV) has previously been analyzed to be 25 dB(A) at 50 feet. This equates to a sound power level per length of 45 dB(A) per meter.

The proposed O&M building would also require an HVAC unit. Based on review of various manufacturer specifications, a representative sound power level of 79 dB(A) for a 10-ton unit was selected for analysis (Attachment 3). This HVAC unit was modeled at full capacity during the daytime and nighttime hours.

Based on these noise levels and the floor plan and the number of air cooling units, inverters, and transformers proposed for each lithium-ion building shown in Figure 5, and total composite noise level for each building was calculated. Table 3 summarizes noise levels for each noise source, and the total composite noise level for each lithium-ion building.

Table 3 Project Equipment Modeling Parameters	
Equipment	Exterior Sound Power Level
Lithium-ion Buildings	
<i>Air Cooling Units</i>	<i>106.0</i>
<i>Inverter</i>	<i>87.2</i>
<i>Transformer</i>	<i>92.2</i>
Total Composite Sound Power Level per Building	95.4
Substation	97.0
Gen-Tie Line	45 dB(A) per meter
O&M HVAC	79

## 4.3 Traffic Noise

Vehicle traffic would be generated during operation of the Project. It has been assumed that operation of the Project would require up to 20 employees. Assuming two one-way trips per employee, Project operation would be anticipated to generate up to 40 trips per day. Off-site traffic noise was modeled using the Federal Highway Administration (FHWA) Traffic Noise Prediction Model algorithms and reference levels.

## 5.0 Impact Analysis and Noise Environment

The following is a discussion of impacts associated with construction noise, operational noise, and off-site vehicle traffic noise. Impacts were evaluated using the following standards:

- Construction Noise: Construction noise may not exceed 75 dB(A)  $L_{eq(8h)}$  at the nearest sensitive receptor (County General Plan Noise Element Section IV.C.3)
- Operational Noise: Noise due to operation of the project shall not exceed 70 dB(A)  $L_{eq}$  at the property line (Imperial County Noise Abatement and Control Ordinance, Tit. 9, Div. 7, § 90702.00(A))
- Off-Site Traffic Noise: A permanent increase in ambient noise levels that is less than 3 dB(A) would be less than significant.

## 5.1 Construction Noise

Noise associated with the site preparation and facility installation would potentially result in short-term impacts to surrounding properties. As discussed in Section 4.1, noise levels were modeled as an area source over the anticipated construction area with the simultaneous operation of all required equipment listed in Table 1.

As discussed in Section 3.1, the County General Plan Noise Element establishes construction time of day restrictions and noise level limits. Construction activities may only occur Monday through Friday between the hours of 7:00 a.m. and 7:00 p.m. or Saturday between the hours of 9:00 a.m. and 5:00 p.m., excluding holidays. Additionally, construction noise may not exceed 75 dB(A)  $L_{eq(8h)}$  at the nearest sensitive receptor. Noise levels were modeled at six specific receivers located at the nearest residential properties.

Table 4 summarizes the maximum noise levels due to each construction activity. Construction noise contours are shown in Figures 6a and 6b. SoundPLAN data is provided in Attachment 4.

FIGURE 6a  
Construction Noise Contours –  
Common Facilities

- Project Boundary
- Site Plan
- Receivers
- Noise Contours
  - 60 dB(A) Leq
  - 65 dB(A) Leq

FIGURE 6b  
Construction Noise Contours –  
Battery Storage

<b>Table 4</b> <b>Construction Noise Levels</b> <b>[dB(A) <math>L_{eq}</math>]</b>			
Receiver	Phase 1		Phase 2-5
	Common Facilities	Battery Storage	Battery Storage
1	33	30	30
2	44	40	40
3	46	42	42
4	44	40	40
5	33	30	30
6	31	28	28

As shown, maximum construction noise levels would be well less than 75 dB(A)  $L_{eq(8h)}$ . Because these noise levels account for the simultaneous operation of all required equipment for each construction activity, actual noise levels would be less than those shown in Table 4. Therefore, impacts would be less than significant.

During peak construction activities, approximately 200 workers and approximately 30 daily deliveries would be required. There are residential uses located adjacent to the northern access route that would be used by construction workers during the entire construction phase and would be used by delivery trucks once the bridge construction is complete. Based on FHWA Traffic Noise Prediction Model, trips associated with 200 worker trips over a 1-hour period would generate a maximum noise level of 49 dB(A)  $L_{eq}$  at 50 feet from the roadway. Additionally, the delivery trucks, when distributed throughout the daytime hours, would generate a noise level of 50 dB(A)  $L_{eq}$  at 50 feet from the roadway. All residential uses are located more than 50 feet from the roadways. Noise levels associated with these trips would not exceed 75 dB(A)  $L_{eq}$ , and would be less than significant.

## 5.2 Operational Noise

Following the methodology discussed in Section 4.2, Operations Analysis, ground-floor noise level contours were modeled. Noise levels were also calculated at the six specific receivers located at the nearest residential properties. Noise contours are shown on Figure 7. SoundPLAN data for on-site generated noise modeling are contained in Attachment 5.

As discussed in Section 3.2, the County Code of Ordinances establishes property line noise standards for residential, commercial, light industrial, and general industrial zoning districts. The Project site and all surrounding properties are in agricultural zoning districts. The Project proposes a General Plan Amendment and Rezone to change land use designation and zoning for the Project site Agriculture (A3) to Industrial. The applicable noise level limit for the adjacent agricultural uses is 70 dB(A)  $L_{eq}$ .

- Project Boundary
- Site Plan
- Receivers
- Noise Contours**
- 45 dB(A) Leq
  - 50 dB(A) Leq
  - 55 dB(A) Leq
  - 60 dB(A) Leq
  - 65 dB(A) Leq
  - 70 dB(A) Leq
  - 75 dB(A) Leq

FIGURE 7  
Operational Noise Contours

As shown in Figure 7, noise associated with Project operation would not exceed the applicable limit of 70 dB(A)  $L_{eq}$  at the property line. Additionally, Table 5 summarizes the noise levels at the nearest residential properties. As shown, due to the distance between the Project site and these residential properties, noise levels would be less than the most restrictive noise limit of 45 dB(A)  $L_{eq}$  for low-density residential uses. Therefore, impacts related to on-site generated noise would be less than significant.

<b>Table 5</b> <b>Operational Noise Levels</b> <b>[dB(A) <math>L_{eq}</math>]</b>	
Receiver	Noise Level
1	32
2	42
3	44
4	42
5	32
6	30

## 5.3 Traffic Noise

Vehicle traffic would be generated during construction and operation of the Project. As discussed in Sections 1.2, a doubling of the energy of a noise source, such as doubling of traffic volume, would increase the noise level by 3 dB(A) and would generally be perceived by the average human ear as barely perceptible. For the purposes of this analysis, a permanent increase in the ambient noise levels that is less than 3 dB(A) would be less than significant.

During operations, the Project would require up to approximately 20 full-time equivalent employees, which would generate up to 40 trips per day. As Project trip generation would be extremely limited, the Project is not anticipated to result in a doubling of traffic along any well-traveled roadway. Based on FHWA Traffic Noise Prediction Model, roadways with traffic volumes of 20 average daily traffic and a speed limit of 25 miles per hour would result in a noise level of 33 dB(A)  $L_{eq}$  at 50 feet from the centerline of the roadway. For roadways where existing traffic volumes are equal to or less than 20 average daily traffic, Project-generated traffic may result in a 3 dB(A) traffic noise increase, however resulting traffic noise levels would remain less than generally ambient noise levels attributable to other sources. Ambient noise level increases attributable to Project-generated traffic are anticipated to be less than 3 dB(A). Therefore, impacts would be less than significant.

## 6.0 Conclusions

### 6.1 Construction Noise

Noise associated with the site preparation and facility installation would potentially result in short-term impacts to surrounding properties. Construction would include use of a variety of noise-generating equipment such as scrapers, excavators, loaders, and water trucks, along with others. Construction of the access road and the bridge over the IID canal and would last

for eight to nine months. Construction activities for the utility-scale energy storage complex would last for up to 32 months. The County General Plan Noise Element establishes construction time of day restrictions and noise level limits. Construction activities may only occur Monday through Friday between the hours of 7:00 a.m. and 7:00 p.m. or Saturday between the hours of 9:00 a.m. and 5:00 p.m., excluding holidays. Additionally, construction noise may not exceed 75 dB(A)  $L_{eq(8h)}$  at the nearest sensitive receptor.

Noise levels were modeled at six specific receivers located at the nearest residential properties. As shown in Table 4, maximum construction noise levels would be well below 75 dB(A)  $L_{eq(8h)}$ . Additionally, noise levels associated with temporary construction traffic (workers and deliveries) would be well below 75 dB(A)  $L_{eq(8h)}$ . Therefore, impacts would be less than significant.

## 6.2 Operational Noise

Stationary sources of noise associated with the operation of the Project would include air cooling units, inverters, transformers, a substation, and transmission gen-tie lines. The O&M building would also include an HVAC unit. Noise associated with Project operation would not exceed the applicable property line noise level limit of 70 dB(A)  $L_{eq}$  at the adjacent properties. Additionally, as shown in Table 5, noise levels would be below the most restrictive noise limit of 45 dB(A)  $L_{eq}$  for low-density residential uses at the nearest residential receivers. Therefore, impacts related to on-site generated noise would be less than significant.

## 6.3 Traffic Noise

During operations, Project-generated traffic would increase volumes on local roadways and thereby increase traffic noise levels in the Project area. Project trip generation would be extremely limited—up to 40 trips per day. Ambient noise level increases attributable to Project-generated traffic are anticipated to be less than 3 dB(A) along all roadways. Therefore, impacts associated with traffic noise would be less than significant.

SINGLE POINT POWER (460 - 575V)	ALL	NFD	4	#4/0 AWG - 500 KCMIL

TEMPERATURE RELIEF DEVICES ARE LOCATED ON LIQUID LINES, AND ECONOMIZER ASSEMBLIES  
AND HAVE 1/4" AND 3/8" FLARE CONNECTION.  
PRESSURE RELIEF DEVICES ARE LOCATED ON THE EVAPORATOR (3/4" NPT MALE CONNECTOR) AND ON  
OIL SEPARATOR (3/8" FLARE CONNECTOR).  
DIMENSIONS SHOWN ARE IN INCHES, DIMENSIONS IN [ ] ARE IN MM.

### AquaForce™ Air-Cooled Variable Speed Screw Chiller

#### Unit Information

Tag Name:.....**30XV450**  
Model Number:.....**30XV450H**  
Quantity:.....**1**  
Manufacturing Source:.....**Charlotte, NC USA**  
ASHRAE 90.1:.....**2013/2016, 2010, 2007**  
Refrigerant:.....**R-134a**  
Independent Refrigerant Circuits:.....**2**  
Shipping Weight:.....**28780** lb  
Operating Weight:.....**29477** lb  
Refrigerant Weight (Circuit A):.....**456** lb  
Refrigerant Weight (Circuit B):.....**456** lb  
Unit Length:.....**594** in  
Unit Width:.....**88** in  
Unit Height:.....**99** in  
Required Pad Length:.....**564** in

#### Evaporator Information

Fluid Type:.....**Propylene Glycol**  
Brine Concentration:.....**30.00** %  
Fouling Factor:.....**0.000100** (hr-sqft-F)/BTU  
Leaving Temperature:.....**50.00** °F  
Entering Temperature:.....**60.00** °F  
Fluid Flow:.....**1,160.** gpm  
Pressure Drop:.....**29.7** ft H2O

#### Condenser Information

Altitude:.....**0.000** ft  
Number of Fans:.....**24**  
Total Condenser Fan Air Flow:.....**315,400** CFM  
Entering Air Temperature:.....**95.0** °F

#### Integrated Pump Information

No Pump Selected

#### Performance Information

Cooling Capacity:.....**462.5** Tons  
Total Compressor Power:.....**486.0** kW  
Total Fan Motor Power:.....**32.67** kW  
Total Unit Power (without pump):.....**527.3** kW  
Efficiency (without pump) (EER):.....**10.52** BTU/Wh  
IPLV:..IP:.....**19.63** BTU/Wh

## Summary Performance Report For 30XV450

Project: Burns and McDonnell - AC Chillers 091418  
Prepared By:

10/12/2018  
02:11PM

### Accessories and Installed Options

Isolation Valve(s)  
Suction Line Insulation  
Control Transformer  
Non-Fused Disconnect  
Al Fin/Cu Tube  
Flooded Evaporator, 2 pass, with heater  
Low Sound Kit  
BACnet / Modbus Translator  
Coil Trim Panels  
Low Ambient Head Pressure Control  
High Tier

### Electrical Information

Unit Voltage:.....**460-3-60** V-Ph-Hz  
Connection Type:.....**Single Point**  
Minimum Voltage:.....**414** Volts  
Maximum Voltage:.....**506** Volts

Amps	Electrical Circuit 1	Electrical Circuit 2
MCA	793.3	---
MOCP	1000.0	---
Rec Fuse Size	1000.0	---

Sound power measured in accordance with ANSI/AHRI Standard 370-2015.

Certified in accordance with the AHRI Air-Cooled Water-Chilling Packages Certification Program, which is based on AHRI Standard 550/590 (I-P) and AHRI Standard 551/591 (SI). Certified units may be found in the AHRI Directory at [www.ahridirectory.org](http://www.ahridirectory.org). Unit contains freeze protection fluids in the evaporator with a leaving chilled fluid temperature above 32°F [0°C] is certified when rated per the Standard with water.

# Summary Performance Report For 30XV450

## Unit Parameters

Tag Name: 30XV450  
Model Number: 30XV450H  
Condenser Type: Air Cooled  
Compressor Type: VFD Screw  
Chiller Nameplate Voltage: 460-3-60 V-Ph-Hz  
Quantity: 1  
Manufacturing Source: Charlotte, NC USA  
Refrigerant: R-134a  
Shipping Weight: 28780 lb  
Operating Weight: 29477 lb  
Refrigerant Weight (Circuit A): 456 lb  
Refrigerant Weight (Circuit B): 456 lb  
Unit Length: 594 in  
Unit Width: 88 in  
Unit Height: 99 in

1 - Chiller Height Above Ground  
2 - Horizontal Distance From Chiller to Receiver  
3 - Receiver Height Above Ground  
(See Note 3)

## Accessories and Installed Options

Isolation Valve(s)  
Suction Line Insulation  
Control Transformer  
Non-Fused Disconnect  
Al Fin/Cu Tube  
Flooded Evaporator, 2 pass, with heater  
Low Sound Kit  
BACnet / Modbus Translator  
Coil Trim Panels

## Acoustic Information

Table 1. A-Weighted Sound Power Levels (dB re 1 picowatt). See note #1.

Octave Band Center Frequency, Hz	63	125	250	500	1k	2k	4k	8k	Overall
100% Load	71	83	87	97	101	101	99	87	106
75% Load	68	79	85	97	93	94	87	82	100
50% Load	62	71	85	86	89	86	78	79	93
25% Load	59	67	83	83	86	84	76	76	91

Table 2. A-Weighted Sound Pressure Levels (dB re 20 micropascals) calculated based upon user defined input for dimensions 1, 2 and 3 as shown in above diagram. See note #2 and #3.

Octave Band Center Frequency, Hz	63	125	250	500	1k	2k	4k	8k	Overall
100% Load	37	49	53	63	67	67	65	53	72
75% Load	34	45	52	63	59	60	54	48	66
50% Load	28	37	51	52	55	52	45	45	59
25% Load	25	33	49	50	52	50	42	42	57

Notes: (1) Measurements performed in accordance with AHRI Standard 370-2015 for air cooled Chillers.

(2) Chiller is assumed to be a point source on a reflecting plane.

(3) Without user defined input, the default dimensions used to construct Table 2 are as follows:

- 1 - Chiller Height Above Ground = 0.0 ft
- 2 - Horizontal Distance From Chiller to Receiver = 30.0 ft
- 3 - Receiver Height Above Ground = 3.0 ft

## Detailed Performance Summary For 30XV450

## Notice of Availability of Draft Environmental Impact Report for the Westside Canal Battery Energy Storage Project

---

Stantec Consulting Services Inc. has prepared a Draft Environmental Impact Report (EIR) for the Westside Canal Battery Energy Storage Project (Project) on behalf of the Imperial County Planning and Development Services described below. The Imperial County Planning and Development Services Department held a public scoping meeting for the Project was held on May 28, 2020 at 1:30PM at the Imperial County Board of Supervisors Chambers, 2<sup>nd</sup> Floor of the County Administration Center located at 940 Main Street, El Centro, CA 92243.

**REFERENCE:** Westside Canal Battery Energy Storage Project

**PROJECT LOCATION:** Consolidated Edison Development Inc. (CED) is proposing to develop the Westside Canal Battery Energy Storage Project, a utility-scale energy storage complex with the capacity of up 2,000 megawatts (MW) at full build out in Imperial County, California. The Project would be located on approximately 163 acres of land in the unincorporated Mount Signal area of the County, approximately eight miles southwest of the City of El Centro and approximately 5 miles north of the U.S.-Mexico border.

**PROJECT DESCRIPTION:** The Project would be comprised of lithium-ion and/or flow battery energy storage system facilities, a behind-the-meter solar energy facility, a new on-site 230 kilovolt (kV) loop-in switching station, a 34.5 kV to 230 kV Project substation, underground electrical cables, and permanent vehicular access to and from the Project Site over a proposed clear-span bridge spanning IID's Westside Main Canal. The proposed loop-in switching station would connect the Project to the existing IID Campo Verde-Imperial Valley 230 kV radial gen-tie line, which connects to the Imperial Valley (IV) Substation and the California Independent System Operator (CAISO), approximately one-third mile south of the Project Site. CED has submitted the necessary Interconnection Request Applications to the California Independent System Operator (CAISO) and Imperial Irrigation District (IID). The Project compliments both the existing operational renewable energy facilities, and those planned for future development in the County, and supports the broader Southern California's bulk electric transmission system by serving as a firm, dispatchable resource.

**DESIGNATED AREA PLAN:** The Project area is designated as Agriculture by the Imperial County General Plan. The Project site and immediate adjacent parcels are zoned as A-3.

**BOARD OF SUPERVISORS DISTRICT:** District 2, Supervisor Luis A. Plancarte

**ANTICIPATED SIGNIFICANT EFFECTS:** The Draft EIR analyzed potential impacts associated with the following: Aesthetics; Agriculture; Air Quality; Biological Resources; Geology and Soils; Greenhouse Gas Emissions; Hazards and Hazardous Materials; Hydrology and Water Quality; Land Use and Planning; Tribal Cultural Resources; Utilities and Service Systems; and Cumulative Impacts.

**COMMENTS REQUESTED:** Your comments may be submitted in writing to David Black, Senior Planner, located at 801 Main Street, El Centro, CA 92243. A hard copy of the Draft EIR is available for review at the Imperial County Planning and Development Services Department located at 801 Main Street, El Centro, CA 92243 from 7:00 am thru 5:00 pm Monday thru Friday.

**DRAFT EIR REVIEW PERIOD:** April 7, 2021 to May 27, 2021. Copies of the Draft EIR will be available for review at the local libraries and the Imperial County Planning and Development Services Department will post the Draft EIR on the Imperial County Website ([www.icpds.com](http://www.icpds.com)).

**Notice of Completion & Environmental Document Transmittal**

**Present Land Use/Zoning/General Plan Designation:**

Agricultural (A-3); adjacent parcels are designated as Recreation/Open Space

**Project Description:** (please use a separate page if necessary)

Consolidated Edison Development (CED) Westside Canal Battery Storage, LLC (Applicant), is proposing to develop, design, construct, own, operate, and maintain, and eventually decommission the CED Westside Canal Battery Storage Project (Project), a utility-scale energy storage complex with the capacity of up to 2,000 Megawatts (MW) at full build-out. The proposed Project would store energy generated from the electrical grid, and optimally discharge that energy back into the grid as a firm, dispatchable resource. The Project Site is located on approximately 163 acres of land, 148 of which are owned by the Applicant, and the remaining land is owned by the Bureau of Land Management (BLM), IID, and a private landowner. The proposed Project would be constructed in 3 to 5 multiple phases over a 10-year period with each phase ranging from approximately 25 MW to 400 MW. Given the approximately 10-year development of the Project, the expected end date of the Project life cycle would be 30 years from the construction of the final phase, or no more than 40 years after the effective date of the Conditional Use Permit.

The Project would be comprised of lithium-ion and/or flow battery energy storage system facilities, a behind-the-meter solar energy facility, a new on-site 230 kilovolt (kV) loop-in switching station, a 34.5 kV to 230 kV Project substation, underground electrical cables, and permanent vehicular access to and from the Project Site over a proposed clear-span bridge spanning IID's Westside Main Canal. The proposed loop-in switching station would connect the Project to the existing IID Campo Verde-Imperial Valley 230 kV radial gen-tie line, which connects to the Imperial Valley (IV) Substation and the California Independent System Operator (CAISO), approximately one-third mile south of the Project Site. CED has submitted the necessary Interconnection Request Applications to the CAISO and IID.

The Project complements both the existing operational renewable energy facilities, and those planned for future development in the County, and supports the broader Southern California's bulk electric transmission system by serving as a firm, dispatchable resource.

Note: The State Clearinghouse will assign identification numbers for all new projects. If a SCH number already exists for a project (e.g. Notice of Preparation or previous draft document) please fill in.

## Reviewing Agencies Checklist

Lead Agencies may recommend State Clearinghouse distribution by marking agencies below with an "X".  
If you have already sent your document to the agency please denote that with an "S".

## **RESOLUTION NO.**

### **A RESOLUTION OF THE IMPERIAL COUNTY PLANNING COMMISSION FOR APPROVAL OF THE MITIGATION MONITORING AND REPORTING PROGRAM FOR THE WESTSIDE CANAL BATTERY ENERGY STORAGE PROJECT**

**WHEREAS**, a Mitigation Monitoring and Reporting Program (MM&RP) has been prepared in accordance with the requirements of the California Environmental Quality Act, the State CEQA Guidelines, and the County's "Rules and Regulations to Implement CEQA as Amended"; and

**WHEREAS**, the Planning Commission of the County of Imperial has the authority to approve the MM&RP; and

**WHEREAS**, public notice of said application has been given, and the Planning Commission has considered evidence presented by the Planning & Development Services Department and other interested parties at a public hearing held with respect to this item on October 13, 2021.

**NOW THEREFORE**, the Planning Commission of the County of Imperial **DOES HEREBY RESOLVE** as follows:

**SECTION 1.** The Planning Commission has considered the proposed Mitigation Monitoring and Reporting Program (MM&RP) prior to making a decision on the project. The Planning Commission finds and determines that the Environmental Impact Report is adequate and prepared in accordance with the requirements of the California Environmental Quality Act (CEQA), which analyzes environmental effects, based upon the following findings and determinations.

**SECTION 2.** That in accordance with State Planning and Zoning law and the County of Imperial regulations, the following findings for the approval and certification of the Final EIR, MM&RP and Findings of Fact have been made as follows:

1. That the Final Project EIR SCH#2020040122, Candidate CEQA Findings for the above projects have been prepared in accordance with the requirements of the California Environmental Quality Act, the State CEQA Guidelines, and the County's "Rules and Regulations to Implement CEQA as Amended".

2. That the County has reviewed, analyzed, and considered Final EIR, the environmental impacts therein identified for this Project, the Candidate CEQA Findings, and the Mitigation Monitoring and Reporting Program and the entire Record of Proceedings prior to approving this project.

**PLANNING COMMISSION RESOLUTION FOR  
MMRP**

**Page 2 of 3**

3. That the Final EIR and the Candidate CEQA Findings reflect the independent judgment of the County.
4. That the Candidate CEQA Findings are supported by substantial evidence and backed by information provided to the County by experts, including but not limited to the County staff and the EIR preparer, on whom the County relies.
5. That the County accept as its own, incorporate as if set forth in full herein, and make each and every one of the findings contained in the Candidate CEQA Findings, including feasibility of mitigation measures pursuant to Public Resources Code 21081(a)/CEQA Guidelines 15091.
6. That the Mitigation Monitoring and Reporting Program is designed to ensure that during project implementation, the Developer and any other responsible parties shall implement the Project components and comply with feasible mitigation measures identified in the CEQA Findings, the Project entitlements, and the Mitigation Monitoring and Reporting Program and that these measures are fully enforceable through permit conditions, agreements, and/or other measures, such as their inclusion in the Mitigation Monitoring and Reporting Program.
7. That the Project will not individually or cumulative have an adverse effect on fish and wildlife resources, as defined in Section 711.2 of the Fish and Game Code.
8. That the Record of Proceedings consists of the Final EIR (and all its technical reports and addendums thereto); the County staff reports; the CEQA Findings; the Mitigation Monitoring and Reporting Program; the various Project entitlements and documents referenced therein; all final reports, applications, memoranda, maps, letters, and other planning documents prepared by the EIR planning/environmental consultant; all final reports, memoranda, maps, letters, and other planning documents prepared by the County staff; all documents submitted by members of the public and public agencies in connection with the Final EIR; minutes and transcripts of all public meetings and public hearings; all written and verbal public testimony presented during a noticed public hearing for the proposed project which such testimony was taken and any and all other materials which constitute the record of proceeding pursuant to Public Resources Code section 21167.6(e); and matters of common knowledge to the County staff and Planning Commission, including, but not limited to the County General Plan, the County Land Use Ordinance, County policies, which may be found during regular business hours, and the Imperial County Planning & Development Services Department at 801 Main Street, El Centro, CA 92243.
9. That the County does hereby certify the Final EIR, approve the Findings and the MM&RP.

**PLANNING COMMISSION RESOLUTION FOR  
MMRP**

**Page 3 of 3**

**NOW, THEREFORE**, based on the above findings, the Planning Commission of the County of Imperial **DOES HEREBY CERTIFY** the proposed Mitigation Monitoring and Reporting Program for the Final EIR (SCH#2020040122), the Candidate CEQA Findings, and the above project.

---

**Rudy Schaffner, Chairperson**  
Imperial County Planning Commission

I hereby certify that the preceding resolution was taken by the Planning Commission at a meeting conducted on October 13, 2021 by the following vote:

**AYES:**

**NOES:**

**ABSENT:**

**ABSTAIN:**

**ATTEST:**

---

James A. Minnick, Director of Planning & Development Services  
Secretary to the Planning Commission

## **Appendix A      MITIGATION MONITORING AND REPORTING PROGRAM**

## MITIGATION MONITORING AND REPORTING PROGRAM

Mitigation Measure	Required Time of Compliance	Responsible Implementing Party	Responsible Monitoring Party	Status of Implementation
<b>AGRICULTURAL AND FORESTRY RESOURCES</b>				
<p><b>AG-1: Payment of Agricultural and Other Benefit Fees</b> One of the following options included below is to be implemented prior to the issuance of a grading permit or building permit for the Project:</p> <p><b>Mitigation for Non-Prime Farmland</b> <b>Option 1:</b> Provide Agricultural Conservation Easement(s). The Permittee shall procure Agricultural Conservation Easements on a "1 on 1" basis on land of equal size, of equal quality farmland, outside the path of development. The conservation easement shall meet Department of Conservation regulations and shall be recorded prior to issuance of any grading or building permits; or</p> <p><b>Option 2:</b> Pay Agricultural In-Lieu Mitigation Fee. The Permittee shall pay an "Agricultural In-Lieu Mitigation Fee" in the amount of 20 percent of the fair market value per acre for the total acres of the proposed site based on five comparable sales of land used for agricultural purposes as of the effective date of the permit, including program costs on a cost recovery/time and material basis. The Agricultural In-Lieu Mitigation Fee, will be placed in a trust account administered by the Imperial County Agricultural Commissioner's office and will be used for such purposes as the acquisition, stewardship, preservation, and enhancement of agricultural lands within Imperial County; or,</p> <p><b>Option 3:</b> Public Benefit Agreement. The Permittee and County shall voluntarily enter into an enforceable Public Benefit Agreement or Development Agreement that includes an Agricultural Benefit Fee payment that is 1) consistent with Board Resolution 2012-005; 2) the Agricultural Benefit Fee must be held by the County in a restricted account to be used by the County only for such purposes as the stewardship, preservation and enhancement of agricultural lands within Imperial County and to implement the goals and objectives of the Agricultural Benefit program, as specified in the Development Agreement, including addressing the mitigation of agricultural job loss on the local economy.</p>	Prior to Construction	Project Applicant	Imperial County	

Mitigation Measure	Required Time of Compliance	Responsible Implementing Party	Responsible Monitoring Party	Status of Implementation
<b>AIR QUALITY</b>				
<p><b>AIR-1: Regulation VIII (Fugitive Dust Control Measures)</b> All construction sites, regardless of size, must comply with the requirements contained within Regulation VIII.</p> <p><i>Standard Mitigation Measures for Fugitive Dust (PM10) Control</i></p> <ul style="list-style-type: none"> <li>a) All disturbed areas, including Bulk Material storage which is not being actively utilized, shall be effectively stabilized and visible emissions shall be limited to no greater than 20 percent opacity for dust emissions by using water, chemical stabilizers, dust suppressants, tarps, or other suitable material such as vegetative ground cover.</li> <li>b) All on-site and off-site unpaved roads would be effectively stabilized, and visible emissions shall be limited to no greater than 20 percent opacity for dust emissions by paving, chemical stabilizers, dust suppressants and/or watering.</li> <li>c) All unpaved traffic areas 1 acre or more with 75 or more average vehicle trips per day would be effectively stabilized and visible emission shall be limited to no greater than 20 percent opacity for dust emissions by paving, chemical stabilizers, dust suppressants and/or watering.</li> <li>d) The transport of Bulk Materials shall be completely covered unless 6 inches of freeboard space from the top of the container is maintained with no spillage and loss of Bulk Material. In addition, the cargo compartment of all Haul Trucks is to be cleaned and/or washed at delivery site after removal of Bulk Material.</li> <li>e) All Track-Out or Carry-Out would be cleaned at the end of each workday or immediately when mud or dirt extends a cumulative distance of 50 linear feet or more onto a paved road within an urban area.</li> <li>f) Movement of Bulk Material handling or transfer shall be stabilized prior to handling or at points of transfer with application of sufficient amounts of water, chemical stabilizers or by sheltering or enclosing the operation and transfer line.</li> <li>g) The construction of any new unpaved road is prohibited within any area with a population of 500 or more unless the road meets the definition of a temporary unpaved road. Any temporary unpaved road shall be effectively stabilized, and visible emissions shall be limited to no greater than 20 opacity for dust emission by paving, chemical stabilizers, dust suppressants and/or watering.</li> </ul>	During construction	Project Applicant, Construction Contractor	Imperial County	

Mitigation Measure	Required Time of Compliance	Responsible Implementing Party	Responsible Monitoring Party	Status of Implementation
<p><b>AIR-2: Construction Equipment Control Measures</b>  <b>Standard Mitigation Measures for Equipment Exhaust Emissions Control</b></p> <ul style="list-style-type: none"> <li>a) Use of equipment with alternative fueled or catalyst-equipped diesel engine, including for all off-road and portable diesel-powered equipment.</li> <li>b) Minimize idling time either by shutting equipment off when not in use or limit the idling time to a maximum of 5 minutes.</li> <li>c) Limit, to the extent feasible, the hours of operation of heavy-duty equipment and/or the number of equipment in use.</li> <li>d) Replace fossil fueled equipment with electrically driven equivalents (provided they are not run via a portable generator set).</li> </ul> <p><b>Required Mitigation Measures for Construction Equipment Mobilization</b></p> <ul style="list-style-type: none"> <li>a) The 1.2-mile portion of the access road from the IV Substation to the project site shall be covered with construction mats.</li> <li>b) No more than eight pieces of construction equipment shall be delivered to the project site in one day.</li> <li>c) A speed limit of 15 mph on the access road shall be enforced.</li> </ul> <p><b>Required Mitigation Measures for Construction Activities</b></p> <ul style="list-style-type: none"> <li>a) The 1.2-mile portion of the southern access road from the IV Substation to the project site shall be covered with construction mats.</li> <li>b) A material delivery speed limit of 15 mph on the access road shall be enforced.</li> <li>c) For material deliveries from the south, one of the following dust suppressant measures would be required for the 4.4-mile service road: <ul style="list-style-type: none"> <li>A water truck shall apply water every 3 hours, or as deliveries occur; or</li> </ul> </li> <li>d) A chemical dust suppressant shall be applied.</li> <li>e) For the 0.3-mile portion of the northern access route that is unpaved (south of Wixom Road to the worker parking area) one of the following dust suppressant measures would be required: <ul style="list-style-type: none"> <li>A water truck shall apply water every 3 hours, or as worker access occurs; or</li> <li>A chemical dust suppressant shall be applied.</li> <li>A water truck shall apply water to all active onsite grading areas every 3 hours.</li> </ul> </li> </ul> <p><b>Enhanced Mitigation Measures for Construction Equipment</b>  To help provide a greater degree of reduction of PM emissions from construction combustion equipment, ICAPCD recommends the following measures:</p>	During construction	Project Applicant, Construction Contractor	Imperial County, IAPCD	

Mitigation Measure	Required Time of Compliance	Responsible Implementing Party	Responsible Monitoring Party	Status of Implementation
<p>a) Curtail construction during periods of high ambient pollutant concentrations; this may include ceasing of construction activity during the peak hour of vehicular traffic on adjacent roadways.</p> <p>b) Implement activity management (e.g., rescheduling activities to reduce short-term impacts).</p>				
<p><b>AIR-3: Operational Dust Control Plan</b></p> <p>To help reduce fugitive dust emission from on-site unpaved roads and accumulation of small dunes during operations, an Operational Dust Control Plan (ODCP) would be prepared. The ODCP would include strategies for how dust emissions would be controlled and maintained during Project operations. The ODCP would be submitted to the ICAPCD for approval prior to the issuance of a Certificate of Occupancy.</p>	During operation	Project Applicant	Imperial County, IAPCD	
<b>BIOLOGICAL RESOURCES</b>				
<p><b>BR-1 Compensation for Permanent and Temporary Impacts to Vegetative Communities</b></p> <p>To compensate for permanent and temporary impacts to on-site vegetative communities, within the Project Site, habitat (which may include preservation areas within portions of the Project Site not impacted by construction or mitigation lands outside of the main Project Site) that contains the same quality of vegetative communities impacted by the Project and that is not already public land shall be preserved and managed in perpetuity at the following ratios – temporary impacts to native vegetation communities shall be mitigated at a 1:1 mitigation ratio (one acre preserved/restored for each acre impacted) and permanent impacts shall be mitigated at a ratio of 2:1. Impacts to CDFW listed sensitive or riparian communities shall be mitigated at a ratio of 3:1. Land acquired/dedicated for impacts to native vegetation communities must be with lands occupied by habitat of a similar type and quality.</p> <p>Prior to the disturbance of vegetation, the Applicant shall obtain County approval of preserved and/or mitigation lands as well as documentation of a recorded conservation easement. The compensation for the loss of habitats may be achieved either by a) on-site habitat creation or enhancement habitats with similar species composition to those present prior to construction, b) offsite creation or enhancement of, or c) participation in an established mitigation bank program. Prior to the removal of native vegetation, if on- or off-site mitigation is required, a Habitat Restoration Plan (HRP) shall be prepared that will guide all restoration and monitoring activities (refer to MM BR-2 for details on the plan requirements).</p>	Prior to Construction	Project Applicant	Imperial County	

<p><b>BR-2: Develop a Habitat Restoration Plan</b>  The Applicant shall restore temporarily disturbed areas to pre-construction conditions or better prior to the issuance of a grading permit and removal of any vegetation and/or wetland habitat. To this end, the Applicant shall retain a County qualified biologist, knowledgeable in the area(s) of annual grassland and wetland habitat restoration, to prepare a Habitat Restoration Plan (HRP). The Applicant shall submit the HRP to the County for approval (in consultation with CDFW and USFWS). The biologist will also be responsible for monitoring the implementation of the plan as well as the progress on achieving the established success criteria. The HRP shall expressly identify the process by which all disturbed areas shall be restored to pre-construction conditions or better. The plan will address restoration and revegetation related to disturbance from construction. It will also address restoration and revegetation required after decommissioning of the Project should this be required. The decommissioning plan shall include, at a minimum, the following items:</p> <ul style="list-style-type: none"> <li>a) Figures depicting areas proposed for temporary disturbance/mitigation lands – The HRP shall include detailed figures indicating the locations and vegetation types of areas proposed for temporary disturbance. These figures shall be updated, as necessary, to reflect current Site conditions should they change.</li> <li>b) Proposed species for restoration/revegetation – The species palette proposed for restoration/revegetation shall include a combination of native annual and perennial species known to currently occur on the Project site and in adjacent habitats.</li> <li>c) Seed source and collection guidelines – Seeds shall first be collected from the stock of native plants occurring on the proposed Project site, during the appropriate collection period (late spring through the summer, depending on the species) and prior to disturbance from construction activities. Additional seed may be collected from stock within a 25-mile radius will be collected to maintain local genetic integrity. If seed collection from these areas is not possible then a seed source must be obtained from a local seed supplier familiar with native species. Seed will be limited to the species and quantity specified in the seed mix palette prepared for the Project. All seed will originate from the Project region, within +/- 1000 feet elevation of the Project site. The seed supplier chosen will provide a list of three references with the bid proposal. The references will include year, contact names, and telephone numbers. Seeds will be tested for percent purity, percent germination, number of pure live seeds per pound, and weed seed content. Seed testing will be the responsibility of the seed supplier.</li> <li>d) Planting methodology – A description of the preferred methods proposed for container plant installation or seeding shall be provided (e.g., hydroseeding, drill seeding, broadcast seeding, etc.). Additionally, a</li> </ul>	Prior to Construction	Project Applicant	Imperial County, CDFW, USFWS	
--	-----------------------	-------------------	------------------------------	--

<p>discussion on timing of seeding, type of irrigation system proposed, potential need of irrigation, type and duration of irrigation, and erosion controls proposed for revegetation activities shall be included.</p> <p>e) Invasive, non-native vegetation Control – A comprehensive discussion on weed control for the Project site will be developed and included in the HRP. This will serve to prevent the type conversion of natural habitats to those dominated by invasive species known to occur in the area.</p> <p>f) Monitoring program – Areas subject to restoration/revegetation shall be monitored to assess conditions and to make recommendations for successful habitat establishment. Monitoring will be performed by a County qualified biologist(s), knowledge- able in the area of annual grassland habitat restoration. Monitoring should include, at a minimum, the following:</p> <ol style="list-style-type: none"> <li>1. Qualitative Monitoring – Qualitative monitoring surveys will be performed monthly in all restored/revegetated areas for the first year following planting in any phase of the Project. Qualitative monitoring will be on a quarterly schedule thereafter, until final completion approval of each restoration/revegetation area. Qualitative surveys will assess native plant species performance, including growth and survival, germination success, reproduction, plant fitness and health as well as pest or invasive plant problems. A County qualified wildlife biologist will assist in monitoring surveys and will actively search for mammal and other wildlife use. Monitoring at this stage will indicate need for remediation or maintenance work well in advance of final success/failure determination. The monitoring reports will describe site progress and conditions and list all observations pertinent to eventual success, and make recommendations as appropriate reg. remedial work, maintenance, etc.</li> <li>2. Quantitative Monitoring – Quantitative monitoring will occur annually for years one to five or until the success criteria are met. Within each revegetation area, as shown figures referenced above, the biologist will collect data in a series of 1 m2 quadrats to estimate cover and density of each plant species within the revegetated areas. Data will be used to measure native species growth performance, to estimate native and non-native species coverage, seed mix germination, native species recruitment and reproduction, and species diversity. Additionally, within wetland habitat restoration areas, the biologist shall conduct sampling events to document the presence of hydric soil characteristics/indicators (if present). Based on these results, the biologist will make recommendations for maintenance or remedial work on the site and for adjustments to the approved seed mix.</li> </ol>	
---	--

<p>a. Success criteria – Criteria for successful restoration/revegetation of disturbed areas shall be provided.</p> <p>b. Reporting – Reporting will include progress reports summarizing site status and recommended remedial measures that will be submitted by the biologist to the County quarterly, with the exception of the site visits immediately preceding the development of each annual status report (see below). Each progress report will list estimated species coverage and diversity, species health and overall vigor, the establishment of volunteer native species, topographical/soils conditions, problem weed species, the use of the site by wildlife species, significant drought stress, and any recommended remedial measures deemed necessary to ensure compliance with specified performance criteria. One annual site status report that summarizes site conditions will be forwarded by the biologist to the County, the USFWS and the CDFW at the end of each year following implementation of this plan until the established success criteria have been met. Each annual report will list species coverage and diversity measured during yearly quantitative surveys, compliance/non-compliance with required performance standards, species health and overall vigor, the establishment of volunteer native species, hydrological and topographical conditions, the use of the site by wildlife species, and the presence of invasive weed species. In the event of substantial noncompliance with the required performance criteria, the reports will include remedial measures deemed necessary to ensure future compliance with specified performance criteria. Each annual report will include, at the minimum:</p> <ul style="list-style-type: none"> <li>▪ The name, title, and company of all persons involved in restoration monitoring and report preparation</li> <li>▪ Maps or aerials showing restoration areas, transect locations, and photo documentation locations.</li> <li>▪ An explanation of the methods used to perform the work, including the number of acres treated for removal of non-native plants</li> <li>▪ An assessment of the treatment success.</li> </ul>				
---	--	--	--	--

Mitigation Measure	Required Time of Compliance	Responsible Implementing Party	Responsible Monitoring Party	Status of Implementation
<p><b>BR-3: Implement a Worker Environmental Education Program</b> Prior to any Project activities on the Site (i.e., surveying, mobilization, fencing, grading, or construction), a Worker Environmental Education Program (WEEP) shall be prepared and implemented by a qualified biologist(s). The WEEP shall be submitted to the County for review and approval prior to issuance of construction permits and implemented throughout the duration of the construction activities. The WEEP shall be put into action prior to the beginning of any Site related activities, including but not limited to those activities listed above, and implemented throughout the duration of Project construction. The WEEP, shall include, at a minimum, the following items:</p> <ul style="list-style-type: none"> <li>a) Training materials and briefings shall include, but not be limited to a discussion of the Federal and State Endangered Species Acts, BGEPA, and the MBTA; the consequences of non-compliance with these acts; identification and values of plant and wildlife species and significant natural plant community habitats; hazardous substance spill prevention and containment measures; a contact person and phone number in the event of the discovery of dead or injured wildlife; and a review of mitigation requirements.</li> <li>b) A discussion of measures to be implemented for avoidance of the sensitive resources discussed above and the identification of an on-site contact in the event of the discovery of sensitive species on the Site.</li> <li>c) Protocols to be followed when roadkill is encountered in the work area or along access roads to minimize potential for additional mortality of scavengers, including listed species such as the California condor and the identification of an on-site representative to whom the roadkill will be reported. Roadkill shall be reported to the appropriate local animal control agency within 24 hours.</li> <li>d) Maps showing the known locations of special status wildlife, populations of rare plants and sensitive vegetative communities, seasonal depressions and known waterbodies, wetland habitat, exclusion areas, and other construction limitations (e.g., limited operating periods, etc.). These features shall be included on the Project's plans and specifications drawings.</li> <li>e) Literature and photographs or illustrations of potentially occurring special-status plant and/or wildlife species will be provided to all Project contractors and heavy equipment operators.</li> <li>f) The Applicant shall provide to the County evidence that all on-site construction and security personnel have completed the WEEP prior to the start of Site mobilization. A special hardhat sticker or wallet size card shall be issued to all personnel completing the training, which shall be carried with the trained personnel at all times while on the Project Site. All</li> </ul>	Prior to and during Construction	Project Applicant, Construction Contractor	Imperial County	

Mitigation Measure	Required Time of Compliance	Responsible Implementing Party	Responsible Monitoring Party	Status of Implementation
<p>new personnel shall receive this training and may work in the field for no more than five days without participating in the WEEP. A log of all personnel who have completed the WEEP training shall be kept on Site.</p> <p>g) A weather protected bulletin board or binder shall be centrally placed or kept on-site (e.g., in the break room, construction foreman's vehicle, construction trailer, etc.) for the duration of the construction. This board or binder will provide key provisions of regulations or Project conditions as they relate to biological resources or as they apply to grading activities. This information shall be easily accessible for personnel in all active work areas.</p> <p>h) Develop a standalone version of the WEEP, that covers all previously discussed items above, and that can be used as a reference for maintenance personnel during Project operations.</p>				
<p><b>BR-4: Implementation of Best Management Practices</b></p> <p>BMPs will be implemented as standard operating procedures during all ground disturbance, construction, and operation related activities to avoid or minimize Project impacts on biological resources. These BMPs will include but are not limited to the following:</p> <p>a) Compliance with BMPs will be documented and provided to the County in a written report on an annual basis. The report shall include a summary of the construction activities completed, a review of the sensitive plants and wildlife encountered, a list of compliance actions and any remedial actions taken to correct the actions, and the status of ongoing mitigation efforts.</p> <p>b) Prior to ground disturbance of any kind the Project work areas shall be clearly delineated by stakes, flags, or other clearly identifiable system.</p> <p>c) Vehicles and equipment shall be parked on pavement, existing roads, and previously disturbed areas to the extent practicable.</p> <p>d) Speed limit signs, imposing a speed limit of 15 miles per hour, will be installed throughout the Project Site prior to initiation of Site disturbance and/or construction. To minimize disturbance of areas outside of the construction zone, all Project-related vehicle traffic shall be restricted to established roads, construction areas, and other designated areas. These areas will be included in preconstruction surveys and to the extent possible, should be established in locations disturbed by previous activities to prevent further impacts. Off-road traffic outside of designated Project areas will be prohibited.</p> <p>e) No vehicles or equipment shall be refueled within 100 feet of an ephemeral drainage or wetland unless a bermed and lined refueling area is constructed. Spill kits shall be maintained on-site in sufficient quantity to accommodate at least three complete vehicle tank failures of 50</p>	During Construction and operation	Project Applicant, Construction Contractor	Imperial County	

Mitigation Measure	Required Time of Compliance	Responsible Implementing Party	Responsible Monitoring Party	Status of Implementation
<p>gallons each. Any vehicles driven and/or operated within or adjacent to drainages or wetlands shall be checked and maintained daily to prevent leaks of materials.</p> <p>f) All general trash, food-related trash items (e.g., wrappers, cans, bottles, food scraps, cigarettes, etc.) and other human-generated debris will be stored in animal proof containers and/or removed from the Site each day. No deliberate feeding of wildlife will be allowed.</p> <p>g) All pipes and culverts with a diameter of greater than 4 inches shall be capped or taped closed. Prior to capping or taping the pipe/culvert shall be inspected for the presence of wildlife. If encountered the wildlife shall be allowed to escape unimpeded.</p> <p>h) No firearms will be allowed on the Project Site, unless otherwise approved for security personnel.</p> <p>i) To prevent harassment or mortality of listed, special-status species and common wildlife, or destruction of their habitats no domesticated animals of any kind shall be permitted in any Project area.</p> <p>j) Use of chemicals, fuels, lubricants, or biocides will comply with all local, state, and federal regulations. All uses of such compounds shall observe label and other restrictions mandated by the U.S. EPA, California Department of Food and Agriculture, and other state and federal legislation, as well as additional Project-related restrictions deemed necessary by the USFWS and CDFW. Use of rodenticides is restricted.</p> <p>k) Any contractor or employee that inadvertently kills or injures a special-status animal, or finds one either dead, injured, or entrapped, will immediately report the incident to the on-site representative identified in the WEEP. The representative will contact the USFWS, CDFW, and County by telephone by the end of the day, or at the beginning of the next working day if the agency office is closed. In addition, formal notification shall be provided in writing within three working days of the incident or finding. Notification will include the date, time, location, and circumstances of the incident. Any threatened or endangered species found dead or injured will be turned over immediately to CDFW for care, analysis, or disposition.</p> <p>l) During the Site disturbance and/or construction phase, grading and construction activities before dawn and after dusk, is prohibited.</p> <p>m) Avoidance and minimization of vegetation removal within active construction areas, including the flagging of sensitive vegetative communities or plants.</p> <p>n) Avoidance and minimization of construction activities resulting in impacts to wetlands, streambeds, and banks of any ephemeral drainage unless permitted to do so.</p> <p>o) All excavation, steep-walled holes, or trenches in excess of 6 inches in</p>				

Mitigation Measure	Required Time of Compliance	Responsible Implementing Party	Responsible Monitoring Party	Status of Implementation
<p>depth will be covered at the close of each working day by plywood or similar materials or provided with one or more escape ramps constructed of earth dirt fill or wooden planks. Trenches will also be inspected for entrapped wildlife each morning prior to onset of construction activities and immediately prior to covering with plywood at the end of each working day. Before such holes or trenches are filled, they will be thoroughly inspected for entrapped wildlife. Any wildlife discovered will be allowed to escape before construction activities are allowed to resume or removed from the trench or hole by a qualified biologist holding the appropriate permits (if required).</p> <p>p) New light sources will be minimized, and lighting will be designed (e.g., using down- cast lights) to limit the lighted area to the minimum necessary.</p>				
<p><b>BR-5: Wildlife Pre-Construction Surveys and Biological Monitoring</b> Prior to ground disturbance or vegetation clearing within the Project Site, a qualified biologist shall conduct surveys for wildlife (no more than 72 hours prior to Site disturbing activities) where suitable habitat is present and directly impacted by construction activities. Wildlife found within the Project Site or in areas potentially affected by the Project will be relocated to the nearest suitable habitat that will not be affected by the Project prior to the start of construction. Special-status species found within a Project impact area shall be relocated by an authorized biologist to suitable habitat outside the impact area.</p>	Prior to Construction	Project Applicant	Imperial County	
<p><b>BR-6: Implement Biological Construction Monitoring</b> Prior to the commencement of ground disturbance or Site mobilization activities the Applicant shall retain a qualified biologist(s), for the duration of Project construction, with demonstrated expertise with listed and/or special-status plants, terrestrial mammals, and reptiles to monitor(s), on a daily basis, all construction activities. The qualified biologist(s) shall be present at all times during ground disturbing activities immediately adjacent to, or within, habitat that supports populations of the listed or special status species identified within the Project boundaries. Any listed or special-status plants shall be flagged for avoidance. Any special-status terrestrial species found within a Project impact area shall be relocated by the authorized biologist and relocated to suitable habitat outside the impact area. If the installation of exclusion fencing is deemed necessary by the authorized biologist, the authorized biologist shall direct the installation of the fence. Clearance surveys for special-status species shall be conducted by the authorized biologist prior to the initiation of construction each day.</p>	Prior to Construction	Project Applicant	Imperial County	

Mitigation Measure	Required Time of Compliance	Responsible Implementing Party	Responsible Monitoring Party	Status of Implementation
<p>If the biological monitor observes a dead or injured listed or special-status wildlife species on the construction Site during construction, a written report shall be sent to the County, CDFW and/or USFWS within five calendar days. The report will include the date, time of the finding or incident (if known), and location of the carcass and circumstances of its death (if known). The biological monitor shall, immediately upon finding the remains, coordinate with the on-site construction foreman to discuss the events that caused the mortality (if known) and implement measures to prevent future incidents. Details of these measures shall be included with the report. Species remains shall be collected and frozen as soon as possible, and CDFW and/or USFWS shall be contacted regarding ultimate disposal of the remains.</p>				
<p><b>BR-7: Conduct Pre-Construction Surveys for Nesting and Breeding Birds and Implementation of Avoidance Measures</b></p> <p>Prior to any Site disturbance (i.e., mobilization, staging, grading or construction), the Applicant shall retain a qualified biologist(s) to conduct pre-construction surveys for nesting birds within the recognized breeding season (generally February 15 – September 15 but may start earlier for some raptor species) in all areas within 500 feet of Project components (staging areas, substation sites, battery facility structures including, solar arrays, and access road locations). The initial survey event must be completed no more than three days prior to vegetation removal or ground disturbing activities. The required survey dates may be modified based on local conditions, as determined by the qualified biologist(s), with the approval of the County, in consultation with the USFWS and/or CDFW. Measures intended to exclude nesting birds shall not be implemented without prior approval by the County in consultation with USFWS and/or CDFW and shall not exceed County noise standards.</p> <p>If breeding birds with active nests are found prior to or during construction, a biological monitor shall establish a 300-foot buffer around the nest for ground-based construction activities and no activities will be allowed within the buffer(s) until the young have fledged from the nest or the nest fails.</p> <p>The prescribed buffers may be adjusted to reflect existing conditions including ambient noise, topography, and disturbance with the approval of the County, CDFW and USFWS as appropriate. The biological monitor(s) shall conduct regular monitoring of the nest to determine success/failure and to help ensure that Project activities are not conducted within the buffer(s) until the nesting cycle is complete or the nest fails. The biological monitor(s) shall be responsible for documenting the results of the surveys and ongoing monitoring and will provide a copy of the monitoring reports for impact areas to the respective agencies.</p>	<p>Prior to and during Construction</p>	<p>Project Applicant, Construction Contractor</p>	<p>Imperial County, CDFW, USFWS</p>	

Mitigation Measure	Required Time of Compliance	Responsible Implementing Party	Responsible Monitoring Party	Status of Implementation
<p>If for any reason a bird nest must be removed during the nesting season, the Applicant shall provide written documentation providing concurrence from the USFWS and CDFW authorizing the nest relocation. Additionally, the Applicant shall provide a written report documenting the relocation efforts. The report shall include what actions were taken to avoid moving the nest, the location of the nest, what species is being relocated, the number and condition of the eggs taken from the nest, the location of where the eggs are incubated, the survival rate, the location of the nests where the chicks are relocated, and whether the birds were accepted by the adopted parent.</p> <p>Surveys shall be conducted to include all structural components, related structures, as well as all construction equipment. If birds are found to be nesting in facility structures, buffers as described above shall be implemented. If birds are found to be nesting in construction equipment, that equipment shall not be used until the young have fledged the nest or, if no young are present, until after the breeding season has passed.</p> <p>If trees are to be removed as part of Project-related construction activities, they will be done so outside of the nesting season to avoid additional impacts to nesting raptors. If removal during the nesting season cannot be avoided, the biological monitor must confirm that the nest is vacant prior to its removal. If nests are found within these structures and contain eggs or young, the biological monitor shall allow no activities within a 300-foot buffer for nesting birds and/or a 500-foot buffer for raptors until the young have fledged the nest.</p>				
<p><b>BR-8: Implement Avian Power Line Interaction Committee guidelines</b>  The Applicant will be required to construct all transmission facilities, towers, poles, and lines in accordance with and comply with all policies set forth in the Suggested Practices for Raptor Protection on Power Lines: The State of the Art in 2006 and Reducing Avian Collisions with Power Lines: The State of the Art in 2012 (APLIC), to minimize avian electrocutions as a result of the construction of the Project. Details of design components shall be indicated on all construction plans and measures to comply with Avian Power Line Interaction Committee (APLIC) policies and guidelines shall be detailed in a separate attachment, all of which will be submitted with the construction permit application. The Applicant shall be required to monitor for new versions of the APLIC guidelines and update designs or implement new measures as needed during Project construction, provided these actions do not require the purchase of previously ordered transmission line structures. A review of compliance with submitted materials will be conducted prior to the final County inspection.</p>	Prior to and during Construction	Project Applicant	Imperial County, APLIC	

Mitigation Measure	Required Time of Compliance	Responsible Implementing Party	Responsible Monitoring Party	Status of Implementation
<p><b>BR-9: Conduct Pre-Construction Surveys for State and Federally Threatened, Endangered, Proposed, Petitioned, and Candidate Plants and Implementation of Avoidance Measures</b></p> <p>Prior to initial ground disturbance and for undisturbed areas in subsequent construction years, the Applicant shall conduct pre-construction surveys for State and federally listed Threatened and Endangered, Proposed, Petitioned, and Candidate plants in all areas subject to ground-disturbing activity, including, but not limited to, battery facility structures including, access roads, poles/towers, solar array footing preparation, construction areas, and assembly yards. The surveys shall be conducted during the appropriate blooming period(s) by a qualified plant ecologist/biologist according to protocols established by the USFWS, CDFW, and CNPS. All listed plant species found shall be marked and avoided. Any populations of special-status plants found during surveys will be fully described, mapped, and a CNPS Field Survey Form or written equivalent shall be prepared.</p> <p>These surveys must be accomplished during a year in which rainfall totals are at least 80 percent of average and in which the temporal distribution of rainfall is not highly abnormal (e.g., with most rainfall occurring very early or late in the season) to be reasonably certain of the presence/absence of rare plant species, unless surveys of reference populations document that precipitation conditions would not have adversely affected the ability to detect the species. This condition may be waived with the approval of the County after consultation with the CDFW and USFWS. If a listed plant species cannot be avoided, consultation with USFWS and CDFW will occur.</p> <p>Prior to Site grading or vegetation removal, any populations of listed plant species identified during the surveys within the Project limits and beyond, shall be protected and a buffer zone placed around each population. The buffer zone shall be established around these areas and shall be of sufficient size to eliminate potential disturbance to the plants from human activity and any other potential sources of disturbance including human trampling, erosion, and dust. The size of the buffer depends upon the proposed use of the immediately adjacent lands and includes consideration of the plant's ecological requirements (e.g., sunlight, moisture, shade tolerance, physical and chemical characteristics of soils) that are identified by a qualified plant ecologist and/or botanist. The buffer for herbaceous and shrub species shall be, at minimum, 50 feet from the perimeter of the population or the individual. A smaller buffer may be established, provided there are adequate measures in place to avoid the take of the species, with the approval of the USFWS, CDFW, and County.</p>	Prior to Construction	Project Applicant, Construction Contractor	Imperial County, CDFW, USFWS, CNPS	

Mitigation Measure	Required Time of Compliance	Responsible Implementing Party	Responsible Monitoring Party	Status of Implementation
Where impacts to listed plants are determined to be unavoidable, the USFWS and/or CDFW shall be consulted for authorization. Should any CESA-listed plant species be detected, an incidental take permit would need to be obtained. Additional mitigation measures to protect or restore listed plant species or their habitat, including but not limited to a salvage plan including seed collection and replanting, may be required by the USFWS or CDFW before impacts are authorized, whichever is appropriate.				
<p><b>BR-10: Compensate for Impacts to State and Federally Threatened, Endangered, Proposed, Petitioned, and Candidate Plants</b></p> <p>To compensate for permanent impacts to State and Federally Threatened, Endangered, Proposed, Petitioned and Candidate plants, habitat (which may include preservation areas within the undisturbed areas of the Project footprint, mitigation lands outside of the main Project Site or a combination of both) that is not already public land shall be preserved and managed in perpetuity at a 1:1 mitigation ratio (one acre preserved for each acre impacted). Prior to the disturbance of habitat for or take of listed plant species the Applicant will be required to obtain County approval of preserved and/or mitigation lands as well as provide documentation of a recorded conservation easement(s). Compensation for temporary impacts shall include land acquisition and/or preservation at a 0.5:1 ratio. The preserved habitat for a significantly impacted plant species shall be of equal or greater habitat quality to the impacted areas in terms of soil features, extent of disturbance, vegetation structure, and will contain verified extant populations, of the same size or greater, of the State or Federally listed plants that are impacted.</p> <p>Habitat shall be preserved through the use of permanent open space easements. Mitigation lands cannot be located on land that is currently held publicly. Mitigation lands may include (depending on the habitat requirements of particular species):</p> <ul style="list-style-type: none"> <li>• Areas outside the Project boundary, but within the general Project region</li> <li>• Preservation areas within portions of the Project Site that are at least 100 feet from Project components and are either (1) not permanently impacted by construction and operation of the Project, or (2) temporarily disturbed and then restored according to the requirements in Mitigation Measure BR-2; and</li> <li>• Degraded areas (e.g., areas that have been actively dry-farmed) that are restored to high quality habitat through the implementation of a County-approved restoration plan.</li> </ul> <p>Criteria for appropriate mitigation land are species specific; the following factors must be considered in assessing the quality of potential mitigation habitat: (1)</p>	Prior to and during construction	Project Applicant	Imperial County, CDFW, USFWS	

Mitigation Measure	Required Time of Compliance	Responsible Implementing Party	Responsible Monitoring Party	Status of Implementation
<p>Current land use; (2) Location (e.g., habitat corridor, part of a large block of existing habitat, adjacency to source populations, proximity to Project facilities or other potential sources of disturbance); (3) Vegetation composition and structure; (4) Slope; (5) Soil composition and drainage; and (6) Level of occupancy or use by relevant species.</p> <p>The Applicant shall either provide open space easements or provide funds for the acquisition of such easements to a "qualified easement holder" (defined below). The CDFW is a qualified easement holder. To qualify as a "qualified easement holder" a private land trust must have the following:</p> <ul style="list-style-type: none"> <li>• Substantial experience managing open space easements that are created to meet mitigation requirements for impacts to sensitive species</li> <li>• Adopted the Land Trust Alliance's Standards and Practices</li> <li>• A stewardship endowment fund to pay for its perpetual stewardship obligations</li> </ul> <p>The County shall determine whether a proposed easement holder meets these requirements.</p> <p>The Applicant shall also be responsible for donating to the conservation easement holder fees sufficient to cover: (1) Administrative costs incurred in the creation of the conservation easement (appraisal, documenting baseline conditions, etc.) and (2) Funds in the form of a non-wasting endowment to cover the cost of monitoring and enforcing the terms of the conservation easement in perpetuity. The amount of these administrative and stewardship fees shall be determined by the conservation easement holder in consultation with the County.</p> <p>Open space easement(s) shall also be subject to the following conditions:</p> <ul style="list-style-type: none"> <li>• The locations of acceptable easement(s) shall be developed with approval of CDFW and USFWS.</li> <li>• The primary purpose of the easement(s) shall be conservation of impacted species and habitats, but the conservation easement(s) shall also allow livestock grazing when and where it is deemed beneficial for the habitat needs of impacted species.</li> </ul> <p>Open space easement(s) shall:</p> <ul style="list-style-type: none"> <li>• Be held in perpetuity by a qualified easement holder (defined above).</li> <li>• Be subject to a legally binding agreement that shall: (1) Be recorded with the County Recorder(s); and (2) Name CDFW or another organization to which the easement(s) will be conveyed if the original holder is dissolved.</li> <li>• Be subject to the management requirements outlined in Mitigation</li> </ul>				

Mitigation Measure	Required Time of Compliance	Responsible Implementing Party	Responsible Monitoring Party	Status of Implementation
<p>Measure BR-2.</p> <p>However, if lands acquired or protected for the compensation of permanent impacts to wildlife and/or vegetative communities (discussed above) contain similar sized populations of the impacted listed plant species, no further mitigation would be required.</p>				
<p><b>BR-11: Conduct Pre-Construction Surveys for Special-Status Plants and Implement Avoidance Measures</b></p> <p>Prior to initial ground disturbance and for undisturbed areas in subsequent construction years, the Applicant shall conduct pre-construction surveys for special-status plant species in all areas subject to ground-disturbing activity, including, but not limited to, battery facility structures including, access roads, poles/towers, construction areas, and assembly yards. The surveys shall be conducted during the appropriate blooming period(s) by a qualified plant ecologist/biologist according to protocols established by the USFWS, CDFW, and CNPS. All listed plant species found shall be marked and avoided. Any populations of special-status plants found during surveys will be fully described, mapped, and a CNPS Field Survey Form or written equivalent shall be prepared. These surveys must be accomplished during a year in which rainfall totals are at least 80 percent of average and in which the temporal distribution of rainfall is not highly abnormal (e.g., with most of the rainfall occurring very early or late in the season) to be reasonably certain of the presence/absence of rare plant species, unless surveys of reference populations document that precipitation conditions would not have adversely affected the detectability of the species.</p> <p>Prior to Site grading, any populations of special-status plant species identified during the surveys shall be protected by a buffer zone. The buffer zone shall be established around these areas and shall be of sufficient size to eliminate potential disturbance to the plants from human activity and any other potential sources of disturbance including human trampling, erosion, and dust. The size of the buffer depends upon the proposed use of the immediately adjacent lands and includes consideration of the plant's ecological requirements (e.g., sunlight, moisture, shade tolerance, physical and chemical characteristics of soils) that are identified by a qualified plant ecologist and/or botanist. The buffer for herbaceous and shrub species shall be, at minimum, 50 feet from the perimeter of the population or the individual. A smaller buffer may be established, provided there are adequate measures in place to avoid the take of the species, with the approval of the USFWS, CDFW, and County. Highly visible flagging shall be placed along the buffer area and remain in good working order during the duration of any construction activities in the area. If Project related impacts result in the loss of more than 10 percent of the on-site population of any Special-Status plant</p>	<p>Prior to Construction</p>	<p>Project Applicant, Construction Contractor</p>	<p>Imperial County, CDFW, USFWS, CNPS</p>	

Mitigation Measure	Required Time of Compliance	Responsible Implementing Party	Responsible Monitoring Party	Status of Implementation
<p>species, compensatory mitigation will be required as described below.</p> <p><b>BR-12: Compensate for Impacts to Special-Status Plant Species</b>            If Project related impacts result in the loss of more than 10 percent of the on-site population of any Special-Status plant species, compensatory mitigation will be required. Prior to the disturbance of habitat for or take of Special Status plants/populations the Applicant must receive County approval of preserved and/or mitigation lands as well as present documentation of a recorded conservation easement(s). Compensation will be required for all impacts that exceed the 10 percent threshold (e.g., impacts to 15 percent of a population will only require compensation for 5 percent or the amount of impacts that exceed the 10 percent threshold). To compensate for permanent impacts to special-status plant species, habitat (which may include preservation of areas within the undisturbed areas of the Project footprint, mitigation lands outside of the main Project Site or a combination of both) that is not already public land shall be preserved and managed in perpetuity at a 1:1 mitigation ratio (one acre preserved for each acre impacted). Compensation for temporary impacts shall include land acquisition and/or preservation at a 0.5:1 ratio. The preserved habitat for a significantly impacted plant species shall be of equal or greater habitat quality to the impacted areas in terms of soil features, extent of disturbance, vegetation structure, and will contain verified extant populations, of the same size or greater, of the special-status plants that are impacted. Impacts could include direct impacts resulting from loss of habitat or indirect impacts if a significant population or portion thereof is unable to be avoided.</p> <p>Habitat shall be preserved by using permanent open space easements. Mitigation lands cannot be located on land that is currently publicly held.</p> <p>Mitigation lands may include (depending on the habitat requirements of particular species) the following:</p> <ul style="list-style-type: none"> <li>• Areas outside the Project boundary, but within the County</li> <li>• Preservation areas within portions of the Project Site that are at least 100 feet from Project facilities and are either (1) not permanently impacted by construction and operation of the Project, or (2) are temporarily disturbed and then restored according to the requirements in Mitigation Measure BR-2</li> <li>• Criteria for appropriate mitigation land are species-specific; however, the following factors must be considered in assessing the quality of potential mitigation habitat: (1) Current land use; (2) Location (e.g., habitat corridor, part of a large block of existing habitat, adjacency to source populations, proximity to Project facilities or other potential sources of</li> </ul>	<p>Prior to Construction</p>	<p>Project Applicant</p>	<p>Imperial County, CDFW, USFWS, CNPS</p>

<p>which the easement(s) will be conveyed if the original holder is dissolved</p> <ul style="list-style-type: none"> <li>Be subject to the management requirements outlined in Mitigation Measure BR-2</li> </ul> <p>If lands acquired or protected for the compensation of permanent impacts to wildlife and/or vegetative communities contain similar sized populations of the impacted special-status plant species, of equal or greater habitat value, these mitigation lands may be used to achieve the required compensation ratios for special status plant species.</p>				
<p><b>BR-13: Complete Focused Pre-Construction Surveys for American Badger and Desert Kit Fox Surveys and Implementation of Avoidance Measures</b></p> <p>No more than 30 days prior to the commencement of construction activities, the Applicant shall retain a qualified biologist to conduct pre-construction surveys for American badger and desert kit fox within suitable habitat on the Project Site. If present, occupied dens shall be flagged and ground-disturbing activities avoided within 50 feet of the occupied den. Maternity dens shall be avoided during pup-rearing season (15 February through 1 July) and a minimum 200-foot buffer established. The extent of buffers shall be flagged in the field utilizing a method highly visible by construction crews. Buffers may be modified with the concurrence of the CDFW. Maternity dens shall be flagged for avoidance, identified on construction maps, and a biological monitor shall be present during construction to monitor for adequate protection of all identified dens and to help ensure that all flagging is kept in good working order.</p> <p>If avoidance of a non-maternity den (impacts to maternity dens is not allowed) is not feasible, badgers or foxes shall be relocated by slowly excavating the burrow (either by hand or mechanized equipment under the direct supervision of the biologist, removing no more than 4 inches at a time) before or after the rearing season (15 February through 1 July). Any passive relocation of badgers or foxes shall occur only after consultation with the CDFW and the biological monitor.</p> <p>Prior to the final County inspection or occupancy, whichever comes first, a written report documenting all badger related activities (e.g., den flagging, monitoring, badger removal, etc.) shall be provided to the County. A copy of the report will also be provided to the CDFW.</p>	Prior to Construction	Project Applicant	Imperial County, CDFW	
<p><b>BR-14: Pre-Construction Surveys and Avoidance/Relocation Measures for Flat-tailed Horned Lizard</b></p> <p>Focused pre-construction surveys shall be conducted for flat-tailed horned lizard. During construction, areas of active surface disturbance shall be surveyed</p>	Prior to Construction	Project Applicant	Imperial County, CDFW, USFWS	

Mitigation Measure	Required Time of Compliance	Responsible Implementing Party	Responsible Monitoring Party	Status of Implementation
<p>periodically, at least hourly, when surface temperatures exceed 29°C (85°F) for the presence of flat-tailed horned lizard. Flat-tailed horned lizards would be removed from harm's way during construction activities by the on-site biological monitor(s). To the extent feasible, methods to find flat-tailed horned lizards would be designed to achieve a maximal capture rate and would include, but not be limited to using strip transects, tracking, and raking around shrubs. During construction, the minimum survey effort would be 30 minutes per 0.40 hectare (one acre). Persons that handle flat-tailed horned lizards would first obtain all necessary permits and authorization from the CDFW. A Horned Lizard Observation Data Sheet and a Project Reporting Form, per Appendix 8 of the Rangewide Management Strategy, would also need to be completed. During construction, quarterly reports describing flat-tailed horned lizards removal activity would be submitted to the USFWS, CDFW, and the County.</p> <p>The removal of flat-tailed horned lizard out of harm's way would include relocation to nearby suitable habitat in low-impact areas of the Yuba Management Area, which is located to the west and south of the Project Site. Relocated flat-tailed horned lizards would be placed in the shade of a large shrub in undisturbed habitat. If surface temperatures in the sun are less than 24°C (75°F) or exceed 38°C (100°F), a qualified biologist, if authorized, would hold the flat-tailed horned lizard for later release. Initially, captured flat-tailed horned lizards would be held in a cloth bag, cooler, or other appropriate clean, dry container from which the lizard cannot escape. Lizards would be held at temperatures between 75°F and 90°F and would not be exposed to direct sunlight. Release would occur as soon as possible after capture and during daylight hours. The qualified biologist would be allowed some judgment and discretion when relocating lizards to maximize survival of flat-tailed horned lizards found in the Project area.</p> <ul style="list-style-type: none"> <li>To the maximum extent practicable, grading in flat-tailed horned lizard habitat would be conducted during the active season, which is defined as March 1 through September 30, or when ground temperatures are between 24°C (75°F) and 38°C (100°F). If grading cannot be conducted during this time, any flat-tailed horned lizards found would be removed to low-impact areas (see above) where suitable burrowing habitat exists, (e.g., sandy substrates and shrub cover).</li> </ul>				
<p><b>BR-15: Compensation for Impact to Flat-Tailed Horned Lizard</b></p> <p>Pursuant to Title 43 CFR and the Federal Land Policy and Management Act of 1976, federal land management agencies may permit actions that result in flat-tailed horned lizard habitat loss on their lands; however, for losses both within and outside the Management Areas, compensation is charged if residual effects would</p>	After construction	Project Applicant	Imperial County	

Mitigation Measure	Required Time of Compliance	Responsible Implementing Party	Responsible Monitoring Party	Status of Implementation
<p>occur after all reasonable on-site mitigation has been applied. The goal of compensation is to prevent the net loss of flat-tailed horned lizard habitat and make the net effect of a project neutral or positive to flat-tailed horned lizards by maintaining a habitat base for flat-tailed horned lizards. To achieve this goal, compensation will be based on the acreage of flat-tailed horned lizard habitat lost after all reasonable on-site mitigation has been applied at a 1:1 ratio for habitat lost outside a flat-tailed horned lizard Management Area. For this Project, compensation will be required for a loss of approximately 54 acres of flat-tailed horned lizard habitat.</p>				
<p><b>BR-16: Develop a Habitat Mitigation and Monitoring Plan</b></p> <p>To help ensure the success of on-site preserved land and acquired mitigation lands, required for compensation of permanent impacts to vegetative communities and listed or special-status plants and wildlife, the Applicant shall retain a qualified biologist to prepare a Habitat Monitoring and Mitigation Plan (HMMP). The HMMP will be submitted to the County for approval, prior to the issuance of a construction permit. Prior to the final County inspection final impact acreages must be presented to the County and acquisition of off-site lands must be verified.</p> <p>The HMMP will include, at a minimum, the following information:</p> <ul style="list-style-type: none"> <li>a) Summary of anticipated habitat impacts and the proposed mitigation.</li> <li>b) Detailed description of the location and boundaries of undisturbed Project areas proposed for preservation, off-site mitigation lands and a description of existing site-wide conditions. The HMMP shall include detailed analysis showing that the mitigation lands meet the performance criteria outlined in MM BR-2 (Develop a Habitat Restoration Plan) and MM BR-15 (Compensate for Impacts to Flat-Tailed Horned Lizard).</li> <li>c) Discussion of measures to be undertaken to enhance (e.g., through focused management) the on-site preserved habitat and off-site mitigation lands for listed and special-status species.</li> <li>d) Description of management and maintenance measures (e.g., vegetation management, fencing maintenance, etc.).</li> <li>e) Discussion of habitat and species monitoring measures for on-site preservation areas and offsite mitigation lands, including specific objectives, performance criteria, monitoring methods, data analysis, reporting requirements, monitoring schedule, etc.</li> <li>f) Development of a monitoring strategy for the monitoring of indirect impacts to vegetation and wildlife from alteration to the solar and hydric regimes as a result of Project facilities.</li> <li>g) Development of a monitoring strategy, which shall serve to document the persistence of flat-tailed horned lizard populations within the Project Site and on mitigation lands. This monitoring will be conducted for a minimum</li> </ul>	<p>Prior to and after construction</p>	<p>Project Applicant</p>	<p>Imperial County</p>	

Mitigation Measure	Required Time of Compliance	Responsible Implementing Party	Responsible Monitoring Party	Status of Implementation
<p>of 5 years after the completion of construction activities. The strategy should include, at the minimum, the following:</p> <ul style="list-style-type: none"> <li>h) Documentation of pre-Project population levels for the species noted above, based on results of focused pre-construction surveys and previously supplied Applicant data.</li> <li>i) On-going monitoring of species populations upon completion of construction activities, while the Project is in operation, for a minimum of three years.</li> <li>j) Monitoring of reference populations for this species in areas that contain undisturbed habitat, such as the Yuba Management Area.</li> <li>k) An analysis of the comparison of percent changes in population levels at the Project and reference sites to be used in the determination of additional compensatory mitigation.</li> <li>l) The applicant shall prepare a contingency plan for mitigation elements that do not meet performance or final success criteria within 5 years. This plan will include specific triggers for remediation if performance criteria are not being met and a description of the process by which remediation of problems with the mitigation site (e.g., presence of noxious weeds) will occur.</li> </ul>				
<p><b>BR-17: Burrowing Owl Protection Measures</b>  The following measures shall be implemented during Project construction, operation, and decommissioning with respect to burrowing owls:</p> <ul style="list-style-type: none"> <li>• A qualified biologist(s) shall be on-site during all construction activities in suitable burrowing owl habitat. A qualified biologist (i.e., a biologist with previous burrowing owl survey experience) shall conduct pre-construction clearance surveys of the permanent and temporary impact areas to locate active breeding or wintering burrowing owl burrows no more than 14 days prior to construction. The survey methodology shall be consistent with the methods outlined in the CDFG Staff Report (CDFG 2012). Copies of the survey results shall be submitted to CDFW and the County.</li> <li>• If no burrowing owls are detected, no further mitigation is necessary. If burrowing owls are detected, no ground-disturbing activities, such as road construction or facility construction, shall be permitted except in accordance with the staff report or by written authorization of CDFW staff. Burrowing owls shall not be excluded from burrows unless or until a Burrowing Owl Exclusion Plan is developed by the lead biologist and approved by the applicable local CDFW office and submitted to the County. The plan shall adhere to the requirements set forth in the Burrowing Owl Mitigation Staff Report (CDFW 2012).</li> </ul>	<p>Prior to and during construction</p>	<p>Project Applicant</p>	<p>Imperial County, CDFW</p>	

Mitigation Measure	Required Time of Compliance	Responsible Implementing Party	Responsible Monitoring Party	Status of Implementation
<ul style="list-style-type: none"> <li>In accordance with the Burrowing Owl Exclusion Plan, a qualified biologist shall excavate burrows using hand tools. Sections of flexible plastic pipe or burlap bag shall be inserted into the tunnels during excavation to maintain an escape route for any animals inside the burrow. One-way doors shall be installed at the entrance to the active burrow and other potentially active burrows within 160 feet of the active burrow. Forty-eight hours after the installation of the oneway doors, the doors can be removed, and ground-disturbing activities can proceed. Alternatively, burrows can be filled to prevent reoccupation.</li> <li>During construction activities, monthly and final compliance reports shall be provided to CDFW, the County, and other applicable resource agencies documenting the effectiveness of mitigation measures and the level of burrowing owl take associated with the Project.</li> </ul>				
<p><b>BR-18: Compensation for Impacts to Burrowing Owl</b></p> <p>Should burrowing owls be found on-site, compensatory mitigation for lost breeding or wintering habitat shall be implemented on-site or off-site in accordance with Burrowing Owl Mitigation Staff Report guidance and in consultation with CDFW.</p> <p>At a minimum, the following recommendations shall be implemented:</p> <ul style="list-style-type: none"> <li>Temporarily disturbed habitat shall be restored, if feasible, to pre-Project conditions, including decompaction soil and revegetating.</li> <li>Permanent impacts to nesting, occupied and satellite burrows, and burrowing owl habitat shall be mitigated such that the habitat acreage, number of burrows, and burrowing owl impacted are replaced at a 1:1 ratio based on a site-specific analysis that shall include the following: <ul style="list-style-type: none"> <li>Permanent conservation of similar vegetation communities to provide for burrowing owl nesting, foraging, wintering, and dispersal (i.e., during breeding and nonbreeding seasons) comparable to or better than that of the impact area, and with sufficiently large acreage, and presence of fossorial mammals.</li> <li>Permanently protect mitigation lands through a conservation easement deeded to a nonprofit conservation organization or public agency with a conservation mission. If the Project is located within the service area of a CDFW-approved burrowing owl conservation bank, the applicant may purchase available burrowing owl conservation bank.</li> </ul> </li> </ul> <p>If the acquired lands or mitigation credits for other wildlife species or vegetation communities can be managed to support burrowing owl, the proposed mitigation lands could be aggregated so that the purchase of mitigation lands for one species could cover all or a portion of the mitigation requirements for the remaining</p>	During and after construction	Project Applicant	Imperial County, CDFW	

Mitigation Measure	Required Time of Compliance	Responsible Implementing Party	Responsible Monitoring Party	Status of Implementation
species. Mitigation lands shall not already be public land.				
<b>GEOLOGY AND SOILS</b>				
<p><b>GEO-1: Inadvertent Discovery</b></p> <p>In the event that unanticipated paleontological resources or unique geologic resources are encountered during ground-disturbing activities, work must cease within 50 feet of the discovery and a paleontologist shall be hired to assess the scientific significance of the find. The consulting paleontologist shall have knowledge of local paleontology and the minimum levels of experience and expertise as defined by the Society of Vertebrate Paleontology's Standard Procedures (2010) for the Assessment and Mitigation of Adverse Impacts to Paleontological Resources. If any paleontological resources or unique geologic features are found within the Project Site, the consulting paleontologist shall prepare a paleontological Treatment and Monitoring Plan to include the methods that will be used to protect paleontological resources that may exist within the Site, as well as procedures for monitoring, fossil preparation and identification, curation of specimens into an accredited repository, and preparation of a report at the conclusion of the monitoring program.</p>	During construction	Project Applicant	Imperial County	
<b>HYDROLOGY AND WATER QUALITY</b>				
<p><b>HYD-1: Prepare Stormwater Pollution Prevent Plan and Implement Best Management Practices</b></p> <p>Prior to issuance of any grading permit, the Applicant or its contractor shall prepare a Project-specific SWPPP and be responsible for securing coverage under SWRCB's NPDES stormwater permit for general construction activity (Order 2009-0009-DWQ). The SWPPP shall detail the treatment measures and BMPs to control pollutants that shall be implemented and complied with during both the construction and decommissioning of the Project. Example BMPs may include but are not limited to the following practices:</p> <ul style="list-style-type: none"> <li>• Designation of restricted-entry zones</li> <li>• Sediment tracking control measures (e.g., crushed stone or riffle metal plate at construction entrance)</li> <li>• Truck washdown areas</li> <li>• Diversion of runoff away from disturbed areas</li> <li>• Protective measures for sensitive areas, outlet protection</li> <li>• Provision mulching for soil stabilization during construction, and provision for revegetation upon completion of construction within a given area</li> <li>• Treatment measures to trap sediment once it has been mobilized, such as straw bale barriers, straw mulching, fiber rolls and wattles, silt fencing,</li> </ul>	Prior to construction	Project Applicant, Construction Contractor	Imperial County, Imperial Irrigation District	

Mitigation Measure	Required Time of Compliance	Responsible Implementing Party	Responsible Monitoring Party	Status of Implementation
and siltation or sediment ponds				
<p><b>HYD-2: Final Project Drainage Plan</b></p> <p>Prior to issuance of any grading permit, the applicant shall submit a Final Project Drainage Plan. The Drainage Plan shall adhere to the County's Engineering Guidelines Manual, IID "Draft" Hydrology Manual, or other recognized source with approval by the County Engineer to control and manage the discharge of stormwater to the proposed retention basins. Retention basins shall be integrated into the Drainage Plan to the maximum extent practical. The Drainage Plan shall provide both short- and long-term drainage solutions to ensure the proper sequencing of drainage facilities and management of runoff generated from the Project's impervious surfaces, as necessary.</p>	Prior to construction	Project Applicant, Construction Contractor	Imperial County, Imperial Irrigation District	
<b>TRIBAL CULTURAL RESOURCES</b>				
<p><b>CULT-1: Workers Environmental Awareness Program</b></p> <p>A qualified archaeologist shall be retained to prepare a cultural resource focused Workers Environmental Awareness Program (WEAP) training that shall be given to all ground disturbing construction personnel to minimize harm to undiscovered archaeological resources or potential tribal resources that may be discovered during construction. All Site workers shall be required to complete WEAP Training with a focus on cultural resources, including education on the consequences of unauthorized collection of artifacts and that reviews discovery protocol. WEAP training shall also explain the protocol for notification, and requirements to retain a qualified archaeologist to evaluate any unexpected finds, as well as protocols regarding notification of tribal representatives.</p>	Prior to and during construction	Project Applicant	Imperial County	
<p><b>CULT-2: Continued Consultation with the San Pasqual Band of Mission Indians</b></p> <p>If no other responses to Imperial County's invitation to consult on the Project are received, prior to construction, the County shall continue consultation with the San Pasqual Band of Mission Indians (San Pasqual). If the County, as the lead agency, determines through continued consultation that there is substantial evidence the Project may adversely impact a yet unidentified Tribal Cultural Resource that meets criteria established in Public Resources Code Section 5024.1, the County shall determine if measures are needed to minimize potential impacts to TCRs including:</p> <ul style="list-style-type: none"> <li>• Requirements for Native American Monitoring of Project Ground Disturbing Activities</li> <li>• Development of an Unexpected Discovery Plan for Archaeological</li> </ul>	Prior to construction	Project Applicant	Imperial County	

# **F.Development Agreement**

## **RESOLUTION NO.**

### **A RESOLUTION OF THE PLANNING COMMISSION OF THE COUNTY OF IMPERIAL, CALIFORNIA, RECOMMENDING TO THE IMPERIAL COUNTY BOARD OF SUPERVISORS APPROVAL OF THE DEVELOPMENT AGREEMENT FOR THE WESTSIDE CANAL BATTERY STORAGE PROJECT**

**WHEREAS**, a Development Agreement has been prepared in accordance with the requirements of the California Environmental Quality Act, the State CEQA Guideline, the County's "Rules and Regulations to Implement CEQA, and the County's Land Use Ordinance, Title 9 as amended; and

**WHEREAS**, the Planning Commission of the County of Imperial has been delegated with the responsibility of making recommendations to the Imperial County Board of Supervisors for approval of the Development Agreement; and

**WHEREAS**, public notice of said application has been given, and the Planning Commission has considered evidence presented by the Imperial County Planning & Development Services Department and other interested parties at a public hearing held with respect to this item on October 27, 2021.

**NOW THEREFORE**, the Planning Commission of the County of Imperial **DOES HEREBY RESOLVE** as follows:

**SECTION 1.** The Planning Commission has considered the proposed Development Agreement prior to making a decision to recommend that the Board of Supervisors approve the proposed Development Agreement (DA). The Planning Commission finds and determines that the DA is adequate and prepared in accordance with the requirements recommended by the county's Director of planning and development services as being consistent with the county's general plan and the provisions of Division 23 of Title 9 of the County of Imperial Codified and has been recommended by the county planning commission that it:

1. Is consistent with the objectives, policies, general land uses, and programs specified in the general plan:

The proposed DA and underlying project have been analyzed and has been found to be consistent with the County's General Plan, and the objectives, policies, general land uses, and programs stated therein. Specifically, the DA is consistent with the County's Land Use Element, which is a part of an incorporated within the County's General Plan.

2. Is compatible with the uses authorized in, and the regulations prescribed for, the zoning district in which the real property is or will be located:

The proposed DA covers a battery storage project. The property covered by the DA will be rezoned to M-2 Medium Industrial, which allows battery storage facilities under a valid conditional use permit.

3. Is in conformity with and will promote public convenience, general welfare, and good land use practice:

The proposed DA will promote convenience, general welfare, and good land use practice by requiring the developer of the project to comply with all applicable federal, state, and local land use laws. The DA also requires developer to pay certain impact fees and benefit fees that will be utilized to mitigate impacts caused by the project and further promote the general welfare of the County.

4. Will not be detrimental to the health, safety, or general welfare of the public:

The proposed DA has been analyzed relative to its potential to be detrimental to the health, safety, comfort and welfare of the persons residing or working within the neighborhood of the proposed DA. Staff concluded that the project does not propose land uses, densities, or development patterns that will jeopardize the health and safety of the persons residing or working within the neighborhood of the property. Health, safety, and welfare will not be degraded as a result of this project.

5. Will not adversely affect the orderly development of property or the preservation of property values:

The Commission and the Board of Supervisors has negotiated a development agreement in order to provide for the orderly development of the project; and

6. Will provide significant public benefits:

Economic Impact Analyses, Employment (Jobs) Impact Analyses and Fiscal Impact Analyses prepared for this project have repeatedly demonstrated that in addition to other economic benefits (construction jobs, fee payments, etc.), this project will employ more full-time employees compared to the full-time employees estimated to be involved in the farming of grass-type crops with "fiscal benefits from increased economic activity and local employment opportunities that do not threaten the economic viability of other industries." The conclusion is that the Project will have a clear long term economic benefit to the County as determined by the Fiscal and Impact Analysis previously done for the County on this project.

That the Planning Commission does hereby recommend the Board of Supervisors approve the Westside Canal Battery Storage Development Agreement.

**NOW, THEREFORE**, based on the above findings, the Planning Commission of the County of Imperial **DOES HEREBY RECOMMEND** that the Board of Supervisors

approve the proposed Development Agreement for the Westside Canal Battery Storage Project.

---

Rudy Schaffner, Chairperson  
Imperial County Planning Commission

I hereby certify that the preceding resolution was taken by the Planning Commission at a meeting conducted on **October 27, 2021** by the following vote:

The Board of Supervisors of the County of Imperial, State of California, does hereby ordain as follows:

**92310. – Findings – Westside Canal Battery Storage Project.**

- A. Is consistent with the objectives, policies, general land uses, and programs specified in the general plan;
- B. Is compatible with the uses authorized in, and the regulations prescribed for, the zoning district in which the real property is or will be located;
- C. Is in conformity with and will promote public convenience, general welfare, and good land use practice;
- D. Will not be detrimental to the health, safety, or general welfare of the public;
- E. Will not adversely affect the orderly development of property or the preservation of property values; and
- F. Will provide significant public benefits.

1 The board concurs in these recommendations and specifically finds that the provisions of the  
2 development agreement are consistent with the county's general plan. The board further finds  
3 that the underlying development project to which the development agreement relates was subject  
4 to full and proper environmental review under CEQA. Findings regarding the same are contained  
5 in board of supervisors Resolution 2021-\_\_\_\_\_. The adoption of this ordinance in this chapter  
6 is based on those findings.

7 **92310.\_\_\_\_ – Approval.**

8 Pursuant to the authorization provided in Sections 65864 et seq. of the California Government  
9 Code, and the County of Imperial Codified Ordinances, the board approves the development  
10 agreement. The board authorizes the chairperson of the board to execute the development agreement  
11 on behalf of the county.

12 **92310.\_\_\_\_ – Statute of Limitations.**

13 No action or proceeding ("action") may be brought by a person, public agency, public or private  
14 corporation, partnership, association, organization, or other business or business entity other than the  
15 parties to the development agreement or their successors, to attack, interpret, set aside, void, or annul  
16 all or any part of the development agreement, or the decision of the county of imperial to approve and  
17 execute the development agreement, unless the action is commenced and service made on the county  
18 of imperial within one hundred twenty (120) days from the county's adoption of the ordinance codified  
19 in this section.

20 **SECTION 2:** This Ordinance shall take effect and shall be in force thirty (30) days after the date  
21 of its adoption, and prior to the expiration of fifteen (15) days from the passage thereof, a summary of  
22 this Ordinance shall be published at least once in the Holtville Tribune, a newspaper of general  
23 circulation, printed and published in the County of Imperial, State of California, together with the names  
24 of the members of the Board of Supervisors voting for and against the same.

25 **SECTION 3:** A complete executed copy of this Ordinance shall be on file with the Office of the  
26 Clerk of the Board of Supervisors. It shall be available for review at the County Administration Center,  
27  
28

1 located at 940 W. Main Street, Suite 209, El Centro, California, 92243. The Clerk of the Board of  
2 Supervisors may be reached at (442) 265-1020.

3 **SECTION 4: Severability.** If any provision or clause of this Ordinance or the application thereof  
4 to any person or circumstances is held to be unconstitutional or to be otherwise invalid by any court of  
5 competent jurisdiction, such invalidity shall not affect other Ordinance provisions or clauses or  
6 applications thereof that can be implemented without the invalid provision or clause or application, and  
7 to this end the provisions and clauses of this ordinances are declared to be severable.

8 **PASSED, ADOPTED, AND APPROVED** by the Board of Supervisors of the County of Imperial  
9 this \_\_\_\_ day of \_\_\_\_\_, 2021.

### **Imperial County Development Agreement Concerning Westside Battery Storage**

**THIS DEVELOPMENT AGREEMENT** ("Agreement") is entered into by and between the County of Imperial, a political subdivision of the State of California, ("County") and CED Westside Canal Battery Storage, LLC, a limited liability company licensed to do business in the state of California ("Developer") (individually, "Party;" collectively, "Parties") with respect to the development of real property in the County, known as the Westside Battery Storage Project ("Project").

1. **AUTHORIZATION.** California Government Code Sections 65864 through 65869.5 and Title 9, Division 23 of the County of Imperial Codified Ordinances (Sections 92301 – 92309) authorize the County to enter into binding development agreements with persons having legal or equitable interests in real property for the development of the property in order to establish certainty in the development process.
2. **PROPERTY AND PROJECT DESCRIPTION.**
  - 2.1. **Property Description.** The real property which is the subject of this Agreement consists of individual parcels in the Mount Signal area, directly south of the intersection of Liebert Road and the Westside Main Canal in the unincorporated Imperial County, and is more particularly described in **Exhibit "A"** attached hereto ("Property").
  - 2.2. **Project Description.** The development that is the subject of this Agreement consists of the Project as described in the Final Environmental Impact Report ("FEIR") certified by the Board of Supervisors. Generally, the Project consists of: one (1) Conditional Use Permit to develop a utility-scale energy storage complex incorporating lithium ion batteries and/or flow battery technologies throughout the Project site ("CUP"); one (1) Zone Change to change the zone of Property from A-3 (Heavy Agriculture) to M-2 (Medium Industrial) ("ZC"); amendment of Imperial County's General Plan Renewable Energy and Transmission Element to create an Island Overlay for the project site, as defined in County Code section 91701.01; and one (1) Development Agreement.
3. **LEGAL OR EQUITABLE INTEREST IN PROPERTY.** Developer is the owner of the Property upon which the battery storage Project is to be constructed.

**4. APPROVALS.**

- 4.1. This Agreement was approved by Ordinance No. \_\_\_\_\_ (“DA Ordinance”), adopted on \_\_\_\_\_, 2021, and shall be effective on the date the DA Ordinance becomes effective (“Effective Date”)
- 4.2. As of the Effective Date, this Agreement has been given all required discretionary approvals from the following County entities:
  - 4.2.1. Environmental Evaluation Committee;
  - 4.2.2. Planning Commission;
  - 4.2.3. Board of Supervisors.
- 4.3. County and Developer agree that the Planning Commission and Board of Supervisors provided their recommendations and discretionary approvals for the Project and received all public testimony thereon at public hearings properly noticed as provided in Government Code Sections 65867, 65090, and 65091, and County of Imperial Codified Ordinances Section 92303, in addition to any other notice required by law for other actions considered concurrently with the Agreement.
- 4.4. County and Developer agree that all environmental impacts associated with the development of the Project as provided under this Agreement have been analyzed and adequately addressed in the FEIR in accordance with the California Environmental Quality Act (“CEQA”), and that the adoption of this Agreement will not result in any new or different significant environmental effect, or substantial increase in severity of a previously identified significant environmental impact considered in the certified FEIR.

**5. ENTITLEMENTS; STATUTORY REQUIREMENTS FOR DEVELOPMENT AGREEMENT; PERMITTED USES; DENSITY/INTENSITY OF USE; HEIGHT AND SIZE; DEDICATION OF PUBLIC LANDS.**

- 5.1. **Entitlements.** The County’s Board of Supervisors has approved the following land use entitlements for the Property, which entitlements and their implementation are the subject of this Agreement:
  - 5.1.1. FEIR.
  - 5.1.2. CEQA Findings and Mitigation Monitoring and Reporting Program (“MMRP”).
  - 5.1.3. Water Supply Assessment.

5.1.4. GPA 19-0003 to create an Island Overlay for the Project site.

5.1.5. ZC 19-0004 to change the zone of the Property from A-3 (Heavy Agriculture) to M-2 (Medium Industrial).

5.1.6. CUP 19-0015 to develop a utility-scale energy storage complex incorporating lithium ion batteries and/or flow battery technologies throughout the Project site.

5.2. **Permitted Uses.** The permitted uses of the Property are those uses authorized and described in the CUP, those uses described in the FEIR, and those uses allowed by right and conditionally within the existing zones.

5.3. **Density/Intensity of Use.** The permitted density and intensity of use shall not exceed the density and intensity of the uses authorized and described in the CUP, those uses described in the FEIR, or those uses allowed by right and conditionally within the existing zones.

5.4. **Height and Size.** The permitted height and size of proposed structures shall be the limits allowed by the existing zone.

5.5. **Dedication/Reservation Public Lands.** The provisions for reservation or dedication of lands for public purposes are those described in the FEIR for open space or habitat protection.

6. **DURATION OF AGREEMENT AND ENTITLEMENTS; PHASING; EARLY TERMINATION OF CUPS.**

6.1. The term of this Agreement shall commence on the Effective Date as defined in Paragraph 4.1, and shall extend for a period of ten (10) years following the Effective Date. This Agreement may be extended by mutual agreement of the Parties, or by authorization of the Planning Director, as set forth in the County of Imperial Codified Ordinances.

6.1.1. Any building permit under which construction has not commenced within three (3) years of issuance, and any CUP on which Commencement of Construction (as defined below) has not commenced by the tenth (10th) anniversary of the Effective Date of this Agreement, shall be of no further force and effect. In that event, the Parties agree that notwithstanding any other provisions of this Agreement or the entitlements, any CUP not so commenced shall terminate on that tenth (10th) anniversary date without notice or hearing. Developer agrees that such termination is voluntarily negotiated and waives any notice or public hearing of such termination. Developer agrees that there shall be no vested right and no legal remedy

available to Developer if any CUP terminates for failure to Commence Construction.

6.1.2. Notwithstanding any other provisions of this Agreement or the entitlements, in no event shall any entitlement exceed forty (40) years from the Effective Date of this Agreement. Such termination of the entitlements is consensual and shall not be subject to a public hearing.

6.1.3. As used here, "Commence Construction" or "Commencement of Construction" means the earlier of the date on which Developer obtains a grading permit or building permit, as may be applicable, in reliance on a CUP. Developer agrees that there shall be no vested right and no legal remedy available to Developer if such CUP terminates for failure to Commence Construction.

6.2. The term of this Agreement may terminate sooner as provided herein.

6.3. This Agreement shall run with the Property for the term of this Agreement, and shall bind each and every owner of such Property.

## **7. RULES, REGULATIONS, AND POLICIES.**

7.1. County acknowledges that Developer would not enter into this Agreement or agree to provide the public benefits and improvements described in this Agreement if it were not for the commitment of the County that the Property can be developed, in accordance with County's ordinances, rules, regulations, and policies, including but not limited to those governing permitted uses of the land, governing density, and governing design, improvement, and construction standards and specifications applicable to the development of the Property existing as of the Effective Date of this Agreement.

7.2. The Property shall not be subject to any subsequently enacted amendment, modification of, or substitution for, the General Plan, zoning, or subdivision ordinances without the mutual written consent of the County and Developer, except as otherwise provided here.

7.3. Except as otherwise provided in this Agreement, Developer shall have the right, to the fullest extent permitted under California Government Code Sections 65864 et seq. and provisions of the County of Imperial Codified Ordinances to: (1) develop the Property in accordance with this Agreement, rules, regulations, ordinances, policies, conditions, environmental regulations, exactions, entitlements, assessments, payments, and fees applicable to and governing development of the Property in effect as of the Effective Date of this Agreement; and (2) develop the Property with respect to the permitted use(s) of land, density, and intensity of use(s), and timing and phasing of development as generally described in this

Agreement and in the entitlements set forth in Section 5 of this Agreement in effect as of the Effective Date of this Agreement, provided that:

- 7.3.1. Developer acknowledges that the Project must comply with all future amendments, modifications, or alterations of County's building, plumbing, mechanical, electrical, signage, and fire codes.
- 7.3.2. If a conflict between this Agreement and federal or State laws or regulations arises that prevents or precludes compliance with one or more provisions of this Agreement, such provisions of the Agreement shall, without further action by either Party, be deemed suspended as may be necessary to allow continuous compliance with such State or federal laws or regulations, and such suspension shall mean that non-compliance with such suspended provisions shall not be a breach of this Agreement from and after the date on which such conflict arose. County and Developer shall meet and confer in good faith in a reasonable attempt to modify the suspended terms of this Agreement to the extent feasible so that such terms, as modified, can be met without conflicting with federal or State laws or regulations.
- 7.3.3. Nothing in this Agreement shall be construed to be in derogation of County's police power to protect the public health and safety in the event of a sudden, unexpected occurrence, involving a clear and imminent danger, demanding immediate action to prevent or mitigate loss of, or damage to, life, health, property, or essential public services involving the Property or the community.
- 7.3.4. Developer acknowledges that the Project must comply with any new or amended ordinance, resolution, rule, regulation, or policy that does not conflict with the entitlements, or those ordinances, resolutions, rules, regulations, and policies in effect at the Effective Date, and that is generally applied equally to all real property in the County with the same zoning designations and/or land uses. A conflict is one that would significantly limit the authorized disturbance area within the applicable CUP. Developer further acknowledges that this Agreement does not prevent the County from denying or conditionally approving any subsequent discretionary development project application on the basis of such existing or new rules or regulations.
- 7.3.5. This Agreement shall not be construed to limit the authority or obligation of County to hold necessary public hearings, or to limit the discretion of County or any of its officers or officials with regard to rules, regulations, ordinances, laws, and entitlements of use that require the exercise of discretion by County, or any of its officers or officials, provided that subsequent discretionary actions: (1) shall not prevent or delay development of the Property for the uses and to the density and intensity of development as provided by this Agreement and the other entitlements in effect as of the

Effective Date of this Agreement; and (2) shall not be inconsistent with the entitlements.

8. **INFRASTRUCTURE CAPACITY.** Subject to conditions of approval requiring specific upgrades, County hereby acknowledges that it has been informed that the Project will have sufficient capacity in its infrastructure, services, and utility systems, including without limitation, traffic circulation, flood control, water supply treatment, distribution, and service, to accommodate the Project.
9. **PUBLIC BENEFITS PROVIDED BY DEVELOPER.** County acknowledges that Developer's performance under this Agreement provides significant public benefits to County, including, but not limited to:
  - 9.1. **FEIR Mitigation Measures and Conditions of Approval.** Notwithstanding any other provision in this Agreement to the contrary, if Developer elects to develop the Project on the Property, Developer shall be bound by, and shall perform, all CUP provisions, conditions of approval and mitigation measures for which Developer is responsible as contained in the Project entitlements and certified FEIR for the Project, as well as those provided in this Agreement, and failure to do so without prior County authorization shall be a default under this Agreement as well as the CUP. In the event of a conflict among the terms of Agreement, a CUP, and the FEIR / MMRP, the hierarchy of documents that shall control the Parties' rights and obligations are the FEIR, MMRP, the Agreement, then the CUP.
  - 9.2. **Sales Tax Benefit.**
    - 9.2.1. To the extent permitted by applicable local, state, and Federal law, Developer will require that all qualifying contractors and subcontractors exercise their option to obtain a California Department of Tax and Fee Administration ("CDTFA") sub-permit for the jobsite and allocate all eligible sales and use tax payments to County and the Local Transit Authority ("LTA").
    - 9.2.2. Prior to commencement of any construction activity onsite, Developer shall require that the contractor or subcontractor provide County with a copy of their CDTFA account number and sub-permit. Developer shall either cause its construction contractor to treat the Project in accordance with California Sales and Use Tax Regulation 1521(b)(2)(B), California Sales and Use Tax Regulation 1521(c)(13)(B), and California Sales and Use Tax Regulation 1826(b) for sales and use tax purposes, or form a "Buying Company," as defined in the California Sales and Use Tax Regulation 1699(h). Developer may adopt an alternate methodology to accomplish this goal if such methodology is approved by the County's Executive Officer prior to issuance of any building permit.

**9.2.3.** No later than forty-five (45) days after the due date for filing sales and use tax returns for each calendar quarter, occurring after the commencement of any construction activity on-site through and including the first anniversary of commercial operating date ("COD"), Developer shall report, or cause its general contractor to report to County, the total amount of sales and use taxes related to the Project that are allocated to the County, and reported on Developer's, general contractor's and subcontractors' applicable California sales and use tax returns.

**9.2.4. *Guarantee Amounts.*** Prior to the issuance of any building permit for the Project, Developer shall provide County with a guarantee of the minimum sales and use that will be received by County and LTA under existing applicable sales and use tax laws. The guarantee amount shall be based on the total storage capacity of the Project in megawatts, which is projected to be two thousand megawatts ("2000 MW"). Should Developer choose to develop the Project in phases, and receives the required approvals from County to do so, then Developer shall provide a separate guarantee amount for each phase of the project based on the total storage capacity in megawatts for the applicable phase.

- (a) Developer warrants that the sales/use tax guarantee amounts to be provided to County as mandated in this Subparagraph 9.2.4 shall be true and accurate estimates of the projected sales and use taxes that will be generated for this Project. Developer shall provide County with evidence of the projected sales/use taxes for the Project, including but not limited to sales tax receipts, and executed or anticipated engineering contracts, procurement contracts, and construction contracts. If the Parties are unable to agree upon a guarantee amount, then the dispute shall be referred to an independent accountant mutually acceptable to both Parties. The costs for such nonbinding mediation shall be borne by Developer.
- (b) Developer warrants that the sales/use tax guarantee amounts to be provided to County as mandated in this Subparagraph 9.2.4 will incorporate any and all sales/use tax exemptions that Developer and/or its contractors and subcontractors intend to utilize, and that such exemptions will be disclosed to County fully and in good faith prior to the issuance of any building permit for this Project.
- (c) Developer understands and acknowledges that the sales/use tax guarantee amounts to be provided to County as mandated by this Subparagraph 9.2.4 are a part of the consideration to be received by County in return for entering into this Agreement, and further understands and acknowledges that County would not enter into this Agreement but for said guarantee from Developer.

**9.2.5.** In the event that County and / or LTA receives less than the amount of sales/use taxes guaranteed pursuant to Subparagraph 9.2.4, then Developer shall pay, as and when provided below, to County or LTA as applicable, the amount of the applicable shortfall.

**9.2.6.** *Adjustments to Guarantee Amounts.*

- (a)** The amount of sales and use tax anticipated to be generated is based on the projected construction of a 2000 MW utility-scale energy storage complex incorporating lithium ion batteries and/or flow battery technologies throughout the Project site. Construction of any additional storage capacity beyond the 2000 MW storage capacity now projected will require the sales/use tax guarantee amounts to be adjusted based on the actual storage facilities of the Project as evidenced by any power purchase agreement or power storage agreement subsequently entered into by Developer related to this Project.
- (b)** To the extent of any reduction in the size of the Project as the result of any final ruling, stipulated judgment, or settlement, the sales/use tax guarantee amounts mandated under Subparagraph 9.2.4 shall be reduced pro rata based on the size of such reduction.
- (c)** Should Developer become aware of a change in circumstances that would materially affect the sales/use tax guarantee amount, then Developer shall, within thirty (30) days of learning of such change in circumstances, inform the County in writing of the change in circumstances. If the County determines that such change in circumstances warrants an adjustment to the sales/use tax guarantee amount, then County shall negotiate in good faith with Developer in revising the sales/use tax guarantee amount. If the Parties are unable to agree upon a revised guarantee amount, then the dispute shall be referred to an independent accountant mutually acceptable to both Parties. The costs for such nonbinding mediation shall be borne by Developer. Failure of the Developer to inform the County of the change in circumstances shall constitute a waiver of Developer's ability to seek any adjustment to the sales/use tax guarantee based on such change in circumstances.

**9.2.7.** The complete sales/use tax guarantee amount due to County and LTA for the Project must be received within one (1) year after COD for this Project, or such later date as any applicable sales/use tax is due or is transmitted from the CDTFA, unless it is delayed due to causes beyond Developer's control or for which Developer is not responsible. If, within one (1) year after issuance of the final certificate of occupancy, or such later date as any applicable sales/use tax is due or is transmitted from the CDTFA, the

sales/use taxes received by the County are less than the sales use tax guarantee amounts mandated under Subparagraph 9.2.4, then Developer shall pay the difference to the County.

**9.2.8.** Payments to County and LTA as a result of a shortfall shall be due within forty-five (45) calendar days of Developer's receipt of written notice of shortfall from the County. Failure to make such payment within the forty-five (45) day timeframe shall be considered a default pursuant to Section 18 of this Agreement, and may lead to termination of this Agreement. Developer hereby agrees to pay interest at the rate of six percent (6%) per annum of the payment due for any payment received by County beyond the forty-five (45) day due date. The obligation to pay interest shall survive the termination of this Agreement. The obligation to pay interest shall be stayed for up to thirty (30) calendar days when such amounts are disputed in good faith, so long as Developer submits the payments "under written protest" with a complete explanation of the reasons for the protest. Upon resolution of the protested payment, such late charges may be assessed if it is determined by County that the dispute was not made in good faith. Repeated protests of the same point rejected in a prior protest shall be considered a protest in bad faith. Any such payments later found not to be due by Developer shall be refunded by County promptly, and in all events within thirty (30) calendar days after the determination of the amounts owing is made.

**9.2.9.** In the event that Developer repowers or replaces the equipment onsite, to the extent permitted under then applicable law, each site shall be designated as the "point of sale" so as to create an additional local tax-funding source for the County of Imperial.

**9.3. Office of Emergency Services Obligations.** In consideration of the potential hazards to County Office of Emergency Services ("Fire/OES") employees associated with responding to fires originating at utility-scale energy storage sites such as the Project, Developer agrees to provide the following:

**9.3.1.** Prior to the issuance of the first grading permit for the Project, Developer shall purchase, or contribute its proportionate share associated with the cost of the purchase, of a Type 1 fire engine, which shall meet all National Fire Protection Association ("NFPA") standards for structural firefighting. Final cost, conditions, and equipment to be installed on the Type 1 fire engine shall be reasonably determined by County Fire/OES, but the total cost of the Type 1 fire engine shall not exceed five hundred thousand dollars (\$500,000).

**(a)** County agrees to require, as a condition of approval of any other utility-scale energy storage project located within the southwest solar power generation and battery storage area, which is generally

described as that area west of the City of Calexico, north of the International Border, east of Dunway Road, and south of Interstate 8 ("Service Area"), that such other utility-scale energy storage projects shall either purchase or contribute their proportionate share for the cost associated with the purchase of the Type 1 fire engine.

- (b) The proportionate cost for utility-scale energy storage developers within the Service Area, including Developer shall be based on a unit price of two hundred fifty dollars (\$250) per megawatt of energy storage.
- (c) If Developer purchases the Type 1 fire engine, Developer shall be reimbursed up to seventy-five percent (75%) of the cost of purchase, not to exceed three hundred seventy-five thousand dollars (\$375,000).
- (d) Conversely, if a Type 1 fire engine has already been purchased by another utility-scale energy storage project developer in the Service Area, then Developer shall only be required to pay their proportionate share to reimburse the purchaser of the Type 1 fire engine, which shall not exceed one hundred twenty-five thousand dollars (\$125,000).
- (e) The County shall be responsible for managing the reimbursement component of this condition.

9.3.2. Developer shall pay County Fire/OES one hundred dollars (\$100) per megawatt of storage capacity at point of interconnection as a one-time payment to provide additional training to Fire/OES personnel during the life of the Project. The nature and frequency of such training shall be at the discretion of County Fire/OES, but shall be intended for assisting with responses to utility-grade energy storage project fires and emergencies. This payment shall be made before issuance of the first building permit for the Project, or for each phase of the Project, whichever is applicable.

9.3.3. Developer shall pay County Fire/OES one hundred fifty dollars (\$150) per megawatt of storage capacity at point of interconnection as a one-time payment to provide additional equipment for Fire/OES personnel during the life of the Project. The type and amount of equipment required shall be at the discretion of County Fire/OES, but shall be intended for assisting with responses to utility-grade energy storage project fires and emergencies. This payment shall be made before issuance of the first building permit for the Project, or for each phase of the Project, whichever is applicable.

- 9.3.4. Developer shall provide an approved water supply capable of supplying the required fire flow to the Project as determined by Appendix B of the 2019 California Fire Code. Developer shall be responsible for all costs associated with the provision of the water supply, including but not limited to installation and maintenance. Developer shall also install and maintain private fire service mains and appurtenance in accordance with NFPA section 24.
- 9.3.5. An approved automatic fire suppression system shall be installed on all required structures as per the 2019 California Fire Code. All fire suppression systems will be maintained to the current adapted fire code and regulations.
- 9.3.6. Project access roads and gates will be installed and maintained in accordance with the current adapted fire code. Developer shall maintain a Knox Box for access to the Project site.
- 9.3.7. Developer shall provide product containment areas(s) for both product and water run-off. All product and water runoff shall be retained for removal in accordance with applicable law.
- 9.3.8. All hazardous materials shall be handled, stored, and disposed of in accordance with an approved Hazardous Waste Materials Plan ("HWMP"). All spills shall be documented and reported to County Fire/OES and the County Certified Unified Program Agency as required by applicable law.
- 9.3.9. Any Fire Mitigation Payments set out in the CUP are separate from the payments required under this section.
10. **VALUE OF PAYMENTS.** In addition to other provisions of this Agreement, all payments referenced in this Agreement shall escalate annually beginning on January 1, 2023, based upon the Consumer Price Index – Los Angeles SMSA – all urban consumers ("CPI"), but in no case shall the CPI be less than zero (0).
11. **EMINENT DOMAIN.** The Parties to this Agreement understand and acknowledge that County has no present or foreseeable future need to acquire public access to the Project not already authorized under the CUP and/or County-issued entitlements for this Project. However, should a future need arise in which County requires additional public access to the Project, County shall, before engaging in any eminent domain proceedings, meet and negotiate in good faith with Developer concerning the proposed public access to the Project.
12. **PERIODIC REVIEW.**
- 12.1. County shall review the extent of good faith compliance by Developer with the terms of this Agreement at least every twelve (12) months pursuant to California Government Code section 65865.1.

- 12.2. Upon written request from the County, Developer shall have the duty to demonstrate its good faith compliance with the terms of this Agreement.
- 12.3. Any County failure to annually review Developer's compliance with the terms and conditions of this Agreement shall not constitute or be asserted by County or Developer to be a breach or default of the Agreement, and shall not be used as grounds to amend, modify, alter, or terminate the Agreement.
13. **ASSIGNMENT AND DELEGATION.** As set out here, Developer may sell, transfer, or assign (collectively, "assign") all or part of Developer's rights, title and interest in the Project. This Agreement shall be binding on all successors in interest of the Developer pursuant to County of Imperial Codified Ordinances Code Section 92325.
- 13.1. **Partial Assignment.** When one or more CUP is assigned, but the assignment is of less than the entire Project area, the assignment is referred to herein as a "partial assignment." The assignment, including but not limited to any partial assignment, shall expressly include the assignment and assumption of all rights, duties, and obligations arising under or from this Agreement, other County-issued entitlements and the MMRP applicable to the CUP. There shall be no assignment of less than the entire CUP area, and any such attempted assignment is void.
- 13.2. Developer shall not, without prior notification to the Imperial County Planning and Development Services Department, assign, sell, transfer, or grant control of the Project, or any right or privilege therein granted by the CUP. The Developer shall provide a minimum of forty-five (45) days written notice prior to any proposed transfer becoming effective. An approved assignment agreement shall be in place for the new Project owner to build and maintain as agreed to by the conditions set forth in this Agreement. The County Assessor's Office shall be notified of any ownership change.
- 13.3. Within fifteen (15) calendar days after an assignment: (1) Developer shall notify the County, in writing, of such assignment and shall provide County with both: (a) an executed copy of the assignment evidencing that the assignee expressly assumes all the assigned duties and obligations of Developer under this Agreement, other County-issued entitlements, and the MMRP applicable to the CUP area; and (b) Developer's requested form of release of such duties and obligations related to that CUP area; (2) assignee shall provide County with the assignee's financial security equal in value to the financial security required of Developer by the Project entitlements including any and all entitlement-required increases to secure performance of its obligations with respect to the portion of the Project assigned, including but not limited to that for the decommissioning and reclamation plan; and (3) Developer and/or assignee shall provide any and all additional information necessary to determine the sufficiency of such replacement financial security. As used here "financial security" may mean one or more security instruments which can include letters of credit, performance bonds, or other forms of security

consistent with those previously accepted by the County for this or other development projects in the County.

- 13.4. Within forty-five (45) calendar days of delivery of the information required under Paragraph 13.3, the County Planning and Development Services Department shall determine the sufficiency of the replacement security in its reasonable discretion, which can include letters of credit, performance bonds, or other forms of security consistent with those previously accepted by the County for this or other development projects. The County shall have the discretion to require security having a greater value (i.e. a larger face amount) than the security being replaced related to that CUP area when such security is subject to increase pursuant to the provisions of the CUP. Notwithstanding the failure of any assignee to execute the assignment or provide the required security, the burdens of this Agreement shall be binding upon such assignee, but the benefits of this Agreement shall not inure to such assignee until and unless such assignment is executed, and such security is provided and the County has delivered a written release to Developer confirming the sufficiency of the replacement security.
- 13.5. Notwithstanding any sale, transfer, or assignment, Developer shall continue to be obligated under this Agreement until the County executes a release of such financial security. The County's unreasonable failure to approve the assignment or execute such release may be a default under Section 18 of this Agreement.
- 13.6. County shall be reimbursed by Developer for any costs of review of the replacement financial security instrument(s).
14. **RELATIONSHIP OF COUNTY AND DEVELOPER.** The contractual relationship between County and Developer arising out of this Agreement does not create an agency relationship.
15. **INDEMNIFICATION AND HOLD HARMLESS.**
  - 15.1. Developer shall indemnify and shall hold the County, its officers, agents, attorneys and employees harmless from third-party liability, claims, demands, expenses or costs, including but not limited to costs of experts and separate attorneys chosen by County at County's sole discretion: (1) to attack, set aside, void or annul this Agreement, any entitlement, CUP, approval or the certification of any environmental document accompanying such entitlements, or any determination made under such CUP or this Agreement, whether there is concurrent, passive, or active negligence on the part of the County, its officers, agents, attorneys, or employees; or (2) for personal injury (including but not limited to death), property damages, just compensation, judicial or equitable relief, arising or alleged to arise from the direct or indirect operations of the Developer or its contractors, subcontractors, agents, employees, or other persons acting on Developer's behalf that relate to the Project (including but not limited to Developer's actions or failure

to act in drilling, grading, construction, operation, abandonment, reclamation or decommissioning) of the Project or any CUP.

**15.2.** Developer shall execute County's most current form of indemnification funding agreement. County and Developer shall cooperate in the defense against claims subject to these indemnities and Developer shall enter into the applicable form of agreement to confirm such joint defense. Notwithstanding, Developer's failure to provide payment of any fees or costs required under this Agreement shall cause Developer to be in non-compliance with this Agreement. Upon notification of such non-compliance, County may, at its sole discretion, cease processing of the Project or defending any lawsuit or paying for costs associated with the Project.

**16. AMENDMENT OR CANCELLATION.** This Agreement may be amended or canceled by the mutual consent of County and Developer, in the manner set forth in California Government Code section 65868 and County of Imperial Codified Ordinances Sections 92306.00 and 92306.01.

**17. MINOR MODIFICATION.** Unless as otherwise required by law (including but not limited to the County of Imperial Codified Ordinances) interpretations and minor modifications or changes can be made to the Project with the mutual agreement of Developer and the County's Planning Director, only in one (1) of the following circumstances:

**17.1.** Where the change is: (i) ministerial or mutually agreeable to the County's Planning Director and Developer; (ii) constitutes an administrative interpretation or less than significant amendment; (iii) constitutes a change or technical modification to the design, construction, and/or operation of the Project under the existing applicable rules, regulations, and laws of the County; or (iv) amends the CUP to allow development and operation of the Project subject to two or more CUPs, provided that the subsequent CUPs shall be bound by the effective date and term of the original CUP, and does not:

**17.1.1.** Alter the permitted uses of the Property as a whole or within any CUP;

**17.1.2.** Increase the density or intensity of use of the Property as a whole or within any CUP;

**17.1.3.** Increase the maximum height and size of permitted buildings or structures;

**17.1.4.** Delete a requirement for the reservation or dedication of land for public purposes within the Property as a whole;

**17.1.5.** Conflict with a condition of approval or MMRP provision; or

17.1.6. Constitute a discretionary approval by the County for which a subsequent or supplemental environmental impact report would be required pursuant to Section 21166 of the California Public Resources Code.

17.2. Where the change is ministerial, mutually agreeable to County and Developer, and constitutes an administrative interpretation, less than significant amendment, or change or technical modification to the design, construction, and/or operation of the Project under the existing applicable rules, regulations, and laws of non-County agencies as to Project matters within their sole jurisdiction.

18. **DEFAULT.** A default under this Agreement shall be deemed to have occurred upon the happening of one or more of the following events or conditions:

18.1. A warranty, representation, or statement made or furnished in this Agreement by either Party proves to have been false in any material respect when it was made.

18.2. A finding by County pursuant to County of Imperial Codified Ordinances Sections 92308.00 and 92308.01, based on substantial evidence, that the Developer has not complied in good faith with one or more of the terms or conditions of this Agreement.

18.3. Any other act or omission by either Party which breaches or materially interferes with the terms of this Agreement.

18.4. A default under this Agreement with respect to obligations owed to the County by the Developer shall not constitute a default under this Agreement to the extent this Agreement has been partially assigned to another entity in accordance with Section 13, and a default under this Agreement with respect to obligations owed to the County by an assignee of a portion hereof in accordance with Section 13 shall not constitute a default under this Agreement by the Developer.

19. **PROCEDURE UPON DEFAULT.**

19.1. Upon the occurrence of default by Developer or County, prior to any proceedings pursuant to Title 9, Division 23 of the County of Imperial Codified Ordinances, and as an informal resolution procedure prior to any litigation being filed (including but not limited to any breach of contract action), the non-defaulting party shall provide the other party written notice specifying the nature of the alleged default and the actions required to cure such default. Such notice shall not be required in the event the default creates a threat to public health and safety.

19.2. After proper notice, the non-defaulting Party has the option to terminate the Agreement if: (1) the defaulting Party fails to take such actions or otherwise cure such default within forty-five (45) calendar days after the receipt of such notice; or (2) in the event that such default cannot be cured within such forty-five (45) calendar day period but can be cured within a longer time, the defaulting party fails

in such forty-five (45) day period to commence the actions necessary to cure such default and to diligently proceed to complete such actions and cure such default.

- 19.3. All other remedies at law or in equity which are not inconsistent with the provisions of this Agreement are available to County and Developer to pursue in the event there is a default.
20. **LEGAL ACTION.** Either Party may institute legal action to cure, correct, or remedy any default, to enforce any covenant or agreement herein, to enjoin any threatened or attempted violation, or to compel specific performance. In no event shall County or its officers, employees or agents be liable in damages for any breach of this Agreement, it being expressly understood and agreed that the sole remedy available to Developer for a breach of this Agreement by County shall be a legal action in mandamus, specific performance (including the return of protested fees or other payments), injunction or declaratory relief to enforce the Agreement.
21. **ATTORNEYS' FEES.** In the event any legal action is brought to enforce or construe this Agreement, the prevailing Party shall be entitled to an award of reasonable attorneys' fees, expert witness and consulting fees, and litigation costs.
22. **DISCRETION TO ENCUMBER.** This Agreement shall not prevent or limit Developer from encumbering the Property, or any improvement on the Property, by any mortgage, deed of trust, or other security device.
23. **ENTIRE AGREEMENT; WAIVER AND RECORDED STATEMENT.** This Agreement constitutes the entire understanding and agreement of County and Developer with respect to the matters set forth in this Agreement. This Agreement supersedes all negotiations or previous agreements between County and Developer respecting this Agreement. Any County waivers of the provisions of this Agreement must be authorized by the terms of this Agreement or by County ordinance, and approved as set out therein. Any waiver by Developer shall be in writing. No waiver of any term or condition of this or any determination of a protest hereunder shall be a continuing waiver or determination hereunder. Upon the completion of performance of this Agreement, or its revocation or termination, a statement evidencing completion, revocation, or termination signed by the appropriate agents of County shall be recorded in the Official Records of Imperial County, California.
24. **NOTICES.**
- 24.1. All notices or deliveries required or provided for by this Agreement shall be in writing and delivered in person or sent by certified mail, postage prepaid, return receipt requested, to the following:

- 24.2. County or Developer may change its address by giving notice in writing to the other Party. All notices or deliveries shall be deemed to have been given when received.
25. **CAPTIONS.** The captions of this Agreement are for convenience and reference only and shall not define, explain, modify, construe, limit, amplify, or aid in the interpretation, construction, or meaning of any provision of this Agreement.
26. **RECORDING.** The Clerk of the Board shall cause a copy of this Agreement to be recorded with the Office of the County Recorder of Imperial County, California, within ten (10) days following the execution of this Agreement, pursuant to California Government Code section 65868.5.
27. **INTERPRETATION AND GOVERNING LAW.** This Agreement and any dispute arising hereunder shall be governed and interpreted in accordance with the laws of the state of California.
28. **VENUE.** In the event of any legal or equitable proceeding arising out of or relating to this Agreement, the Parties agree that venue shall lie only in the federal or state courts located in the County of Imperial.

29. **TIME OF ESSENCE.** Time is of the essence in the performance of the provisions of this Agreement as to which time is an element.
30. **UNENFORCEABLE PROVISIONS.** The terms, conditions, and covenants of this Agreement shall be construed, whenever possible, as consistent with applicable laws and regulations. To the extent that any provision of this Agreement as so interpreted is held to violate any applicable law or regulation, the remaining provisions shall nevertheless be carried into full force and effect and remain enforceable.
31. **REPRESENTATION OF CAPACITY TO EXECUTE CONTRACT.** Each Party to this Agreement represents and warrants that the person or persons signing have the authority to execute this Agreement on behalf of the Party represented by those individuals.
32. **NO WAIVER.** The failure of either Party to enforce any term, covenant, or condition of this Agreement on the date it is to be performed shall not be construed as a waiver of that Party's right to enforce this or any other term, covenant, or condition of this Agreement at any later date, or as a waiver of any term, covenant, or condition of this Agreement.
33. **COUNTERPARTS.** This Agreement may be executed by the Parties in counterparts, which counterparts shall be construed together and have the same effect as if all the Parties had executed the same instrument.
34. **FORCE MAJEURE.** Neither Party shall be deemed to be in default where failure or delay in performance of any of its obligations is beyond its reasonable control, such as, floods, earthquakes, acts of God, fires, wars, riots or similar hostilities, strikes, and other labor difficulties. Economic factors shall not be considered beyond the reasonable control of a Party.
35. **GENDER, NUMBER AND INTERPRETATION.** As used herein, the neutral gender includes the masculine and feminine, the feminine gender includes the masculine, and the masculine gender includes the feminine. As used herein, the singular of any word includes the plural. In the event of an ambiguity, there shall be no presumption against the drafter, all Parties hereto being represented by counsel.
36. **FURTHER COOPERATION.** Each of the Parties shall cooperate with and provide reasonable assistance to the other to the extent contemplated hereunder in the performance of all obligations under this Agreement, and the satisfaction of the conditions of this Agreement. Upon the request of either Party at any time, the other Party shall promptly execute with acknowledgment or affidavit (if reasonably required) and file or record such required instruments and writings and take any actions as may be reasonably necessary under the terms of this Agreement to carry out the intent and fulfill the provisions of this Agreement, or to evidence or consummate the transactions contemplated by this Agreement. Notwithstanding the foregoing sentence, if Developer delivers to County a written request for an estoppel certificate confirming that there is no default under this Agreement, that this Agreement is in full force and effect, or that this Agreement has not been amended, then the County shall use its best efforts to respond within twenty (20)

calendar days of the provision of such estoppel certificate and all necessary supporting information for such issuance.

37. **SURVIVAL.** Developer's payment obligations to County as specified in Sections 9 and 10 shall survive the expiration or termination of this Agreement.

[Signatures on Following Page]

**IN WITNESS WHEREOF**, the Parties have notarized and executed this Agreement as of the Effective Date stated in this Agreement as authorized by Ordinance No. \_\_\_\_\_ of the Board of Supervisors of the County of Imperial.

**G. General Plan  
Amendment  
(GPA#19-0003)**

**RESOLUTION NO. \_\_\_\_\_**

**A RESOLUTION OF THE PLANNING COMMISSION OF  
THE COUNTY OF IMPERIAL, CALIFORNIA,  
RECOMMENDING APPROVAL TO THE IMPERIAL  
COUNTY BOARD OF SUPERVISORS THE GENERAL  
PLAN UPDATE FOR THE WESTSIDE CANAL BATTERY  
ENERGY STORAGE PROJECT.**

WHEREAS, the applicant Consolidated Edison Development Inc. (CED) filed a request for a General Plan Amendment GPA #19-0003 requesting a General Plan change parcels APN: 050-350-010 & 051-350-011-000 to an Industrial Designation for the proposed Westside Canal Battery Energy Storage project and,

**WHEREAS**, the Planning Commission of the County of Imperial has been delegated with the responsibility of making recommendations to the Imperial County Board of Supervisors regarding a General Plan Amendment for approval and,

**WHEREAS**, the General Plan Amendment (GPA) has been provided in a timely manner to public agencies; and

**WHEREAS**, timely public notice of the Planning Commission's hearing on the Project application has been given, and the Planning Commission has considered evidence presented by the Imperial County Planning & Development Services Department and other interested parties at that public hearing held with respect to this item on October 13, 2021 and,

**WHEREAS**, the General Plan Amendment will include the update & revision to the Imperial County Title 9, Division 25 Map #40 (Westside School Area) to include from an Agriculture Designation to an Industrial Designation for the Westside Canal Battery Energy project site

**NOW THEREFORE**, the Planning Commission of the County of Imperial **DOES HEREBY RESOLVE** as follows:

**SECTION 1.** The Planning Commission independently has reviewed and considered the proposed General Plan Amendment GPA #19-0003 prior to making a decision to recommend that the Board of Supervisors to approve this General Plan Amendment (GPA #19-0003). The Planning Commission finds and determines that the Environmental Impact Report is adequate and prepared in accordance with the requirements of the California Environmental Quality Act (CEQA), which analyzes environmental effects, based upon the following findings and determinations.

**SECTION 2.** That in accordance with, CEQA, State Planning and Zoning law and the County of Imperial Land Use Ordinance, the following findings for the

recommendation for approval and certification of the General Plan Amendment (GPA) #19-0003 have been made as follows:

1. That the Final Project EIR **SCH# 2020040122**, Candidate CEQA Findings for the Westside Canal Battery Energy ("Project") have been prepared in accordance with the requirements of the California Environmental Quality Act, the State CEQA Guidelines, and the County's Rules to Implement CEQA as amended, and such findings are incorporated by reference herein
2. That the County independently has reviewed, analyzed, and considered the Final Project EIR, the environmental impacts therein identified for this Project, the Candidate CEQA Findings, and the Mitigation Monitoring and Reporting Program, and the entire Record of Proceedings prior to recommending approval of this project.
3. The General Plan Amendment (map #40 revision) for the Westside Canal Battery Energy project is consistent with the Imperial County General Plan
4. The project area is mostly flat outside of earthquake fault zones and is physically suitable for the proposed project.
5. The General Plan Amendment is not likely to cause substantial environmental damage or substantially and avoidably injure fish or wildlife or their habitat. Surveys have been accomplished for biological and fish and impacts are less than significant with required mitigation.
6. The development and improvements are not likely to cause serious health problems.

**NOW, THEREFORE**, based on the above findings, the Planning Commission of the County of Imperial **DOES HEREBY RECOMMEND** that the Board of Supervisors approve the proposed General Plan Amendment GPA #19-0003, for the Westside Canal Battery Energy Storage ("Project").

# **H. Zone Change (ZC#19-0004)**

## **RESOLUTION NO.**

**A RESOLUTION OF THE PLANNING COMMISSION OF THE COUNTY OF IMPERIAL, CALIFORNIA, FOR THE RECOMMENDATION TO THE BOARD OF SUPERVISORS FOR AN APPROVAL OF A ZONE CHANGE TO CHANGE THE ZONING CLASSIFICATION FROM "A-3" (HEAVY AGRICULTURE)" TO M-2 " MEDIUM INDUSTRIAL" WITH (ZONE CHANGE #19-0004) AND FOR THE ADOPTION OF CHANGE TO THE ZONE CHANGE CODIFIED ORDINANCE.**

**WHEREAS**, Project Applicant: CED WESTSIDE CANAL BATTERY STORAGE, LLC has filed an application to re-zone parcels 052-350-010-000 & 051-350-011-000 from an A-3 Heavy Agriculture zone to "Medium Industrial" zone. Westside Canal Battery Energy project area is mostly bounded on the north and east side by the West Main Canal and on the south side by the Campo Verde Solar development currently in operation.

**WHEREAS**, the Planning Commission of the County of Imperial has been delegated with the responsibility of making a recommendation to the Board of Supervisors on a decision for changes to Zoning Map No.40 Westside School area; and

**WHEREAS**, public notice of said application has been given, and the Planning Commission has considered evidence presented by the Imperial County Planning & Development Services Department and other interested parties at a public hearing held with respect to this item on October 27, 2021.

**NOW THEREFORE**, the Planning Commission of the County of Imperial **DOES HEREBY RESOLVE** as follows:

**SECTION 1.** The Planning Commission has considered the proposed Zone Change No. 19-0004, prior to making a recommendation to the Board of Supervisors on a decision for the proposed amendment to the Zoning Map #40. Planning Commission finds and determines that the Environmental Impact Report is adequate and prepared in accordance with the requirements of the California Environmental Quality Act (CEQA), which analyzes environmental effects, based upon the following findings and determinations.

**SECTION 2.** That in accordance with State Planning and Zoning law and the County of Imperial General Plan and zoning ordinances, the following findings for the approval of Zone Change No. 19-0004 have been made as follows:

1. The proposed Zone Change has been analyzed relative to its potential to be detrimental to the health, safety, comfort and welfare of the persons residing or working within the neighborhood of the proposed Zone Change. Staff concluded

**PLANNING COMMISSION RESOLUTION FOR  
ZONE CHANGE NO. 19-0004**

**Page 2 of 3**

that the project does not propose land uses, densities, or development patterns that will jeopardize the health and safety of the persons residing or working within the neighborhood of the property. Health, safety, and welfare will not be degraded as a result of this project.

2. The Zone Change to M-2 Medium Industrial will be consistent with the General Plan's land use Designation of Industrial.
3. The proposed M-2 Medium Industrial zone, subject to this recommendation, is consistent with the uses allowed by Imperial County's Land Use Ordinances 90516-02 for properties in the aforementioned zones, provided that the applicant obtains a conditional use permit. County Ordinances No. 90516.02 represent the county's long-standing determination that conditionally approved battery storage projects are consistent with the M-2 zone.
4. The site physically is suitable of this type of development and zoning. The project site consists of generally flat terrain with very gentle topography.
5. The change of zone will not conflict with any easements required by the public at large for access through or use of the property with the proposed zone change. Several easements surround and traverse the area. The Imperial Irrigation District (IID) owns several easements associated with existing canal, drains and electrical lines. The easements and their associated facilities will be retained, vacated or realigned as appropriate.
6. The change of zone is also consistent with the General Plan Land Use Element goals and objectives, including objectives to "[d]iversify employment and economic opportunities in the County while preserving agricultural activity" (Goal 2) and to "[p]reserve agriculture and natural resources while promoting diverse economic growth through sound land use planning" (Goal 3, Objective 3.2).
7. Economic Impact Analyses, Employment (Jobs) Impact Analyses and Fiscal Impact Analyses prepared demonstrated that in addition to other economic benefits (construction jobs, fee payments, etc.), battery storage facility will employ full-time employees compared the existing vacant land which hasn't been farmed in a number of years. The Project appears to have a clear long term economic benefit to the County.

**NOW, THEREFORE**, based on the above findings, the Planning Commission of the County of Imperial DOES HEREBY recommend for the Board of Supervisors to approve the proposed Zone Change #19-0004 to rezone from the current zoning of A-3 Heavy Agriculture to M-2 Medium Zone" and approve the proposed change to the Imperial County Codified Zoning Ordinance.

Ordinance No. \_\_\_\_\_

**AN ORDINANCE AMENDING THE CODIFIED ORDINANCES OF  
THE COUNTY OF IMPERIAL RELATING TO ZONES**

The Board of Supervisors of the County of Imperial, State of California, ordain as follows:

**SECTION 1:** The map entitled "Westside School Area" Zoning Map No. 40 (Section 92540.01 of the Codified Ordinances) is hereby amended in the following particular only.

Section **92540.01** Amendment to Zoning Map No. 40 "Westside School Area" Zone Change ZC 19-0004" Westside Canal Battery Energy".

The zone classification of those certain parcels of real property situated in the County of Imperial, State of California, and more particularly described as:

**LEGAL DESCRIPTION:** South ½ of Southeast ¼ Section 34 Township 16 South, Range 12 East 80 acres; & POR Northeast ¼ & Southwest ¼ & North ½ of Southeast ¼ Section 34 Township 16 South, Range 12 East, South of Westside 68 Acres AC. **051-350-010-000 & 051-350-011-000.**

**"A-3" (Heavy Agriculture) zone change to "M-2" (Medium Industrial).**

---

**SECTION 2:** This Ordinance shall take effect thirty (30) days after the date of its adoption and prior to the expiration of fifteen (15) days from the passage thereof, shall be published at least once in a newspaper of general circulation printed and published in the County of Imperial, State of California, together with the names of the Board of Supervisors voting for and against the same.

**SECTION 3:** That in accordance with State Planning and Zoning law and the County of Imperial General Plan and zoning ordinances, the following findings for the approval of Zone Change No. 19-0004 have been made as follows:

1. The proposed Zone Change has been analyzed relative to its potential to be detrimental to the health, safety, comfort and welfare of the persons residing or working within the neighborhood of the proposed Zone Change. Staff concluded that the project does not propose land uses,

densities, or development patterns that will jeopardize the health and safety of the persons residing or working within the neighborhood of the property. Health, safety, and welfare will not be degraded as a result of this project.

2. The Zone Change is consistent with the General Plan's underlying land use overlay designation of Renewable Energy (RE). The Zone Change will allow for the development of a Battery Storage Energy facility.
3. The proposed zone change to an M-2 Medium Industrial zone site subject to this recommendation is consistent with the uses allowed by Imperial County's Land Use Ordinances 90516.02 for properties in the aforementioned zones, provided that the applicant obtains a conditional use permit.
4. The site physically is suitable of this type of development and zoning. The project site consists of generally flat terrain with very gentle topography.
5. The change of zone will not conflict with any easements required by the public at large for access through or use of the property with the proposed zone change. Several easements surround and traverse the area. The Imperial Irrigation District (IID) owns several easements associated with existing canals, drains and electrical lines. The easements and their associated facilities will be retained, vacated or realigned as appropriate.
6. The change of zone is also consistent with the General Plan Land Use Element goals and objectives, including objectives to "[d]iversify employment and economic opportunities in the County while preserving agricultural activity" (Goal 2) and to "[p]reserve agriculture and natural resources while promoting diverse economic growth through sound land use planning" (Goal 3, Objective 3.2).
7. Economic Impact Analyses, Employment (Jobs) Impact Analyses and Fiscal Impact Analyses prepared for this project has demonstrated that in addition to other economic benefits (construction jobs, fee payments, etc.), renewable energy projects offer "fiscal benefits from increased economic activity and local employment opportunities that do not threaten the economic viability of other industries." The conclusion is that the Project will have a clear long-term economic benefit to the County.

**PASSED, ADOPTED AND APPROVED** by the Board of Supervisors of the County of Imperial this \_\_\_\_\_.

PASSED, ADOPTED, AND APPROVED by the Board of Supervisors of the  
County of Imperial this \_\_\_\_\_ day of \_\_\_\_\_, 2021.

# Westside Canal Battery Energy Project ZC #19-0004

---

# **I. Conditional Use Permit (CUP#19-0015)**

**RESOLUTION NO. \_\_\_\_**

**A RESOLUTION OF THE PLANNING COMMISSION OF THE COUNTY OF IMPERIAL, CALIFORNIA, RECOMMENDING APPROVAL FOR "CONDITIONAL USE PERMIT CUP 19-0015" FOR WESTSIDE CANAL BATTERY ENERGY PROJECT**

**WHEREAS,** CED Westside Canal Battery Storage, LLC has submitted an application for Conditional Use Permit #19-0015 for the construction, operation, maintenance and decommissioning of battery storage energy facility(s) (CUP #19-0015) is referred to in this Resolution as the Project);

**WHEREAS,** an Environmental Impact Report and CEQA Findings have been prepared in accordance with the requirements of the California Environmental Quality Act, the State Guidelines, and the County's "Rules and Regulations to Implement CEQA," as Amended;

**WHEREAS,** the Planning Commission of the County of Imperial has been delegated with the responsibility of approvals, certifications and making recommendations to the Imperial County Board of Supervisors for approvals of conditional use permits;

**WHEREAS,** public notice of said application has been given, and the Planning Commission has heard, received and considered all oral and written protests, objections and evidence presented by interested parties at a public hearing held with respect to this item on October 13, 2021; and

**WHEREAS,** the Draft EIR was received by the State Clearinghouse on April 7, 2021 and circulated for a period of 50 days ending on May 27, 2021. (SCH# 2020040122).

**NOW, THEREFORE,** the Planning Commission of the County of Imperial **DOES HEREBY RESOLVE** as follows:

**SECTION 1.** The Planning Commission has considered the proposed Conditional Use Permit #19-0015 prior to recommending approval and the County's consideration of the Project has been noticed in compliance with law.

**SECTION 2.** That the Project complies with the requirements of the Imperial County Code and is in accordance with State Planning and Zoning law therefore, the following findings are made pursuant to Imperial County Code § 90203.09 as follows:

**A. The proposed use is consistent with goals and policies of the adopted County General Plan. (Imperial County Code § 90203.09.A)**

The General Plan goals and objectives serve as guidelines and policy statements. The County Board of Supervisors has the authority to interpret the meaning of its General Plan and determine whether the proposed project is consistent

1. The General Plan designates the subject site as "Industrial." Sections 90516.02 of the County Land Use Ordinance identify the permitted and conditional uses within the M-2, zoning designations. Uses identified as conditionally permitted require a Conditional Use Permit (CUP), which is subject to the discretionary approval of the County Board of Supervisors (Board) per a recommendation by the County Planning Commission.
2. The Planning Commission finds that the evidence in the record demonstrates that the Project does not conflict with any existing agricultural operations and will not result in the premature elimination of agricultural operations. The proposed General Plan Amendment from Agriculture to Industrial and the proposed zoning change from A-2 General Agriculture to M-2 Medium Industrial is also consistent with the General Plan Land Use Element goals and objectives, including objectives to "[d]iversify employment and economic opportunities in the County while preserving agricultural activity" (Goal 2) and to "[p]reserve agriculture and natural resources while promoting diverse economic growth through sound land use planning" (Goal 3, Objective 3.2). Further, the Project applicant will be required to submit to Imperial County a site-specific decommissioning and reclamation plan capable of restoring the site.
3. Pursuant to SB 2X, California utilities have been mandated to obtain 33% of their energy from renewable sources (wind, solar, geothermal, biofuels, etc.) by 2020. The County General Plan actively promotes both alternative energy and opportunities for economic growth. For example, Goal 1 of the Geothermal/Alternative Energy and Transmission Element ("Alternative Energy Element") provides that the County "supports and encourages the full, orderly, and efficient development of geothermal/alternative energy resources while at the same time preserving and enhancing where possible agricultural, biological, human, and recreational resources

4. The proposed use is also consistent with the County's goal of becoming a major source of renewable energy for California, and fulfill its mission to help California meet its statutory and regulatory goal of increasing renewable power generation, including greenhouse gas reduction goals of Assembly Bill (AB) 832 (California Global Warming Solutions Act of 2006). Imperial County is a major source of renewable energy for the State of California. One of the purposes of the Imperial Valley Renewable Energy Development Program is to "maximize development of all renewable energy resources." An objective of the Project is "to assist the State of California in achieving and exceeding the Renewable Portfolio Standard".
5. As summarized in the Goals and Objectives of the Renewable Energy and Transmission Element of the Imperial County General Plan (Goal 1), ".The County of Imperial supports and encourages the full, orderly, and efficient development of renewable energy resources while at the same time preserving and enhancing where possible agricultural, biological, human, and recreational resources Therefore, the proposed project will be compatible with the objectives, policies, general land uses and programs specified in the applicable plan." *Id.* (internal quotations and citations omitted).
6. Battery storage and energy projects provide economic growth to the region and economic benefit to the County and Goal 2 of the Land Use Element states that the County should "[d]iversify employment and economic opportunities in the County while preserving agricultural activity". Goal 3, Objective 3.2 of the Land Use Element recognizes the need to "[p]reserve agricultural and natural resources while promoting diverse economic growth through sound land use planning.

**B. The proposed use is consistent with the purpose of the zone or sub-zone within which the use will be used. (Imperial County Code § 90203.09.B)**

The purpose of the project is for the construction of a battery energy project. Pursuant to Title 9, Division 5, Chapter 16, "Battery Storage and Major facilities relating to the generation and transmission of electrical energy" are uses that are permitted in the M-2 Medium Industrial zones subject to approval of a CUP from the County. The proposed Project site is zoned M-2. The purpose of these zones is to designate areas that are suitable for industrial uses, as well as areas that support other compatible uses consistent with the identified permitting

requirements. Therefore, the proposed use is consistent with the purpose of the zone or sub-zone within which the use will be located.

- C. The proposed use is listed as a use within the zone or sub-zone or is found to be similar to a listed conditional use according to the procedures of Section 90203.00. (Imperial County Code § 90203.09.C)**

The proposed solar facility is listed as a use subject to a Conditional Use Permit in Land Use Ordinance, Sections 90516.02. Battery Storage and Major Facilities relating to the generation and transmission of electrical energy

- D. The proposed use meets the minimum requirements of this Title applicable to the use and complies with all applicable laws, ordinances and regulations of the County of Imperial and the State of California. (Imperial County Code § 90203.09.D)**

The Project complies with the minimum requirements of this Title by, among other things, obtaining a CUP, complying with the California Environmental Quality Act, and participating in the public review and hearing process. Development standards have been established for the Project pursuant to these processes, and will be enforced via imposition and enforcement of the Mitigation Monitoring and Reporting Program recommended for approval by separate Resolution, as well as the Conditions of Approval imposed on this CUP. The Conditions of Approval will further insure that the project complies with all applicable regulations of the County of Imperial and the State of California. Therefore, the proposed project will meet the minimum requirements of the Land Use Ordinance, Section 90203.00.

- E. The proposed use will not be detrimental to the health, safety, and welfare of the public or to the property and residents in the vicinity. (Imperial County Code § 90203.09.E)**

The battery energy facility is located in a largely undeveloped and unincorporated portion of the southwest portion of Imperial County. The propose Westside Canal Battery Energy project consists of previously farmed lands. Noise associated with solar panel operation would also meet the County's noise ordinance requirements at the Project's property lines. The Environmental Impact Report prepared for the Project analyzed the Project's potential effects on the health, safety, and welfare of the public and property and found that, with mitigation, the Project has less than significant effects in all resources areas.

Finally, the Project applicant has agreed to conditions of approval that support and promote the protection of the health, safety, and welfare of the County's citizens and property, and ensures that the County will not be negatively impacted environmentally or fiscally.

**F. The proposed use does not violate any other law or ordinance. (Imperial County Code § 90203.09.F)**

The proposed project will be subject to the Conditional Use Permit and current Federal, State and Local regulations. State Planning and Zoning Law (Cal. Govt. Code §§ 65000-66035) establishes minimum statewide standards for the regulation of local land use through planning and zoning. The County regulates local land use via Title 9 of the Imperial County Code. As found above, the proposed project is conditioned to be consistent with Imperial County, Title 9, Land Use Ordinance and CEQA mitigation measures and therefore complies with both State and local laws and ordinance. Pursuant to CEQA, the County has prepared an EIR for the Project, which EIR analyzes the Project's compliance and consistency with other federal, state, and local laws and ordinances regulating the environment. .

**G. The proposed use is not granting a special privilege. (Imperial County Code § 90203.09.G)**

The Battery energy facility is a permitted use subject to approval of a Conditional Use Permit under Land Use Ordinance, Section 92102.00 *et. seq.* The proposed use is and will not granting a special privilege because the County has granted similar CUPs to properties in the area for PV solar energy facility.

**SECTION 3.** Approval of the Project should be conditioned upon the terms and conditions set forth in the Agreement for Conditional Use Permit No. 19-0015, attached hereto and incorporated herein by this reference.

**NOW, THEREFORE,** based on the above findings, the Imperial County Planning Commission **DOES HEREBY RECOMMEND APPROVAL OF** Conditional Use Permit #19-0015 to the Board of Supervisors, subject to the attached Conditions of Approval.

When Recorded Return To:

Imperial County  
Planning & Development Services  
801 Main Street  
El Centro, California 92243

**"DRAFT" AGREEMENT FOR  
CONDITIONAL USE PERMIT # 19-0015  
WESTSIDE CANAL BATTERY STORAGE PROJECT  
APN: 051-350-010, 051-350-011, 051-350-009, 051-350-019, 051-350-018  
PLANNING COMMISSION (October 13, 2021)**

This Agreement is made and entered into on this \_\_\_\_ day of \_\_\_\_\_, 2021, by and between Consolidated Edison Development Inc. (CED), hereinafter referred to as the Permittee ("Permittee"), and the COUNTY OF IMPERIAL, a political subdivision of the State of California, (hereinafter referred to as "COUNTY") related to the Westside Canal Battery Storage Project.

**RECITALS**

**WHEREAS**, Permittee is the lessee or successor-in-interest of certain land in Imperial County to develop, design, construct, own, operate, and maintain, and eventually decommission the CED Westside Canal Battery Storage Project, a utility-scale energy storage complex with the capacity of up to 2,000 Megawatts (MW) at full build-out. The proposed Project would store energy generated from the electrical grid, and optimally discharge that energy back into the grid as a firm, dispatchable resource.

**WHEREAS**, the land use entitlement for this Project includes a Water Supply Assessment (WSA), a General Plan Amendment (GPA#19-0003), a Zone Change (ZC#19-0004), a Conditional Use Permits (CUP #19-0015) for the development of the Westside Canal Battery Storage project.

**WHEREAS**, Permittee has applied to the County of Imperial for a Conditional Use Permit #19-0015. The project is generally located on approximately 163 acres of land in the unincorporated Mount Signal area of the County, approximately eight miles southwest of the City of El Centro and approximately 5 miles north of the U.S.-Mexico border. Assessor Parcel Numbers: 051-350-010, 051-350-011, 051-350-009, 051-350-019, 051-350-018.

**WHEREAS**, The Permittee for the Westside Canal Battery Storage Project shall fully comply with all of the terms and conditions of the Project as specified hereinafter within this Conditional Use Permit.

## **GENERAL CONDITIONS:**

The "GENERAL CONDITIONS" are shown by the letter "G". These conditions are conditions that are either routinely and commonly included in all Conditional Use Permits as "standardized conditions" and/or are conditions that the Imperial County Planning Commission has established as a requirement on all CUP's for consistent application and enforcement. The Permittee is hereby advised that the General Conditions are as applicable as the SITE SPECIFIC conditions. The General Conditions are in addition to the MMRP and any and all other requirements for the project.

---

### **G-1 GENERAL LAW and other Requirements:**

The Permittee shall comply with all local, state and/or federal laws, rules, regulations, ordinances, and/or standards (LORS) as they may pertain to the Project, whether specified herein or not. The Project shall be constructed and operated as described in the General Plan Amendment, Zone Change, Conditional Use Permit, and Development Agreement, the Environmental Impact Report (FEIR & DEIR) and Mitigation and Monitoring Reporting Program (MMRP). A violation of any such LORS or conditions, applications, the Development Agreement, the FEIR or the MMRP shall be a violation of this CUP. A violation of this CUP shall be considered a violation of the Development Agreement as well.

### **G-2 PERMITS/LICENSES:**

The Permittee shall obtain any and all local, state and/or federal permits, licenses, and/or other approvals for the construction and/or operation of the Project. This shall include, but not be limited to, local requirements by the Imperial County EHS/Health Department, Imperial County Planning and Development Services Department, Imperial County Air Pollution Control District (ICAPCD), Imperial Irrigation District (IID), Imperial County Public Works Department, Imperial County Sheriff/Coroner's office, Imperial County Fire Protection/Office of Emergency Services, among others. Permittee shall likewise comply with all such permit requirements. Additionally, Permittee shall submit a copy of such additional permits and/or licenses to the Imperial County Planning and Development Services Department within thirty (30) days of receipt, including amendments or alternatives thereto, when requested.

### **G-3 RECORDATION:**

This permit shall be recorded by County at the Imperial County Recorder's Office within ten (10) years within Development Agreement effective date, as set out in G-4. Upon termination of any CUP, Permittee shall record a release of such CUP within thirty (30) days of its termination. Permittee shall bear all recording costs.

Failure to reimburse County for such costs may be considered a violation of this CUP.

Recording is an action of notice and does not convey any rights to Permittee.

**G-4 DURATION OF DEVELOPMENT AGREEMENT:**

CUP19-0015 is part of an overall Development Agreement covering battery storage.

Pursuant to the terms of the Development Agreement, the CUP(s) may have up to a total permitted term of forty (40) years. The Development Agreement shall provide up to ten (10) years for the Conditional Use Permit to commence operations or commence construction. Upon commencement, the CUP shall have the remainder of any time left under the 10-year Development Agreement, plus an additional thirty (30) year term.

The Effective Date of this Development Agreement shall be the effective date of Ordinance No. \_\_\_\_\_. Unless sooner terminated under these conditions, any CUP in which construction has not commenced before or upon the tenth (10<sup>th</sup>) anniversary of the Effective Date shall terminate and be of no further force and effect. The Permittee covenants that any CUP not so commenced terminates on that tenth anniversary date. Such termination is consensual and shall not be subject to notice or a public hearing; such termination cannot be appealed to the Imperial County Planning Commission.

Notwithstanding, once commenced, the term of any CUP shall not exceed the combined total of forty (40) years from the Effective Date. On such date, CUP19-0015 shall terminate and be of no further force and effect. Such termination is consensual and shall not be subject to notice, public hearing or appeal to the Imperial County Planning Commission or Board of Supervisors.

As used here, "commence construction" or "Commencement of Construction" means the earlier of the date on which Developer obtains a grading permit or building permit, as may be applicable, in reliance on a CUP. Developer agrees that there shall be no vested right and no legal remedy available to Developer if such CUP terminates for failure to Commence Construction.

As used here, "commence construction" means the earlier of the date on which Permittee obtains a grading permit or building permit, as may be applicable, in reliance on a CUP.

Notwithstanding, the term of this Agreement may terminate sooner as provided herein or in the Development Agreement.

**G-5 INDEMNIFICATION:**

In addition to any other indemnifications provided for the Project, and as a condition of this permit, Permittee shall defend, indemnify, hold harmless, and release the County of Imperial ("County"), its agents, officers, attorneys, and employees (including consultants) from any claim, action, or proceeding brought against any of them, the purpose of which is to attack, set aside, void, or annul the approval this application or adoption of environmental document which accompanies it. This indemnification obligation shall include, but not be limited to, damages, costs, expenses, attorney fees, or expert witness fees that may be asserted by any person or entity, including the applicant, arising out of or in connection with the approval of this application, whether or not there is concurrent negligence on the part of the County, its agents, officers, attorneys, or employees (including consultants).

If any claim, action, or proceeding is brought against the County, its agents, officers, attorneys, or employees (including consultants), to attack, set aside, void or annul the approval of the application or adoption of the environmental document which accompanies it, then the following procedures shall apply:

1. The Planning Director shall promptly notify the County Board of Supervisors of any claim, action or proceeding brought by an applicant challenging the County's action. The County, its agents, attorneys and employees (including consultants) shall fully cooperate in the defense of that action.
2. The County shall have the final determination on how to best defend the case and will consult with applicant regularly regarding status and the plan for defense. The County will also consult and discuss with applicant the counsel to be used by County to defend it, either with in-house counsel, or by retaining outside counsel provided that the County shall have the final decision on the counsel retained to defend it. Applicant shall be fully responsible for all costs incurred. Applicant shall be entitled to provide his or her own counsel to defend the case, and said independent counsel shall work with County Counsel to provide a joint defense.

#### **G-6 INSURANCE:**

For the term of the CUP and any period thereafter for decommissioning and reclamation, the Permittee and/or Permittee's prime contractor assigned site control during construction, shall secure and maintain liability in tort and property damage, commercial liability and all risk builders' insurance at a minimum of **\$2,000,000 each, combined single limit property damage and personal injury**, to protect persons or property from injury or damage caused in any way by construction and/or operation of permitted facilities. Such insurance shall be endorsed to name the County, its officers, agents, and employees as additional insureds and shall be in a form and from a company acceptable to County. The Permittee shall require that proper Workers' Compensation insurance cover all laborers working on such facilities as required by the State of California. The Permittee and/or Permittee's prime contractor assigned site control during

construction, shall also secure liability insurance and such other insurance as may be required by the State and/or Federal Law. Evidence of such insurance shall be provided to the County prior to commencement of any activities authorized by this permit, e.g. an endorsed Certificate of Insurance is to be provided to the Imperial County Planning and Development Services Department by the insurance carrier and said insurance and certificate shall be kept current for the life of the permitted Project. Certificate(s) of Insurance shall be sent directly to the Imperial County Planning and Development Services Department by the insurance carrier and shall be endorsed to name the Department as a recipient of both renewal and cancellation notices.

#### **G-7 INSPECTION AND RIGHT OF ENTRY:**

The County reserves the right to enter the premises to make appropriate inspection(s) and to determine if the condition(s) of this permit are complied with. The owner or operator shall allow an authorized County representative access into the site upon the presentation of credentials and other documents as may be required by law to:

- (a) Enter at reasonable times upon the owner's or operator's premises where a permitted facility or activity is located or conducted, or where records must be kept under the conditions of the permit.
- (b) Have access to and copy, at reasonable times, any records that must be kept under the conditions of the permit.
- (c) Inspect at reasonable times any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under the permit.
- (d) Sample or monitor, at reasonable times, for the purpose of assuring permit compliance or, otherwise authorized by law, any substances or parameters at any location.

#### **G-8 SEVERABILITY:**

Should any condition(s) of this permit be determined by a Court or other agency with proper jurisdiction to be invalid for any reason, such determination shall not invalidate the remaining provision(s) of this permit.

#### **G-9 PROVISION TO RUN WITH THE LAND/PROJECT:**

The provisions of this Permit are to run with the land/project and shall bind the current and future owner(s), successor(s)-in-interest, assignee(s) and/or transferee(s) of said Project pursuant to the recordation required by Condition G-3. The permitted use identified herein is limited for use upon the permitted properties described herein and may not be transferred to any other parcel(s) without prior approval.

The Permittee shall pay any and all amounts determined by the County to defray any and all cost(s) for the review of reports, field investigations, monitoring, and other activities directly related to the enforcement/monitoring for compliance of this Conditional Use Permit, County Ordinance, MMRP or any other applicable law. All County Departments, directly involved in the monitoring/enforcement of this permit may bill Permittee under this provision; however, said billing shall only be through and with the approval of the Imperial County Planning and Development Services Department. All County staff time will be billed on a time and materials basis. Failure by Permittee to provide any payment required of Permittee to the County in the CUP shall cause Permittee to be in non-compliance of the CUP. Upon Permittee being in such noncompliance, County may, at its sole discretion, cease processing, defending any lawsuit or paying for costs associated with the Project.

- A. Assignment: Permittee shall not without prior notification to the Imperial County Planning and Development Services Department assign, sell or transfer, or grant control of Project or any right or privilege therein granted by this permit. The Permittee shall provide a minimum of forty-five (45) days written notice prior to any proposed transfer becoming effective. An approved assignment agreement shall be in place for new Project owner to build and maintain as agreed to by the conditions set forth in this CUP. The County Assessor's Office shall be notified of any ownership change.
- B. Thereafter, within fifteen calendar (15) days after any such assignment,
  - (1) Permittee shall notify the County, in writing, of such assignment and shall provide County with the following:
    - a. An executed copy of the assignment evidencing that the assignee expressly assumes all the assigned duties and obligations of Permittee under the CUP and Development Agreement, other County-issued entitlements and the MMRP applicable to the CUP area; and
    - b. Developer's requested form of release of such duties and obligations related to that CUP area;
    - c. Assignee must provide County with the assignee's security equal in value to the security required of Developer by the Project entitlements including any and all required increases to secure performance of its obligations with respect to the portion of the Project assigned, including but not limited to that for the decommissioning and reclamation plan; and
    - d. Permittee and/or assignee shall provide any and all additional information necessary to determine the sufficiency of such replacement security. As used here "security" may mean one or more security instruments.
- C. Within forty-five (45) calendar days of delivery of such information, the County Planning and Development Services Department shall determine

the sufficiency of the replacement security in its reasonable discretion, which can include letters of credit, performance bonds, or other forms of security consistent with those previously accepted by the County for this or other solar projects. The County shall have the discretion to require security having a greater value (i.e. a larger face amount) than the security being replaced related to that CUP area when such security is subject to increase pursuant to the provisions of the CUP. Notwithstanding the failure of any assignee to execute the assignment or provide the required security, the burdens of the CUP and the Development Agreement shall be binding upon such assignee, but their benefits shall not inure to such assignee until and unless such assignment is executed and such security is provided and the County has delivered a written release to Developer confirming the sufficiency of the replacement security.

- D. Notwithstanding any sale, transfer, or assignment, Developer shall continue to be obligated under this Agreement until the County executes a release of such security. The County's unreasonable failure to approve the assignment or execute such release may be a default under Section 19 of this Agreement.
- E. County shall be reimbursed by Developer for any costs of review of the replacement security interest(s).

#### **G-10 REPORTS/INFORMATION:**

If requested by the Imperial County Planning Director, Permittee at its sole expense shall provide any such documentation/report as necessary to ascertain compliance with the Conditional Use Permit. The format, content and supporting documentation shall be as required by the Imperial County Planning Director.

#### **G-11 DEFINITIONS:**

In the event of a dispute the meaning(s) or the intent of any word(s), phrase(s) and/or conditions or sections herein shall be determined by the Imperial County Planning Commission. Their determination shall be final unless an appeal is made to the Imperial County Board of Supervisors within the required time.

#### **G-12 MINOR AMENDMENTS:**

The Planning & Development Services Director may approve minor changes or modification(s) to the design, construction, and/or operation of the Project provided ~~said changes are necessary for~~ the Project to meet other laws,

regulations, codes, or conditions of the CUP, EIR and MMRP, and provided such changes will not result in any additional environmental impacts.

**G-13 SPECIFICITY:**

The issuance of this permit provides a temporary use right on the project property within the requirements set out here and does not authorize the Permittee to construct or operate the Project in violation of any LORS or beyond the duration, term or specified boundaries of the Project as shown the application/project description/permit, nor shall this permit allow any accessory or ancillary use not specified herein. This permit does not provide any prescriptive right or use to the Permittee for future addition and/or modifications to the Project.

**G-14 NON-COMPLIANCE (ENFORCEMENT & TERMINATION):**

Should the Permittee violate any condition herein, the County shall give written notice of such violation and actions required of Permittee to correct such violation. If Permittee does not act to correct the identified violation within forty-five (45) days after written notice, County may revoke the CUP. If Permittee pursues correction of such violation with reasonable diligence, the County may extend the cure period. Upon such revocation, County may, at its sole discretion, cease processing, defending any lawsuit or paying for costs associated with the Project. County may include in such notice of violation and subsequent process default and/or termination of the Development Agreement along with violation or revocation of the CUP, and the procedures set out here shall govern.

**G-15 GENERAL WELFARE:**

All construction and operations of the solar energy and energy storage facility shall be conducted with consistency with all laws, conditions, adopted County policies, plans, mitigation measures and the permit application so that the Project will be in harmony with the area and not conflict with the public health, safety, comfort, convenience, and general welfare of those residing in the area.

**G-16 PERMITS OF OTHER AGENCIES INCORPORATED:**

Permits granted by other governmental agencies in connection with the Project are incorporated herein by reference. The County reserves the right to apply conditions of those permits, as the County deems appropriate and subject to its having jurisdiction; provided, however, that enforcement of a permit granted by another governmental agency shall require written concurrence by the respective agency. Permittee shall provide to the County, upon request, copies and amendments of all such permits.

**G-17 HEALTH HAZARD:**

If the County Health Officer reasonably determines that a significant health or

safety hazard exists to the public, the County Health Officer may require appropriate measures and the Permittee shall implement such measures to mitigate the health hazard. If the hazard to the public is determined to be imminent, such measures may be imposed immediately and may include temporary suspension of permitted activities. The measures imposed by the County Health Officer shall not prohibit the Permittee from requesting a special Imperial County Planning Commission meeting, provided the Permittee bears all related costs.

#### **G-18 APPROVALS AND CONDITIONS SUBSEQUENT TO GRANTING PERMIT:**

Permittee's acceptance of this permit shall be deemed to constitute agreement with the terms and conditions contained herein. Where a requirement is imposed in this permit that Permittee conduct a monitoring program, and where the County has reserved the right to impose or modify conditions with which the Permittee must comply based on data obtained there from, or where the Permittee is required to obtain additional conditional use permits for County approval for subsequent activities, and disagreement arises, the Permittee, operator and/or agent, the Imperial County Planning and Development Services Director or other affected party, as determined by the Imperial County Planning and Development Services Director, may request a hearing before the Imperial County Planning Commission. Upon receipt of a request, the Imperial County Planning Commission shall conduct a hearing and make a written determination. The Imperial County Planning Commission may request support and advice from a technical advisory committee. Failure of the Imperial County Planning Commission to act shall constitute endorsement of staff's determination with respect to implementation.

(TOTAL "G" CONDITIONS are 18)

---

#### **SITE SPECIFIC CONDITIONS:**

##### **S-1 AUTHORIZED SCOPE OF ACTIVITIES:**

Consolidated Edison Development Inc. shall be the master developer for this Project and shall be responsible as for all improvements, septic, approved potable water system(s), pipelines, roads and other improvements discussed in the Conditional Use Permit Applications, FEIR, and MMRP. If Permittee sells all or part of this Project, an approved agreement shall be in place for new Project owner to build and maintain as agreed to by the conditions set forth in this CUP. The Imperial County Planning and Development Services Director shall approve of such agreement between Permittee and a new master Developer for this Project. The County Assessor's Office shall be notified of any ownership change.

CUP #19-0015. Consolidated Edison Development (CED) Westside Canal Battery Storage, LLC (Applicant) is proposing to develop, design, construct, own, operate, and decommission the Westside Canal Battery Storage Project, a utility-scale energy storage complex with the capacity of up to 2,000 Megawatts (MW) at full build out. The Project Site is located in the unincorporated Mount Signal area of Imperial County, approximately eight miles southwest of the City of El Centro and approximately five miles north of the U.S.-Mexico border. The Project Site encompasses approximately 163 acres of land, 148 of which are owned by the Applicant, and the remaining land is owned by the BLM, Imperial Irrigation District (IID), and a private landowner. The application for the Project proposes a General Plan Amendment to change the land use designation of the Project Site from Agriculture to Industry, and Zone Change to change the zoning from Heavy Agriculture (A-3) to Medium Industrial (M-2) zoning. A Conditional Use Permit would be required and specifically limited to energy production/use.

The Project would store energy generated from the electrical grid, and optimally discharge that energy back into the grid upon demand. The Project would be constructed in multiple phases over a 10-year period with each phase ranging from approximately 25 MW to 400 MW. For the purposes of the EIR analysis, Project construction was assumed to occur over three to five phases. Given the approximately 10-year development of the Project, the expected end date of the Project life cycle would be 30 years from the construction of the final phase, or no more than 40 years after the effective date of the Conditional Use Permit.

The Project would be comprised of Li-ion and/or flow battery energy storage system facilities, a behind-the-meter solar energy component, a new on-site 230-kilowatt (kW) loop-in switching station, a 34.5 kV to 230 kV Project substation, underground electrical cables, and permanent vehicular access to and from the Project Site over a proposed clear-span bridge spanning IID's Westside Main Canal.

The proposed loop-in switching station would connect the Project to the existing IID Campo Verde-Imperial Valley 230 kV radial gen-tie line, which connects to the Imperial Valley (IV) Substation and the California Independent System Operator (CAISO), approximately one-third mile south of the Project Site. The Applicant has submitted the necessary Interconnection Request Applications to the CAISO and IID.

**Site Access-** Permanent vehicular access to and from the Project Site would occur over a proposed clear-span bridge spanning IID's Westside Main Canal.

## **S-2 AESTHETICS:**

The Permittee shall design and maintain all buildings and equipment enclosures to have exterior surfaces with neutral, non-reflective colors. The construction and maintenance of County-approved landscaping along the access into the Operation/Maintenance Facility shall be in

compliance with the Land Use Ordinance, Division 3, Chapters 1 and 2, Sections 90302.00 through 90302.19.

1. The Permittee shall design and install lighting at construction storage yards and staging areas, such that light bulbs and reflectors are not visible from public viewing areas; lighting does not create reflected glare; and illumination of the Project facilities, vicinity, and nighttime sky is minimized.
2. Lighting shall be designed so exterior light fixtures are hooded, with lights directed downward or toward the area to be illuminated and so that backscatter to the nighttime sky is minimized. The design of the lighting shall be such that the luminescence or light source is shielded to minimize light trespass outside the Project boundary.
3. All lighting shall be of minimum necessary brightness consistent with worker safety and OSHA-Requirements.
4. High illumination areas not occupied on a continuous basis shall have switches or motion detectors to light the area only when occupied.

### **S-3 AGRICULTURE**

#### **AG-1: Payment of Agricultural and Other Benefit Fees**

One of the following options included below is to be implemented prior to the issuance of a grading permit or building permit for the Project:

#### **Mitigation for Non-Prime Farmland**

**Option 1:** Provide Agricultural Conservation Easement(s). The Permittee shall procure Agricultural Conservation Easements on a "1 on 1" basis on land of equal size, of equal quality farmland, outside the path of development. The conservation easement shall meet Department of Conservation regulations and shall be recorded prior to issuance of any grading or building permits; or

**Option 2:** Pay Agricultural In-Lieu Mitigation Fee. The Permittee shall pay an "Agricultural In-Lieu Mitigation Fee" in the amount of 20 percent of the fair market value per acre for the total acres of the proposed site based on five comparable sales of land used for agricultural purposes as of the effective date of the permit, including program costs on a cost recovery/time and material basis. The Agricultural In-Lieu Mitigation Fee, will be placed in a trust account administered by the Imperial County Agricultural Commissioner's office and will be used for such purposes as the acquisition, stewardship, preservation, and enhancement of agricultural lands within Imperial County; or,

**Option 3: Public Benefit Agreement.** The Permittee and County shall voluntarily enter into an enforceable Public Benefit Agreement or Development Agreement that includes an Agricultural Benefit Fee payment that is 1) consistent with Board Resolution 2012-005; 2) the Agricultural Benefit Fee must be held by the County in a restricted account to be used by the County only for such purposes as the stewardship, preservation and enhancement of agricultural lands within Imperial County and to implement the goals and objectives of the Agricultural Benefit program, as specified in the Development Agreement, including addressing the mitigation of agricultural job loss on the local economy.

#### **S-4 AIR QUALITY:**

1. The Permittee shall comply at all times with the Imperial County Air Pollution Control District's (ICAPCD) Regulation VIII, Fugitive Dust Control. The primary pollutant controlled by this regulation is PM<sub>10</sub>, "fugitive dust." All identified PM<sub>10</sub> sources associated with the construction and operation of the facility, such as open areas, roads, stock piles, material transport and grading activities, shall be controlled such that surface areas are stabilized and visible dust emissions are below 20%. Any control measure not listed within the appropriate sections of Regulation VIII, such as but not limited to watering, graveling, chemical stabilizers and wind barriers shall not be utilized without prior approval from the ICAPCD.
2. In order to assure that NO<sub>x</sub> emissions released during construction remain below the significance threshold, the Air District requests that prior to the start of construction, the applicant will be required to submit a Construction Equipment List (in Excel format) to APCD detailing the equipment type, make, model, year, horsepower, actual hours of daily operation, date equipment arrived on site, and date removed from site, for the purpose of performing NO<sub>x</sub> evaluations. If the emissions are found to exceed CEQA thresholds of significance, the project would then be subject to Policy 5, which provides two options: proposing an off-site mitigation project and supporting documentation that the reductions are met, or; pay an in-lieu mitigation fee.<sup>1</sup>
  - Prior to commencing construction, each CUP owner shall submit to the ICAPCD for approval a Dust Control Plan identifying all sources of PM<sub>10</sub> emissions and associated mitigation measures during the construction and operational phases of the project. Permittee shall submit a "Construction Notification Form" to the ICAPCD ten (10) days prior to the commencement of any earthmoving activity as needed by Regulation VIII rules. The Dust Control Plan

submitted to ICAPCD shall meet all applicable requirements for control of fugitive dust emissions, including the following measures designed to achieve the no greater than 20% opacity performance standard for dust control. In addition, the applicant shall submit an Operational Dust Control Plan and obtain Air District approval prior to issuance of a Certification of Occupancy.<sup>2</sup>

3. The Permittee shall comply with all applicable standard mitigation measures for construction combustion equipment for the reduction of excess NOx emissions as identified in the air quality analysis and as contained in the Imperial County CEQA Air Quality Handbook and associated regulations.
    - Utilize all Tier 3 or Tier 4 construction equipment.
    - Prohibit idling of equipment not in use; for equipment in use reduce idling time to a maximum of 5 minutes.
    - Where feasible replace fossil fuel burning equipment with electrically driven equivalents provided they are not powered via a portable generator
    - Register all portable engines 50 horse power or greater with the ICAPCD.
  1. The Project Applicant shall prepare a Dust Control Plan for control of fugitive dust during construction as required by ICAPCD Regulation VIII. The Dust Control Plan shall also include dust control measures to be implemented during the operation and maintenance phase of the Project. The Dust Control Plan shall address construction and earthmoving activities, track-out, open areas and unpaved roads.
  2. The Dust Control Plan shall also include information on the dust suppressants to be applied and the specific surface treatment(s) and/or control measures to be utilized to control track-out where unpaved and/or access points join paved public access roads. The Dust Control Plan shall be submitted for ICAPCD review prior to any earthmoving activities.
  3. Timing/Implementation: Submittal of Dust Control Plan to ICAPCD for review prior to any earthmoving activities; Implementation of Dust Control Plan during construction and operation/maintenance phases as specified in the Dust Control Plan.
  4. Enforcement/Monitoring: ICPDSD and ICAPCD. As noted in the Methodology discussion, all construction activity CalEEMod modeling was done incorporating on-site watering three times daily during the grading activities. Accordingly, the following mitigation measures shall be employed:
-

**AIR-1** All construction sites, regardless of size, must comply with the requirements contained within Regulation VIII. *Standard Mitigation Measures for Fugitive Dust (PM10) Control*

- a) All disturbed areas, including Bulk Material storage which is not being actively utilized, shall be effectively stabilized and visible emissions shall be limited to no greater than 20 percent opacity for dust emissions by using water, chemical stabilizers, dust suppressants, tarps, or other suitable material such as vegetative ground cover.
- b) All on-site and off-site unpaved roads would be effectively stabilized, and visible emissions shall be limited to no greater than 20 percent opacity for dust emissions by paving, chemical stabilizers, dust suppressants and/or watering.
- c) All unpaved traffic areas 1 acre or more with 75 or more average vehicle trips per day would be effectively stabilized and visible emission shall be limited to no greater than 20 percent opacity for dust emissions by paving, chemical stabilizers, dust suppressants and/or watering.
- d) The transport of Bulk Materials shall be completely covered unless 6 inches of freeboard space from the top of the container is maintained with no spillage and loss of Bulk Material. In addition, the cargo compartment of all Haul Trucks is to be cleaned and/or washed at delivery site after removal of Bulk Material.
- e) All Track-Out or Carry-Out would be cleaned at the end of each workday or immediately when mud or dirt extends a cumulative distance of 50 linear feet or more onto a paved road within an urban area.
- f) Movement of Bulk Material handling or transfer shall be stabilized prior to handling or at points of transfer with application of sufficient amounts of water, chemical stabilizers or by sheltering or enclosing the operation and transfer line.
- g) The construction of any new unpaved road is prohibited within any area with a population of 500 or more unless the road meets the definition of a temporary unpaved road. Any temporary unpaved road shall be effectively stabilized, and visible emissions shall be limited to no greater than 20 opacity for dust emission by paving, chemical stabilizers, dust suppressants and/or watering

**AIR-2: Construction Equipment Control Measures**

*Standard Mitigation Measures for Equipment Exhaust Emissions Control*

- a) Use of equipment with alternative fueled or catalyst-equipped diesel engine, including for all off-road and portable diesel-powered equipment.
- b) Minimize idling time either by shutting equipment off when not in use or limit the idling time to a maximum of 5 minutes.
- c) Limit, to the extent feasible, the hours of operation of heavy-duty equipment and/or the number of equipment in use.
- d) Replace fossil fueled equipment with electrically driven equivalents (provided they are not run via a portable generator set).

Required Mitigation Measures for Construction Equipment Mobilization

- The 1.2-mile portion of the access road from the IV Substation to the project site shall be covered with construction mats.
- No more than eight pieces of construction equipment shall be delivered to the project site in one day.
- A speed limit of 15 mph on the access road shall be enforced.

Required Mitigation Measures for Construction Activities

- The 1.2-mile portion of the southern access road from the IV Substation to the project site shall be covered with construction mats.
- A material delivery speed limit of 15 mph on the access road shall be enforced.
- For material deliveries from the south, one of the following dust suppressant measures would be required for the 4.4-mile service road:
  - A water truck shall apply water every 3 hours, or as deliveries occur; or
  - A chemical dust suppressant shall be applied.
- For the 0.3-mile portion of the northern access route that is unpaved (south of Wixom Road to the worker parking area) one of the following dust suppressant measures would be required:
  - A water truck shall apply water every 3 hours, or as worker access occurs;
  - A chemical dust suppressant shall be applied.
  - Water truck shall apply water to all active onsite grading areas every 3 hours.

*Enhanced Mitigation Measures for Construction Equipment* To help provide a greater degree of reduction of PM emissions from construction combustion equipment, ICAPCD recommends the following measures:

- a. Curtail construction during periods of high ambient pollutant concentrations; this may include ceasing of construction activity during the peak hour of vehicular traffic on adjacent roadways.
- b. Implement activity management (e.g., rescheduling activities to reduce short-term impacts).

**AIR-3: Operational Dust Control Plan**

- a) To help reduce fugitive dust emission from on-site unpaved roads and accumulation of small dunes during operations, an Operational Dust Control Plan (ODCP) would be prepared. The ODCP would include strategies for how dust emissions would be controlled and maintained during Project operations. The ODCP would be submitted to the ICAPCD for approval prior to the issuance of a Certificate of Occupancy.

**S-5 BIOLOGICAL**

**BR-1 Compensation for Permanent and Temporary Impacts to Vegetative**

## **Communities**

- To compensate for permanent and temporary impacts to on-site vegetative communities, within the Project Site, habitat (which may include preservation areas within portions of the Project Site not impacted by construction or mitigation lands outside of the main Project Site) that contains the same quality of vegetative communities impacted by the Project and that is not already public land shall be preserved and managed in perpetuity at the following ratios – temporary impacts to native vegetation communities shall be mitigated at a 1:1 mitigation ratio (one acre preserved/restored for each acre impacted) and permanent impacts shall be mitigated at a ratio of 2:1. Impacts to CDFW listed sensitive or riparian communities shall be mitigated at a ratio of 3:1. Land acquired/dedicated for impacts to native vegetation communities must be with lands occupied by habitat of a similar type and quality.
- Prior to the disturbance of vegetation, the Applicant shall obtain County approval of preserved and/or mitigation lands as well as documentation of a recorded conservation easement. The compensation for the loss of habitats may be achieved either by a) on-site habitat creation or enhancement habitats with similar species composition to those present prior to construction, b) offsite creation or enhancement of, or c) participation in an established mitigation bank program.
- Prior to the removal of native vegetation, if on- or off-site mitigation is required, a Habitat Restoration Plan (HRP) shall be prepared that will guide all restoration and monitoring activities (refer to MM BR-2 for details on the plan requirements).

### **BR-2: Develop a Habitat Restoration Plan**

- The Applicant shall restore temporarily disturbed areas to pre-construction conditions or better prior to the issuance of a grading permit and removal of any vegetation and/or wetland habitat. To this end, the Applicant shall retain a County qualified biologist, knowledgeable in the area(s) of annual grassland and wetland habitat restoration, to prepare a Habitat Restoration Plan (HRP).
- The Applicant shall submit the HRP to the County for approval (in consultation with CDFW and USFWS). The biologist will also be responsible for monitoring the implementation of the plan as well as the progress on achieving the established success criteria.
- The HRP shall expressly identify the process by which all disturbed areas shall be restored to pre-construction conditions or better.
- The plan will address restoration and revegetation related to disturbance from construction. It will also address restoration and revegetation required after decommissioning of the Project should this be required. The decommissioning plan shall include, at a minimum, the following items:
- Figures depicting areas proposed for temporary disturbance/mitigation lands – The HRP shall include detailed figures indicating the locations and vegetation types of areas proposed for temporary disturbance. These

figures shall be updated, as necessary, to reflect current Site conditions should they change.

- Proposed species for restoration/revegetation – The species palette proposed for restoration/revegetation shall include a combination of native annual and perennial species known to currently occur on the Project site and in adjacent habitats.
- Seed source and collection guidelines – Seeds shall first be collected from the stock of native plants occurring on the proposed Project site, during the appropriate collection period (late spring through the summer, depending on the species) and prior to disturbance from construction activities. Additional seed may be collected from stock within a 25-mile radius will be collected to maintain local genetic integrity. If seed collection from these areas is not possible then a seed source must be obtained from a local seed supplier familiar with native species. Seed will be limited to the species and quantity specified in the seed mix palette prepared for the Project. All seed will originate from the Project region, within +/- 1000 feet elevation of the Project site. The seed supplier chosen will provide a list of three references with the bid proposal. The references will include year, contact names, and telephone numbers. Seeds will be tested for percent purity, percent germination, number of pure live seeds per pound, and weed seed content. Seed testing will be the responsibility of the seed supplier.
- Planting methodology – A description of the preferred methods proposed for container plant installation or seeding shall be provided (e.g., hydro-seeding, drill seeding, broadcast seeding, etc.). Additionally, a discussion on timing of seeding, type of irrigation system proposed, potential need of irrigation, type and duration of irrigation, and erosion controls proposed for revegetation activities shall be included.
- Invasive, non-native vegetation Control – A comprehensive discussion on weed control for the Project site will be developed and included in the HRP. This will serve to prevent the type conversion of natural habitats to those dominated by invasive species known to occur in the area.
- Monitoring program – Areas subject to restoration/revegetation shall be monitored to assess conditions and to make recommendations for successful habitat establishment. Monitoring will be performed by a County qualified biologist(s), knowledgeable in the area of annual grassland habitat restoration. Monitoring should include, at a minimum, the following:
  - Qualitative Monitoring – Qualitative monitoring surveys will be performed monthly in all restored/revegetated areas for the first year following planting in any phase of the Project.
  - Qualitative monitoring will be on a quarterly schedule thereafter, until final completion approval of each restoration/revegetation area.
  - Qualitative surveys will assess native plant species performance, including growth and survival, germination success, reproduction, plant fitness and health as well as pest or invasive plant problems.

A County qualified wildlife biologist will assist in monitoring surveys and will actively search for mammal and other wildlife use.

- Monitoring at this stage will indicate need for remediation or maintenance work well in advance of final success/failure determination. The monitoring reports will describe site progress and conditions and list all observations pertinent to eventual success, and make recommendations as appropriate regarding remedial work, maintenance, etc.
- Quantitative Monitoring – Quantitative monitoring will occur annually for years one to five or until the success, criteria are met. Within each revegetation area, as shown figures referenced above, the biologist will collect data in a series of 1 or 2 quadrats to estimate cover and density of each plant species within the revegetated areas. Data will be used to measure native species growth performance, to estimate native and nonnative species coverage, seed mix germination, native species recruitment and reproduction, and species diversity.
- Additionally, within wetland habitat restoration areas, the biologist shall conduct sampling events to document the presence of hydric soil characteristics/indicators (if present).
- Based on these results, the biologist will make recommendations for maintenance or remedial work on the site and for adjustments to the approved seed mix.
- Success criteria – Criteria for successful restoration/revegetation of disturbed areas shall be provided.
- Reporting – Reporting will include progress reports summarizing site status and recommended remedial measures that will be submitted by the biologist to the County quarterly, with the exception of the site visits immediately preceding the development of each annual status report (see below). Each progress report will list estimated species coverage and diversity, species health and overall vigor, the establishment of volunteer native species, topographical/soils conditions, problem weed species, the use of the site by wildlife species, significant drought stress, and any recommended remedial measures deemed necessary to ensure compliance with specified performance criteria.
- One annual site status report that summarizes site conditions will be forwarded by the biologist to the County, the USFWS and the CDFW at the end of each year following implementation of this plan until the established success criteria have been met. Each annual report will list species coverage and diversity measured during yearly quantitative surveys, compliance/non-compliance with required performance standards, species health and overall vigor, the establishment of volunteer native species, hydrological and topographical conditions, the use of the site by wildlife species, and the presence of invasive weed species. In the event of substantial noncompliance with the required performance criteria, the reports will include remedial measures deemed necessary to ensure future compliance with

specified perform a criteria. Each annual report will include, at the minimum:

- The name, title, and company of all persons involved in restoration monitoring and report Preparation.
- Maps or aerials showing restoration areas, transect locations, and photo documentation locations.
- An explanation of the methods used to perform the work, including the number of acres treated for removal of non-native plants
- An assessment of the treatment success.
- 

**BR-3: Implement a Worker Environmental Education Program**

- Prior to any Project activities on the Site (i.e., surveying, mobilization, fencing, grading, or construction), a Worker Environmental Education Program (WEEP) shall be prepared and implemented by a qualified biologist(s). The WEEP shall be submitted to the County for review and approval prior to issuance of construction permits and implemented throughout the duration of the construction activities.
- The WEEP shall be put into action prior to the beginning of any Site related activities, including but not limited to those activities listed above, and implemented throughout the duration of Project construction. The WEEP, shall include, at a minimum, the following items:
  - Training materials and briefings shall include, but not be limited to a discussion of the Federal and State Endangered Species Acts, BGEPA, and the MBTA; the consequences of non-compliance with these acts; identification and values of plant and wildlife species and significant natural plant community habitats; hazardous substance spill prevention and containment measures; a contact person and phone number in the event of the discovery of dead or injured wildlife; and a review of mitigation requirements.
  - A discussion of measures to be implemented for avoidance of the sensitive resources discussed above and the identification of an on-site contact in the event of the discovery of sensitive species on the Site.
  - Protocols to be followed when roadkill is encountered in the work area or along access roads to minimize potential for additional mortality of scavengers, including listed species such as the California condor and the identification of an on-site representative to whom the roadkill will be reported. Roadkill shall be reported to the appropriate local animal control agency within 24 hours.
  - Maps showing the known locations of special status wildlife, populations of rare plants and sensitive vegetative communities, seasonal depressions and known waterbodies, wetland habitat, exclusion areas, and other construction limitations (e.g., limited operating periods, etc.). These features shall be included on the Project's plans and specifications drawings.

- Literature and photographs or illustrations of potentially occurring special status plant and/or wildlife species will be provided to all Project contractors and heavy equipment operators.
- The Applicant shall provide to the County evidence that all on-site construction and security personnel have completed the WEEP prior to the start of Site mobilization. A special hardhat sticker or wallet size card shall be issued to all personnel completing the training, which shall be carried with the trained personnel at all times while on the Project Site. All new personnel shall receive this training and may work in the field for no more than five days without participating in the WEEP. A log of all personnel who have completed the WEEP training shall be kept on Site.
- A weather protected bulletin board or binder shall be centrally placed or kept on-site (e.g., in the break room, construction foreman's vehicle, construction trailer, etc.) for the duration of the construction. This board or binder will provide key provisions of regulations or Project conditions as they relate to biological resources or as they apply to grading activities. This information shall be easily accessible for personnel in all active work areas.
- Develop a standalone version of the WEEP, that covers all previously discussed items above, and that can be used as a reference for maintenance personnel during Project operations.

#### **BR-4: Implementation of Best Management Practices**

- BMPs will be implemented as standard operating procedures during all ground disturbance, construction, and operation related activities to avoid or minimize project impacts on biological resources. These BMPs will include but are not limited to the following:
  - (a) Compliance with BMPs will be documented and provided to the County in a written report on an annual basis. The report shall include a summary of the construction activities completed, a review of the sensitive plants and wildlife encountered, a list of compliance actions and any remedial actions taken to correct the actions, and the status of ongoing mitigation efforts.
  - (b) Prior to ground disturbance of any kind the Project work areas shall be clearly delineated by stakes, flags, or other clearly identifiable system.
  - (c) Vehicles and equipment shall be parked on pavement, existing roads, and previously disturbed areas to the extent practicable.
  - (d) Speed limit signs, imposing a speed limit of 15 miles per hour, will be installed throughout the Project Site prior to initiation of Site disturbance and/or construction. To minimize disturbance of areas outside of the construction zone, all Project-related vehicle traffic shall be restricted to established roads, construction areas, and other designated areas. These areas will be included in preconstruction surveys and to the extent possible, should be established in locations

disturbed by previous activities to prevent further impacts. Off-road traffic outside of designated Project areas will be prohibited.

- (e) No vehicles or equipment shall be refueled within 100 feet of an ephemeral drainage or wetland unless a berm and lined refueling area is constructed. Spill kits shall be maintained on-site in sufficient quantity to accommodate at least three complete vehicle tank failures of 50 gallons each. Any vehicles driven and/or operated within or adjacent to drainages or wetlands shall be checked and maintained daily to prevent leaks of materials.
- (f) All general trash, food-related trash items (e.g., wrappers, cans, bottles, food scraps, cigarettes, etc.) and other human-generated debris will be stored in animal proof containers and/or removed from the Site each day. No deliberate feeding of wildlife will be allowed.
- (g) All pipes and culverts with a diameter of greater than 4 inches shall be capped or taped closed. Prior to capping or taping the pipe/culvert shall be inspected for the presence of wildlife. If encountered the wildlife shall be allowed to escape unimpeded.
- (h) No firearms will be allowed on the Project Site, unless otherwise approved for security personnel.
- (i) To prevent harassment or mortality of listed, special-status species and common wildlife, or destruction of their habitats no domesticated animals of any kind shall be permitted in any Project area.
- (j) Use of chemicals, fuels, lubricants, or biocides will comply with all local, state, and federal regulations. All uses of such compounds shall observe label and other restrictions mandated by the U.S. EPA, California Department of Food and Agriculture, and other state and federal legislation, as well as additional Project-related restrictions deemed necessary by the USFWS and CDFW. Use of rodenticides is restricted.
- (k) Any contractor or employee that inadvertently kills or injures a special status animal, or finds one either dead, injured, or entrapped, will immediately report the incident to the on-site representative identified in the WEEP. The representative will contact the USFWS, CDFW, and County by telephone by the end of the day, or at the beginning of the next working day if the agency office is closed. In addition, formal notification shall be provided in writing within three working days of the incident or finding. Notification will include the date, time, location, and circumstances of the incident. Any threatened or endangered species found dead or injured will be turned over immediately to CDFW for care, analysis, or disposition.
- (l) During the Site disturbance and/or construction phase, grading and construction activities before dawn and after dusk, is prohibited.
- (m) Avoidance and minimization of vegetation removal within active construction areas, including the flagging of sensitive vegetative communities or plants.
- (n) Avoidance and minimization of construction activities resulting in impacts to wetlands, streambeds, and banks of any ephemeral drainage unless permitted to do so.

- (o) All excavation, steep-walled holes, or trenches in excess of 6 inches in depth will be covered at the close of each working day by plywood or similar materials or provided with one or more escape ramps constructed of earth dirt fill or wooden planks. Trenches will also be inspected for entrapped wildlife each morning prior to onset of construction activities and immediately prior to covering with plywood at the end of each working day. Before such holes or trenches are filled, they will be thoroughly inspected for entrapped wildlife. Any wildlife discovered will be allowed to escape before construction activities are allowed to resume or removed from the trench or hole by a qualified biologist holding the appropriate permits (if required).
- (p) New light sources will be minimized, and lighting will be designed (e.g., using down- cast lights) to limit the lighted area to the minimum necessary.

#### **BR-5: Wildlife Pre-Construction Surveys and Biological Monitoring**

- Prior to ground disturbance or vegetation clearing within the Project Site, a qualified biologist shall conduct surveys for wildlife (no more than 72 hours prior to Site disturbing activities) where suitable habitat is present and directly impacted by construction activities. Wildlife found within the Project Site or in areas potentially affected by the Project will be relocated to the nearest suitable habitat that will not be affected by the Project prior to the start of construction. Special-status species found within a Project impact area shall be relocated by an authorized biologist to suitable habitat outside the impact area.

#### **BR-6: Implement Biological Construction Monitoring**

- Prior to the commencement of ground disturbance or Site mobilization activities, the Applicant shall retain a qualified biologist(s), for the duration of Project construction, with demonstrated expertise with listed and/or special-status plants, terrestrial mammals, and reptiles to monitor(s), on a daily basis, all construction activities. The qualified biologist(s) shall be present at all times during ground disturbing activities immediately adjacent to, or within, habitat that supports populations of the listed or special status species identified within the Project boundaries. Any listed or special-status plants shall be flagged for avoidance. Any special-status terrestrial species found within a Project impact area shall be relocated by the by the authorized biologist and relocated to suitable habitat outside the impact area. If the installation of exclusion fencing is deemed necessary by the authorized biologist, the authorized biologist shall direct the installation of the fence. Clearance surveys for special-status species shall be conducted by the authorized biologist prior to the initiation of construction each day.
- If the biological monitor observes a dead or injured listed or special-status wildlife species on the construction Site during construction, a written report shall be sent to the County, CDFW and/or USFWS within five

calendar days. The report will include the date, time of the finding or incident (if known), and location of the carcass and circumstances of its death (if known). The biological monitor shall, immediately upon finding the remains, coordinate with the on-site construction supervisor, to discuss the events that caused the mortality (if known) and implement measures to prevent future incidents. Details of these measures shall be included with the report. Species remains shall be collected and frozen as soon as possible, and CDFW and/or USFWS shall be contacted regarding ultimate disposal of the remains.

**BR-7: Conduct Pre-Construction Surveys for Nesting and Breeding Birds and Implementation of Avoidance Measures**

- Prior to any Site disturbance (i.e., mobilization, staging, grading or construction), the Applicant shall retain a qualified biologist(s) to conduct pre-construction surveys for nesting birds within the recognized breeding season (generally February 15 – September 15 but may start earlier for some raptor species) in all areas within 500 feet of Project components (staging areas, substation sites, battery facility structures including, solar arrays, and access road locations). The initial survey event must be completed no more than three days prior to vegetation removal or ground disturbing activities. The required survey dates may be modified based on local conditions, as determined by the qualified biologist(s), with the approval of the County, in consultation with the USFWS and/or CDFW. Measures intended to exclude nesting birds shall not be implemented without prior approval by the County in consultation with USFWS and/or CDFW and shall not exceed County noise standards.
- If breeding birds with active nests are found prior to or during construction, a biological monitor shall establish a 300-foot buffer around the nest for ground-based construction activities and no activities will be allowed within the buffer(s) until the young have fledged from the nest or the nest fails.
- The prescribed buffers may be adjusted to reflect existing conditions including ambient noise, topography, and disturbance with the approval of the County, CDFW and USFWS as appropriate. The biological monitor(s) shall conduct regular monitoring of the nest to determine success/failure and to help ensure that Project activities are not conducted within the buffer(s) until the nesting cycle is complete or the nest fails. The biological monitor(s) shall be responsible for documenting the results of the surveys and ongoing monitoring and will provide a copy of the monitoring reports for impact areas to the respective agencies.
- If for any reason a bird nest must be removed during the nesting season, the Applicant shall provide written documentation providing concurrence from the USFWS and CDFW authorizing the nest relocation. Additionally, the Applicant shall provide a written report documenting the relocation efforts. The report shall include what actions were taken to avoid moving the nest, the location of the nest, what species is being relocated, the number and condition of the eggs taken from the nest, the location of

where the eggs are incubated, the survival rate, the location of the nests where the chicks are relocated, and whether the birds were accepted by the adopted parent.

- Surveys shall be conducted to include all structural components, related structures, as well as all construction equipment. If birds are found to be nesting in facility structures, buffers as described above shall be implemented. If birds are found to be nesting in construction equipment, that equipment shall not be used until the young have fledged the nest or, if no young are present, until after the breeding season has passed.
- If trees are to be removed as part of Project-related construction activities, they will be done so outside of the nesting season to avoid additional impacts to nesting raptors. If removal during the nesting season cannot be avoided, the biological monitor must confirm that the nest is vacant prior to its removal. If nests are found within these structures and contain eggs or young, the biological monitor shall allow no activities within a 300-foot buffer for nesting birds and/or a 500-foot buffer for raptors until the young have fledged the nest.

#### **BR-8: Implement Avian Power Line Interaction Committee guidelines**

- The Applicant will be required to construct all transmission facilities, towers, poles, and lines in accordance with and comply with all policies set forth in the Suggested Practices for Raptor Protection on Power Lines: The State of the Art in 2006 and Reducing Avian Collisions with Power Lines: The State of the Art in 2012 (APLIC), to minimize avian electrocutions as a result of the construction of the Project. Details of design components shall be indicated on all construction plans and measures to comply with Avian Power Line Interaction Committee (APLIC) policies and guidelines shall be detailed in a separate attachment, all of which will be submitted with the construction permit application. The Applicant shall be required to monitor for new versions of the APLIC guidelines and update designs or implement new measures as needed during Project construction, provided these actions do not require the purchase of previously ordered transmission line structures. A review of compliance with submitted materials will be conducted prior to the final County inspection.

#### **BR-9: Conduct Pre-Construction Surveys for State and Federally Threatened, Endangered, Proposed, Petitioned, and Candidate Plants and Implementation of Avoidance Measures**

- Prior to initial ground disturbance and for undisturbed areas in subsequent construction years, the Applicant shall conduct pre- construction surveys for State and federally listed Threatened and Endangered, Proposed, Petitioned, and Candidate plants in all areas subject to ground-disturbing activity, including, but not limited to, battery facility structures including, access roads, poles/towers, solar array footing preparation, construction areas, and assembly yards. The surveys shall be conducted during the

appropriate blooming period(s) by a qualified plant ecologist/biologist according to protocols established by the USFWS, CDFW, and CNPS. All listed plant species found shall be marked and avoided. Any populations of special-status plants found during surveys will be fully described, mapped, and a CNPS Field Survey Form or written equivalent shall be prepared.

- These surveys must be accomplished during a year in which rainfall totals are at least 80 percent of average and in which the temporal distribution of rainfall is not highly abnormal (e.g., with most rainfall occurring very early or late in the season) to be reasonably certain of the presence/absence of rare plant species, unless surveys of reference populations document that precipitation conditions would not have adversely affected the ability to detect the species. This condition may be waived with the approval of the County after consultation with the CDFW and USFWS. If a listed plant species cannot be avoided, consultation with USFWS and CDFW will occur.
- Prior to Site grading or vegetation removal, any populations of listed plant species identified during the surveys within the Project limits and beyond, shall be protected and a buffer zone placed around each population. The buffer zone shall be established around these areas and shall be of sufficient size to eliminate potential disturbance to the plants from human activity and any other potential sources of disturbance including human trampling, erosion, and dust. The size of the buffer depends upon the proposed use of the immediately adjacent lands and includes consideration of the plant's ecological requirements (e.g., sunlight, moisture, shade tolerance, physical and chemical characteristics of soils) that are identified by a qualified plant ecologist and/or botanist. The buffer for herbaceous and shrub species shall be, at minimum, 50 feet from the perimeter of the population or the individual. A smaller buffer may be established, provided there are adequate measures in place to avoid the take of the species, with the approval of the USFWS, CDFW, and County.
- Where impacts to listed plants are determined to be unavoidable, the USFWS and/or CDFW shall be consulted for authorization. Should any CESA-listed plant species be detected, an incidental take permit would need to be obtained. Additional mitigation measures to protect or restore listed plant species or their habitat, including but not limited to a salvage plan including seed collection and replanting, may be required by the USFWS or CDFW before impacts are authorized, whichever is appropriate.

**BR-10: Compensate for Impacts to State and Federally Threatened, Endangered, Proposed, Petitioned, and Candidate Plants**

- To compensate for permanent impacts to State and Federally Threatened, Endangered, Proposed, Petitioned and Candidate plants, habitat (which may include preservation areas within the undisturbed areas of the Project footprint, mitigation lands outside of the main Project Site or a combination of both) that is not already public land shall be

preserved and managed in perpetuity at a 1:1 mitigation ratio (one acre preserved for each acre impacted). Prior to the disturbance of habitat for or take of listed plant species the Applicant will be required to obtain County approval of preserved and/or mitigation lands as well as provide documentation of a recorded conservation easement(s). Compensation for temporary impacts shall include land acquisition and/or preservation at a 0.5:1 ratio. The preserved habitat for a significantly impacted plant species shall be of equal or greater habitat quality to the impacted areas in terms of soil features, extent of disturbance, vegetation structure, and will contain verified extant populations, of the same size or greater, of the State or Federally listed plants that are impacted.

- Habitat shall be preserved through the use of permanent open space easements. Mitigation lands cannot be located on land that is currently held publicly. Mitigation lands may include (depending on the habitat requirements of particular species):
  - Areas outside the Project boundary, but within the general Project region
  - Preservation areas within portions of the Project Site that are at least 100 feet from Project components and are either (1) not permanently impacted by construction and operation of the Project, or (2) temporarily disturbed and then restored according to the requirements in Mitigation Measure BR-2; and
  - Degraded areas (e.g., areas that have been actively dry-farmed) that are restored to high quality habitat through the implementation of a County approved restoration plan.
- Criteria for appropriate mitigation land are species specific; the following factors must be considered in assessing the quality of potential mitigation habitat: (1) Current land use; (2) Location (e.g., habitat corridor, part of a large block of existing habitat, adjacency to source populations, proximity to Project facilities or other potential sources of disturbance); (3) Vegetation composition and structure;
- Slope; (5) Soil composition and drainage; and (6) Level of occupancy or use by relevant species.
- The Applicant shall either provide open space easements or provide funds for the acquisition of such easements to a "qualified easement holder" (defined below). The CDFW is a qualified easement holder. To qualify as a "qualified easement holder" a private land trust must have the following:
  - Substantial experience managing open space easements that are created to meet mitigation requirements for impacts to sensitive species
  - Adopted the Land Trust Alliance's Standards and Practices
  - A stewardship endowment fund to pay for its perpetual stewardship obligations
  - The County shall determine whether a proposed easement holder meets these requirements.
  - The Applicant shall also be responsible for donating to the conservation easement holder fees sufficient to cover:
    - (1) Administrative costs incurred in the creation of the conservation easement (appraisal, documenting baseline conditions, etc.) and

Funds in the form of a non-wasting endowment to cover the cost of monitoring and enforcing the terms of the conservation easement in perpetuity. The amount of these administrative and stewardship fees shall be determined by the conservation easement holder in consultation with the County. Open space easement(s) shall also be subject to the following conditions:

- The locations of acceptable easement(s) shall be developed with approval of CDFW and USFWS.
- The primary purpose of the easement(s) shall be conservation of impacted species and habitats, but the conservation easement(s) shall also allow livestock grazing when and where it is deemed beneficial for the habitat needs of impacted species. Open space easement(s) shall:
  - Be held in perpetuity by a qualified easement holder (defined above).
  - Be subject to a legally binding agreement that shall:
    - (1) Be recorded with the County Recorder(s); and
    - (2) Name CDFW or another organization to which the easement(s) will be conveyed if the original holder is dissolved.
  - Be subject to the management requirements outlined in Mitigation. However, if lands acquired or protected for the compensation of permanent impacts to wildlife and/or vegetative communities (discussed above) contain similar sized populations of the impacted listed plant species, no further mitigation would be required.

#### **BR-11: Conduct Pre-Construction Surveys for Special-Status Plants and Implement Avoidance Measures**

- Prior to initial ground disturbance and for undisturbed areas in subsequent construction years, the Applicant shall conduct pre-construction surveys for special-status plant species in all areas subject to ground-disturbing activity, including, but not limited to, battery facility structures including, access roads, poles/towers, construction areas, and assembly yards. The surveys shall be conducted during the appropriate blooming period(s) by a qualified plant ecologist/biologist according to protocols established by the USFWS, CDFW, and CNPS. All listed plant species found shall be marked and avoided. Any populations of special-status plants found during surveys will be fully described, mapped, and a CNPS Field Survey Form or written equivalent shall be prepared. These surveys must be accomplished during a year in which rainfall totals are at least 80 percent of average and in which the temporal distribution of rainfall is not highly abnormal (e.g., with most of the rainfall occurring very early or late in the season) to be reasonably certain of the presence/absence of rare plant species, unless surveys of reference populations document that precipitation conditions would not have adversely affected the detectability of the species.

- Prior to Site grading, any populations of special-status plant species identified during the surveys shall be protected by a buffer zone. The buffer zone shall be established around these areas and shall be of sufficient size to eliminate potential disturbance to the plants from human activity and any other potential sources of disturbance including human trampling, erosion, and dust. The size of the buffer depends upon the proposed use of the immediately adjacent lands and includes consideration of the plant's ecological requirements (e.g., sunlight, moisture, shade tolerance, physical and chemical characteristics of soils) that are identified by a qualified plant ecologist and/or botanist. The buffer for herbaceous and shrub species shall be, at minimum, 50 feet from the perimeter of the population or the individual. A smaller buffer may be established, provided there are adequate measures in place to avoid the take of the species, with the approval of the USFWS, CDFW, and County. Highly visible flagging shall be placed along the buffer area and remain in good working order during the duration of any construction activities in the area. If Project related impacts result in the loss of more than 10 percent of the on-site population of any Special-Status plant species, compensatory mitigation will be required as described below.

#### **BR-12: Compensate for Impacts to Special-Status Plant Species**

- If Project related impacts result in the loss of more than 10 percent of the on-site population of any Special-Status plant species, compensatory mitigation will be required. Prior to the disturbance of habitat for or take of Special Status plants/populations the Applicant must receive County approval of preserved and/or mitigation lands as well as present documentation of a recorded conservation easement(s). Compensation will be required for all impacts that exceed the 10 percent threshold (e.g., impacts to 15 percent of a population will only require compensation for 5 percent or the amount of impacts that exceed the 10 percent threshold). To compensate for permanent impacts to special-status plant species, habitat (which may include preservation of areas within the undisturbed areas of the Project footprint, mitigation lands outside of the main Project Site or a combination of both) that is not already public land shall be preserved and managed in perpetuity at a 1:1 mitigation ratio (one acre preserved for each acre impacted). Compensation for temporary impacts shall include land acquisition and/or preservation at a 0.5:1 ratio. The preserved habitat for a significantly impacted plant species shall be of equal or greater habitat quality to the impacted areas in terms of soil features, extent of disturbance, vegetation structure, and will contain verified extant populations, of the same size or greater, of the special-status plants that are impacted. Impacts could include direct impacts resulting from loss of habitat or indirect impacts if a significant population or portion thereof is unable to be avoided. Habitat shall be preserved by using permanent open space easements. Mitigation lands cannot be located on land that is currently publicly held.

- Mitigation lands may include (depending on the habitat requirements of particular species) the following:
  - Areas outside the Project boundary, but within the County Preservation areas within portions of the Project Site that are at least 100 feet from Project facilities and are either (1) not permanently impacted by construction and operation of the Project, or (2) are temporarily disturbed and then restored according to the requirements in Mitigation Measure Criteria for appropriate mitigation land are species-specific; however, the following factors must be considered in assessing the quality of potential mitigation habitat: (1) Current land use; (2) Location (e.g., habitat corridor, part of a large block of existing habitat, adjacency to source populations, proximity to Project facilities or other potential sources of disturbance); (3) Vegetation composition and structure; (4) Slope; (5) Soil composition and drainage; and (6) Level of occupancy or use by relevant species.
  - The Applicant shall either provide open space easements or provide funds for the acquisition of open space easements to a "qualified easement holder" (defined below). CDFW is a qualified easement holder. To qualify as a "qualified easement holder" a private land trust must have the following:
    - Substantial experience managing open space easements that are created to meet mitigation requirements for impacts to special status species
    - Adopted the Land Trust Alliance's Standards and Practices
    - A stewardship endowment fund to pay for its perpetual stewardship obligations
- The County shall determine whether a proposed easement holder meets these requirements.
- The County shall determine whether a proposed easement holder meets these requirements.
- The Applicant shall also be responsible for donating to the easement holder fees sufficient to cover: (1) Administrative costs incurred in the creation of the easement (appraisal, documenting baseline conditions, etc.) and (2) Funds in the form of a non-wasting endowment to cover the cost of monitoring and enforcing the terms of the easement in perpetuity. The amount of these administrative and stewardship fees shall be determined by the easement holder in consultation with the County.
- Open space easement(s) shall also be subject to the following conditions:
  - The locations of acceptable easement(s) shall be developed with approval of CDFW and USFWS
  - The primary purpose of the easement(s) shall be conservation of impacted species and habitats, but the easement(s) shall

also allow livestock grazing when and where it is deemed beneficial for the habitat needs of impacted species

- Open space easement(s) shall:
  - Be held in perpetuity by a qualified easement holder (defined above) Be subject to a legally binding agreement that shall: (1) Be recorded with the County Recorder(s); and (2) Name CDFW or another organization to which the easement(s) will be conveyed if the original holder is dissolved.
  - Be subject to the management requirements outlined in Mitigation Measure BR-2.
- If lands acquired or protected for the compensation of permanent impacts to wildlife and/or vegetative communities contain similar sized populations of the impacted special-status plant species, of equal or greater habitat value, these mitigation lands may be used to achieve the required compensation ratios for special status plant species.

**BR-13: Complete Focused Pre-Construction Surveys for American Badger and Desert Kit Fox Surveys and Implementation of Avoidance Measures**

- No more than 30 days prior to the commencement of construction activities, the Applicant shall retain a qualified biologist to conduct pre-construction surveys for American badger and desert kit fox within suitable habitat on the Project Site. If present, occupied dens shall be flagged and ground-disturbing activities avoided within 50 feet of the occupied den. Maternity dens shall be avoided during pup rearing season (15 February through 1 July) and a minimum 200-foot buffer established. The extent of buffers shall be flagged in the field utilizing a method highly visible by construction crews. Buffers may be modified with the concurrence of the CDFW. Maternity dens shall be flagged for avoidance, identified on construction maps, and a biological monitor shall be present during construction to monitor for adequate protection of all identified dens and to help ensure that all flagging is kept in good working order.
- If avoidance of a non-maternity den (impacts to maternity dens is not allowed) is not feasible, badgers or foxes shall be relocated by slowly excavating the burrow (either by hand or mechanized equipment under the direct supervision of the biologist, removing no more than 4 inches at a time) before or after the rearing = season (15 February through 1 July). Any passive relocation of badgers or foxes shall occur only after consultation with the CDFW and the biological monitor.
- Prior to the final County inspection or occupancy, whichever comes first, a written report documenting all badger related activities (e.g., den flagging, monitoring, badger removal, etc.) shall be provided to the County. A copy of the report will also be provided to the CDFW.

#### **BR-14: Pre-Construction Surveys and Avoidance/Relocation Measures for Flat-tailed Horned Lizard**

- Focused pre-construction surveys shall be conducted for flat-tailed horned lizard. During construction, areas of active surface disturbance shall be surveyed periodically, at least hourly, when surface temperatures exceed 29°C (85°F) for the presence of flat-tailed horned lizard. Flat-tailed horned lizards would be removed from harm's way during construction activities by the on-site biological monitor(s). To the extent feasible, methods to find flat-tailed horned lizards would be designed to achieve a maximal capture rate and would include, but not be limited to using strip transects, tracking, and raking around shrubs. During construction, the minimum survey effort would be 30 minutes per 0.40 hectare (one acre). Persons that handle flat-tailed horned lizards would first obtain all necessary permits and authorization from the CDFW. A Horned Lizard Observation Data Sheet and a Project Reporting Form, per Appendix 8 of the Range wide Management Strategy, would also need to be completed. During construction, quarterly reports describing flat-tailed horned lizards removal activity would be submitted to the USFWS, CDFW, and the County.
- The removal of flat-tailed horned lizard out of harm's way would include relocation to nearby suitable habitat in low-impact areas of the Yuba Management Area, which is located to the west and south of the Project Site. Relocated flat-tailed horned lizards would be placed in the shade of a large shrub in undisturbed habitat. If surface temperatures in the sun are less than 24°C (75°F) or exceed 38°C (100°F), a qualified biologist, if authorized, would hold the flat-tailed horned lizard for later release. Initially, captured flat-tailed horned lizards would be held in a cloth bag, cooler, or other appropriate clean, dry container from which the lizard cannot escape. Lizards would be held at temperatures between 75°F and 90°F and would not be exposed to direct sunlight. Release would occur as soon as possible after capture and during daylight hours. The qualified biologist would be allowed some judgment and discretion when relocating lizards to maximize survival of flat-tailed horned lizards found in the Project area.
  - To the maximum extent practicable, grading in flat-tailed horned lizard habitat would be conducted during the active season, which is defined as March 1 through September 30, or when ground temperatures are between 24°C (75°F) and 38°C (100°F). If grading cannot be conducted during this time, any flat-tailed horned lizards found would be removed to low-impact areas (see above) where suitable burrowing habitat exists, (e.g., sandy substrates and shrub cover).

#### **BR-15: Compensation for Impact to Flat-Tailed Horned Lizard**

- Pursuant to Title 43 CFR and the Federal Land Policy and Management Act of 1976, federal land management agencies may permit actions that

result in flat-tailed horned lizard habitat loss on their lands; however, for losses both within and outside the Management Areas, compensation is charged if residual effects would occur after all reasonable on-site mitigation has been applied. The goal of compensation is to prevent the net loss of flat-tailed horned lizard habitat and make the net effect of a project neutral or positive to flat-tailed horned lizards by maintaining a habitat base for flat-tailed horned lizards. To achieve this goal, compensation will be based on the acreage of flat-tailed horned lizard habitat lost after all reasonable on-site mitigation has been applied at a 1:1 ratio for habitat lost outside a flat-tailed horned lizard Management Area. For this Project, compensation will be required for a loss of approximately 54 acres of flat-tailed horned lizard habitat.

**BR-16: Develop a Habitat Mitigation and Monitoring Plan**

- To help ensure the success of on-site preserved land and acquired mitigation lands, required for compensation of permanent impacts to vegetative communities and listed or special-status plants and wildlife, the Applicant shall retain a qualified biologist to prepare a Habitat Monitoring and Mitigation Plan (HMMP). The HMMP will be submitted to the County for approval, prior to the issuance of a construction permit. Prior to the final County inspection final impact acreages must be presented to the County and acquisition of off-site lands must be verified.
- The HMMP will include, at a minimum, the following information:
  - Summary of anticipated habitat impacts and the proposed mitigation.
  - Detailed description of the location and boundaries of undisturbed Project areas proposed for preservation, off-site mitigation lands and a description of existing site-wide conditions. The HMMP shall include detailed analysis showing that the mitigation lands meet the performance criteria outlined in MM BR-2 (Develop a Habitat Restoration Plan) and MM BR-15 (Compensate for Impacts to Flat-Tailed Horned Lizard).
  - Discussion of measures to be undertaken to enhance (e.g., through focused management) the on-site preserved habitat and off-site mitigation lands for listed and special-status species.
  - Description of management and maintenance measures (e.g., vegetation management, fencing maintenance, etc.).
  - Discussion of habitat and species monitoring measures for on-site preservation areas and offsite mitigation lands, including specific, objectives, performance criteria, monitoring methods, data analysis, reporting requirements, monitoring schedule, etc.
  - Development of a monitoring strategy for the monitoring of indirect impacts to vegetation and wildlife from alteration to the solar and hydric regimes as a result of Project facilities.

- Development of a monitoring strategy, which shall serve to document the persistence of flat-tailed horned lizard populations within the Project Site and on mitigation lands. This monitoring will be conducted for a minimum of 5 years after the completion of construction activities. The strategy should include, at the minimum, the following:
  - Documentation of pre-Project population levels for the species noted above, based on results of focused pre-construction surveys and previously supplied Applicant data.
  - On-going monitoring of species populations upon completion of construction activities, while the Project is in operation, for a minimum of three years.
  - Monitoring of reference populations for this species in areas that contain undisturbed habitat, such as the Yuba Management Area.
  - An analysis of the comparison of percent changes in population levels at the Project and reference sites to be used in the determination of additional compensatory mitigation.
  - The applicant shall prepare a contingency plan for mitigation elements that do not meet performance or final success criteria within 5 years. This plan will include specific triggers for remediation if performance criteria are not being met and a description of the process by which remediation of problems with the mitigation site (e.g., presence of noxious weeds) will occur.

#### **BR-17: Burrowing Owl Protection Measures**

- The following measures shall be implemented during Project construction, operation, and decommissioning with respect to burrowing owls:
  - A qualified biologist(s) shall be on-site during all construction activities in suitable burrowing owl habitat. A qualified biologist (i.e., a biologist with previous burrowing owl survey experience) shall conduct pre-construction clearance surveys of the permanent and temporary impact areas to locate active breeding or wintering burrowing owl burrows no more than 14 days prior to construction. The survey methodology shall be consistent with the methods outlined in the CDFG Staff Report (CDFG 2012). Copies of the survey results shall be submitted to CDFW and the County.
  - If no burrowing owls are detected, no further mitigation is necessary. If burrowing owls are detected, no ground-disturbing activities, such as road construction or facility construction, shall be permitted except in accordance with the staff report or by written authorization of CDFW staff. Burrowing owls shall not be excluded from burrows unless or until a Burrowing Owl Exclusion Plan is developed by the lead biologist and approved by the applicable local CDFW office and submitted to the

County. The plan shall adhere to the requirements set forth in the Burrowing Owl Mitigation Staff Report (CDFW 2012).

- In accordance with the Burrowing Owl Exclusion Plan, a qualified biologist shall excavate burrows using hand tools. Sections of flexible plastic pipe or burlap bag shall be inserted into the tunnels during excavation to maintain an escape route for any animals inside the burrow. One-way doors shall be installed at the entrance to the active burrow and other potentially active burrows within 160 feet of the active burrow. Forty-eight hours after the installation of the one way doors, the doors can be removed, and ground-disturbing activities can proceed. Alternatively, burrows can be filled to prevent reoccupation.
- During construction activities, monthly and final compliance reports shall be provided to CDFW, the County, and other applicable resource agencies documenting the effectiveness of mitigation measures and the level of burrowing owl take associated with the Project.

#### **BR-18: Compensation for Impacts to Burrowing Owl**

- Should burrowing owls be found on-site, compensatory mitigation for lost breeding or wintering habitat shall be implemented on-site or off-site in accordance with Burrowing Owl Mitigation Staff Report guidance and in consultation with CDFW.
- At a minimum, the following recommendations shall be implemented:
  - Temporarily disturbed habitat shall be restored, if feasible, to pre-Project conditions, including decompaction soil and revegetating.
  - Permanent impacts to nesting, occupied and satellite burrows, and burrowing owl habitat shall be mitigated such that the habitat acreage, number of burrows, and burrowing owl impacted are replaced at a 1:1 ratio based on a site-specific analysis that shall include the following:
  - Permanent conservation of similar vegetation communities to provide for burrowing owl nesting, foraging, wintering, and dispersal (i.e., during breeding and nonbreeding seasons) comparable to or better than that of the impact area, and with sufficiently large acreage, and presence of fossorial mammals.
  - Permanently protect mitigation lands through a conservation easement deeded to a nonprofit conservation organization or public agency with a conservation mission. If the Project is located within the service area of a CDFW-approved burrowing owl conservation bank, the applicant may purchase available burrowing owl conservation bank.

- If the acquired lands or mitigation credits for other wildlife species or vegetation communities can be managed to support burrowing owl, the proposed mitigation lands could be aggregated so that the purchase of mitigation lands for one species could cover all or a portion of the mitigation requirements for the remaining species. Mitigation lands shall not already be public land.
- 

## **S-6 GEOLOGICAL**

### **Inadvertent Discovery**

- In the event that unanticipated paleontological resources or unique geologic resources are encountered during ground-disturbing activities, work must cease within 50 feet of the discovery and a paleontologist shall be hired to assess the scientific significance of the find. The consulting paleontologist shall have knowledge of local paleontology and the minimum levels of experience and expertise as defined by the Society of Vertebrate Paleontology's Standard Procedures (2010) for the Assessment and Mitigation of Adverse Impacts to Paleontological Resources.
- If any paleontological resources or unique geologic features are found within the Project Site, the consulting paleontologist shall prepare a paleontological Treatment and Monitoring Plan to include the methods that will be used to protect paleontological resources that may exist within the Site, as well as procedures for monitoring, fossil preparation and identification, curation of specimens into an accredited repository, and preparation of a report at the conclusion of the monitoring program.

## **S-7 HYDROLOGY**

### **Prepare Stormwater Pollution Prevent Plan and Implement Best Management Practices**

- Prior to issuance of any grading permit, the Applicant or its contractor shall prepare a Project-specific SWPPP and be responsible for securing coverage under SWRCB's NPDES stormwater permit for general construction activity (Order 2009-0009-DWQ). The SWPPP shall detail the treatment measures and BMPs to control pollutants that shall be implemented and complied with during both the construction and decommissioning of the Project. Example BMPs may include but are not limited to the following practices:
  - Designation of restricted-entry zones
  - Sediment tracking control measures (e.g., crushed stone or riffle metal plate at construction entrance)
  - Truck wash down areas
  - Diversion of runoff away from disturbed areas

- Protective measures for sensitive areas, outlet protection
- Provision mulching for soil stabilization during construction, and provision for revegetation upon completion of construction within a given area
- Treatment measures to trap sediment once it has been mobilized, such as straw bale barriers, straw mulching, fiber rolls and wattles, silt fencing.

## **HYD-2: Final Project Drainage Plan**

- Prior to issuance of any grading permit, the applicant shall submit a Final Project Drainage Plan. The Drainage Plan shall adhere to the County's Engineering Guidelines Manual, IID "Draft" Hydrology Manual, or other recognized source with approval by the County Engineer to control and manage the discharge of storm-water to the proposed retention basins. Retention basins shall be integrated into the Drainage Plan to the maximum extent practical. The Drainage Plan shall provide both short- and long-term drainage solutions to ensure the proper sequencing of drainage facilities and management of runoff generated from the Project's impervious surfaces, as necessary.

## **S-8 CULTURAL**

### **Workers Environmental Awareness Program (WEAP)**

- A qualified archaeologist shall be retained to prepare a cultural resource focused Workers Environmental Awareness Program (WEAP) training that shall be given to all ground disturbing construction personnel to minimize harm to undiscovered archaeological resources or potential tribal resources that may be discovered during construction. All Site workers shall be required to complete WEAP Training with a focus on cultural resources, including education on the consequences of unauthorized collection of artifacts and that reviews discovery protocol. WEAP training shall also explain the protocol for notification, and requirements to retain a qualified archaeologist to evaluate any unexpected finds, as well as protocols regarding notification of tribal representatives.

### **CULT-2: Continued Consultation with the San Pasqual Band of Mission Indians**

- If no other responses to Imperial County's invitation to consult on the Project are received, prior to construction, the County shall continue consultation with the San Pasqual Band of Mission Indians (San Pasqual). If the County, as the lead agency, determines through continued

consultation that there is substantial evidence the Project may adversely impact a yet unidentified Tribal Cultural Resource that meets criteria established in Public Resources Code Section 5024.1, the County shall determine if measures are needed to minimize potential impacts to TCRs including:

- Requirements for Native American Monitoring of Project Ground Disturbing Activities
- Development of an Unexpected Discovery Plan for Archaeological Resources
- Development of a Treatment Plan for Artifacts Considered to be Tribal Cultural Resources.
- If the County, through continued consultation efforts, determines there is not substantial evidence to support the existence of potential TCRs at the Project site, no additional measures shall be required.

#### **S-9 HEALTH, SAFETY AND HAZARDOUS MATERIAL/FIRE AND FUELS MANAGEMENT**

- All trash and debris within the Project site shall be disposed of off-site, in accordance with current, local, state, and federal disposal regulations. Compliance with this measure shall be verified by the Planning and Development Services Department.
- If it is determined that hazardous wastes are, or will be generated by the proposed operations, the wastes must be managed in accordance with the California Hazardous Waste Control Law (California Health and Safety Code, Div 20, Chapter 6.5) and the Hazardous Waste Control Regulations (California Code of Regulations, Title 22, Division 4.5).
- If it is determined that hazardous wastes will be generated, the Permittee should also obtain a United States Environmental Protection Agency, Identification Number by contacting (800) 618-6942. Certain hazardous waste treatment processes or hazardous material, handling, storage or uses may require authorization from the local Certified Unified Program Agency (CUPA). Information about the requirement for authorization can be obtained by contacting the local CUPA.
- Firearms shall be prohibited in all Project areas except for those used by licensed security personnel.
- Prior to the demolition of any building, structure, or transit pipe, the Applicant shall hire a California Certified Lead Inspector/Assessor and Certified asbestos Consultant to evaluate these features for the presence of lead based paint (LBP) and/or asbestos containing materials (ACM). Confirmed LBP and/or ACM shall be handled by a licensed LBP contractor and/or Licensed Asbestos Contractor.

- All contaminants shall be remediated in compliance with California environmental regulations and policies. LBP and/or ACM shall be disposed of according to appropriate regulations.

**S-10 PUBLIC SERVICES:**

- During the development phase of the project, the Permittee shall provide a roster of employees to include their position and place of residence. Permittee shall also attempt to coordinate a ride-share program with Caltrans and other regional employers to facilitate the employment of Imperial County residents in jobs related to this project.
- Unless prohibited by local, state or federal law or regulation, Permittee shall make good faith efforts to hire qualified residents of the Imperial County with the objective that a majority of the total work force is comprised of the Imperial County residents.
- Permittee shall enter into a Development Agreement with the County of Imperial to provide for a monetary benefit payable to the County to maximize the benefits of the Project to the Imperial County prior to the issuance of the first Building/Grading permit.
- All construction supervisors and supervisors shall be provided with communication devices, cell phones or walkie-talkies, in the event of an emergency on-site.

**S-11 COMMENCEMENT OF WORK:**

- Permittee shall commence construction of the permitted activities or provide substantial evidence of substantial progress within twenty-four (24) months of the effective date of this permit, i.e. approval date. Permittee may request an extension which shall be granted if the Permittee can show necessity.
- If a Development Agreement is approved, permitting will extend for a period of ten (10) years for the commencement of work.

**S-12 CONSTRUCTION STANDARDS**

- The battery storage facility structures shall be built in accordance with the California Building Code requirements applicable to "Seismic Category D". All structures and facilities shall be designed in accordance with the publication entitled "Recommended Lateral Force Requirements and Commentary by the Structural Engineers Association of California".
- The structural components of the permitted facilities shall be reviewed by the Building Official/Planning and Development Services Director. Applicable building permits shall be procured from the County for facilities prior to commencement of construction of such facilities.

**S-13 EMERGENCY RESPONSE/ACTION PLAN:**

- The Permittee shall prepare an Emergency Response/Action Plan that has been approved by the Imperial County Fire/OES Department, and the Local Enforcement Agency. Any hazardous materials storage areas shall be designed with curbs or other containment measures, e.g. double-walled storage tanks, to contain spills and leaks and if on-site hazardous materials exceed 55 gallons, a "Hazardous Material Management Plan" shall be prepared and approved by the County LEA and CUPA.
- The Emergency Response/Action Plan shall cover all possible emergencies, e.g. major fluid spills, earthquakes, fires, floods or other emergencies. At all times, there shall be at least one employee either on the facility premises or on-call (i.e., available to respond to an emergency by reaching the facility within a short period of time) with the responsibility of coordinating all emergency response measures. This Emergency Coordinator shall be thoroughly familiar with all aspects of the solar facility's Emergency Response/Action Plan, all operations and activities at the facility, location of all records within the facility and the facilities layout. This person shall have the authority to commit the resources needed to carry out the contingency plan. Adequate personnel and equipment shall be available to respond to emergencies and to insure compliance with the conditions of the permit.

- The Emergency Response/Action Plan shall be prepared in consultation with, but not be limited to, the Imperial County Fire Protection/Office of Emergency Services, County Environmental Health Services/Health Department, County Sheriff/Coroner's office, County Public Works Department, Planning and Development Services Department, and other appropriate state and county agencies. The plan shall include a notification list of response agencies which shall be notified immediately upon the discovery of a reportable unauthorized discharge and the list shall include: Imperial Fire Protection/Office of Emergency Services, Planning and Development Services Department, County Environmental Health Services/Health Department, County Department of Public Works (DPW), California Highway Patrol, as applicable.
- All employees shall be trained by classroom and hands-on training on safety procedures, maintenance programs and emergency response protocols to ensure safety and reliability in the event of an unforeseen emergency situation.
- The Permittee shall provide adequate safety devices against the hazard of fire and explosion for activities that involve the use and storage of flammable, explosive or highly corrosive or reactive materials as well as provide adequate fire-fighting and fire suppression equipment and using devices standard within the industry in compliance with all applicable state and local laws as verified by the Fire Chief, Office of Emergency Services.
- The Permittee shall implement all State and County-approved worker safety and fire protection plans and programs.
- Any gates on-site shall have a "knock" lock and be rapidly accessible by the Imperial Fire Protection/Office of Emergency Services.
- Appropriate first aid provisions for facility operations shall be made for emergency response during Project construction, operation, and maintenance activities with appropriate first aid training for Project employees.
- During construction, a member of each working crew shall be trained in basic first aid and supplied with necessary medical equipment to respond to emergencies as provided for in the Emergency Response/Action Plan required above.
- Permittee shall identify a responsible agent for emergency purposes, whose name, title, e-mail address and telephone number, which shall be provided to the County Department of Public Works, County Fire Protection/OES Department, County Environmental Health Services/Health Department, County Sheriff/Coroner's office, Imperial Irrigation District (IID), and County Planning and Development Services Department.

#### **S-14 LAND USE IMPROVEMENTS**

1. The Permittee shall prepare an appropriate parking plan for review and approval by the County Planning and Development Services and County Public Works Department for all proposed Operation & Maintenance buildings.
2. The Permittee shall surface with a minimum of three (3) inches of asphaltic concrete paving or material of higher quality all access drives, parking areas, and vehicular maneuvering areas to any constructed operation and maintenance buildings.

#### **S-15 NOISE STANDARDS:**

1. During the construction period, heavy truck traffic to/from the solar facilities shall be limited to the hours between 7:00 AM and 7:00 PM Monday through Friday, and 9:00 AM to 5:00 PM on Saturdays.
2. During construction, in accordance with Imperial County Noise Element of the General Plan, the noise level shall not exceed 70 dBA<sub>Leq</sub> at the property boundary when averaged over an 8-hour period.
3. Noise associated with project operation would attenuate to less than 50 dB(A) <sub>Leq</sub> within the Project site boundary. On-site generated noise would attenuate to 44 dB(A) <sub>Leq</sub> at the nearest single-family residence immediately (west of the intersection of Drew Road and SR 98).

#### **S-16 ODOR CONTROL**

1. The Permittee shall control all odor-causing, harmful, noxious emissions to ensure that quantities or air contaminants released as a result of the permitted facilities do not exceed County, State or Federal standards, nor constitute a public nuisance, per the Land Use Ordinance, Division 13, Enforcement, Chapter 2, Abatement of Nuisances, Sections 91302.00 through 91301.02.

#### **S-17 PLAN APPROVALS:**

Permittee shall submit to the County Planning and Development Services Department, architectural, landscaping and lighting plans prior to construction of those facilities, to include painting of structures, planting of trees and/or vegetation, and shall receive all approvals prior to commencing construction of the applicable permitted facilities. Approval shall not be unreasonably withheld so long as the plans are consistent with applicable Land Use Ordinance requirements.

**S-18 PROJECT DESIGN:**

1. All facility access and parking areas shall be constructed to the standards of the Land Use Ordinance.
2. All permitted activities shall provide for the minimum feasible surface land disturbance for compatibility with the existing uses wherever possible.
3. All equipment and electrical interconnection facilities used at the project site shall be maintained in a manner that prevents breaking, cracking, and leaking, e.g. operator staffing and training, including appropriate quality assurance procedures, with the operation of back-up or auxiliary facilities when necessary.
4. A Storm-water Pollution Prevention Plan (SWPPP) shall be prepared for construction of the project in accordance with the requirements of the County of Imperial and the RWQCB (Hydrology and Water Quality).
5. All on-site basins shall be designed and constructed under the supervision of a California-licensed Civil Engineer meeting sound engineering standards, with all applicable regulations and all requirements of the County Environmental Health Services/Health Department and Public Works Departments are complied with.
6. Obtain encroachment permits for any construction or operation on IID existing right of way or easements.

**S-19 REPORTING AND MONITORING:**

1. The Permittee shall furnish to the County, within a reasonable time, any relevant reports/information which the County requires for monitoring purposes to determine whether cause exists for revoking this permit, or to determine compliance with this permit. The Permittee shall submit all required reports to the Planning Director, County Planning and Development Services Department, 801 Main Street, El Centro, CA 92243.
2. Permittee and Imperial County Development Services Department Director shall agree upon a third-party environmental consultant for overseeing all the required mitigation, conditional use permit conditions and public benefit agreement requirements during the construction of project.
3. Permittee shall pay for this third-party environmental consultant monitoring and compliance through a memorandum of understanding (MOU) between the County of Imperial, the Permittee and the third party consultant. This environmental consultant shall oversee and manage the

entire team of specialists needed for the environmental compliance of project, i.e. biologist, cultural experts, burrowing owls monitoring, etc.

4. The Planning and Development Services Department, in consultation with the third-party Environmental Consultant and the County Executive Office, will require that all mitigation measures be satisfied, all mitigation monitoring and Reporting Program requirements have been satisfied, all Conditions of Approval in the Conditional Use Permit are in full compliance and all conditions of the Development Agreement have been satisfied before the Final Certificate of Occupancy Certificate is issued.
5. During the operation of the project, an Annual Compliance Report shall be submitted to the Planning & Development Services Department, documenting the implementation of the conditions and general measures as well as any resource-specific measures.
6. The Permittee shall reimburse the Imperial County Planning & Development Services Department for monitoring and investigations related to the construction and operation of the Project. Permittee shall compensate the County pursuant to the Imperial County Planning & Development Services Department Fee Schedule for any costs incurred.
7. Permittee shall pay for all costs as required to comply with the Conditions of Approval, and shall implement all required mitigation measures as indicated in the Final Environmental Impact Report (FEIR) and Mitigation Monitoring, Reporting Program (MMRP). If mitigation measures for FEIR and MM&RP are more stringent than the conditions in this permit, the FEIR & MM&RP mitigations will be required.

#### **S-20 SPILLS AND RUNOFF:**

The Permittee shall design and construct the permitted facilities to prevent spills from endangering adjacent properties and to prevent runoff from any source being channeled or directed in an unnatural way so as to cause erosion, siltation, or other detriments pursuant to the construction Storm Water Pollution Prevention Plan approved by the Regional Water Quality Control Board.

#### **S-21 FACILITIES CLOSURE AND SITE RESTORATION:**

1. Permittee shall implement the site restoration plan as outlined within the plan when the operation of the permitted facilities herein authorized has ceased, all facilities shall be dismantled, and the lands involved restored to their pre-construction condition and available for agricultural production uses as agreed to by the County Planning and Development Services

Director. Prior to issuance of a building or grading permit, a Bond, or other acceptable surety, in the amount of the estimated site restoration financial calculations/bond, for the developed project area as specified in the [or grading plan(s) area], or other forms of security acceptable to County Counsel's office, shall be filed with the County that guarantees restoration of the land. Upon completion of such site restoration, and demonstration that the land has been restored per the reclamation plan, the Bond or other surety shall be released by the County.

2. The above financial calculations/bond shall be reviewed every five (5) years in December and adjusted on January 1<sup>st</sup> to add a CPI (Los Angeles) increase by the Planning and Development Services Director. This readjustment can be made in the County's sole discretion if approved by both the County and the Permittee.

#### **Reclamation/Decommissioning Plan and Security**

- Prior to the issuance of a grading permit or building permit (whichever is issued first) for the proposed Project, the Permittee shall submit to Imperial County a Reclamation and Decommissioning Plan. The plan shall document the procedures by which each CUP area will be returned to an approved condition. The Permittee shall also provide financial assurance/bonding in an amount equal to a cost estimate prepared by a California-licensed general contractor or civil engineer for implementation of the Reclamation Plan in the event Permittee fails to perform the Reclamation Plan.
- Timing/Implementation: Prior to the issuance of a grading permit and/or building permit (whichever is issued first).
- Enforcement/Monitoring: Imperial County Planning and Development Services Department and Imperial County Agricultural Commissioner's Office.

#### **S-22 PUBLIC WORKS**

1. Any activity and/or work within Imperial County right-of-way shall be completed under a permit issued by this Department (encroachment permit) as per Chapter 12.12 – Excavations on or Near a Public Road of the Imperial County Ordinance.
  - (a) Any activity and/or work may include, but not be limited to, the installation of temporary stabilized construction entrances, primary access driveways, secondary emergency access driveways, site fence installation, underground/overhead electrical crossings, road improvements, temporary traffic control, etc.
  - (b) The applicant for encroachment permits within Imperial County right-of-way, grading plans and/or improvement plans is responsible for researching, protecting and preserving survey monuments per the Professional Land Surveyor's Act (8771 (b)).

This shall include a copy of the referenced survey map and tie card(s) (if applicable) for all monuments that may be impacted.

2. The Permittee will be required to repair any damages caused to County roads by construction traffic during construction and maintain them in safe conditions.
3. All off-site improvements within Imperial County right-of-way shall be financially secured by either a road improvement bond or letter of credit prior to issuance of a grading permit, building permit, and encroachment permit.
4. Prior to the issuance of grading and building permits, the Permittee shall complete the installation of temporary stabilized construction entrances and secondary emergency access driveways.
5. Prior to issuance of final certificate of occupancy, the Permittee shall be responsible for repairing any damage caused to County roads and bridges during construction as determined by the Imperial County Road Commissioner.
6. The Permittee shall furnish a Drainage and Grading Plan/Study to provide for property grading and drainage control, which shall also include prevention of sedimentation of damage to off-site properties. The Study/Plan shall be submitted to the Department of Public Works for review and approval. The Developer shall implement the approved plan. Employment of the appropriate Best Management Practices (BMP's) shall be included. (Per Imperial County Code of Ordinances, Chapter 12.10.020 B).
7. All permanent structures shall be located outside of the ultimate County Right-of-Way.
8. Off-site improvements shall be constructed in compliance with the material specifications, horizontal/vertical alignments and notes of engineered approved project plans and shall conform to County of Imperial Department of Public Works Engineering Design Guidelines Manual.
9. On-site roads shall be constructed of compacted native soils.
10. Primary access and secondary emergency access driveways shall be constructed of asphalt concrete pavement and class II base with a 10-foot section of asphalt concrete pavement adjacent to the County Road existing edge of pavement respectively.

11. No Right-of-way required at this moment. During future phases of the project, right-of-way compliance with the Circulation Element of the General Plan will be addressed.
12. The Permittee shall prepare and submit a haul route study for the proposed construction haul route to evaluate any impacts to County roads. Said study shall be submitted to this Department for review and approval. The haul route study shall include pictures and/or other documents to verify the existing conditions of the impacted County roads before construction begins. The haul route study shall also include recommended mitigation improvements to impacted County roads along with any fair share costs for such improvements.
13. The Permittee shall enter into a Roadway Maintenance Agreement with the County of Imperial prior to issuance of a Certificate of Occupancy. The Permittee shall provide financial security to maintain roads on the approved haul route study during construction.

**INFORMATIVE:**

All solid and hazardous waste shall be disposed of in approved solid waste disposal sites in accordance with existing County, State and Federal regulations (per Imperial County Code of Ordinances, Chapter 8.72)

All on-site traffic areas shall be compacted native soils to provide access for emergency vehicles.

The project may require a National Pollutant Discharge Elimination System (NDPES) permit and Notice of Intent (NOI) from the Regional Water Quality Control Board (RWQCB) prior to County approval of onsite grading plan (40 CFR 122.28).

A Transportation Permit may be required from road agency(s) having jurisdiction over the haul route(s) for any hauls of heavy equipment and/or large vehicles which impose greater than legal loads on riding surfaces, including bridges. (Per Imperial County Code of Ordinances, Chapter 10.12 – Overweight Vehicles and Loads)

**S-23 WASTE DISPOSAL**

1. The Permittee shall insure that all project waste, liquid, gas or solid, which are generated on-site shall be disposed of in compliance with appropriate local, state, and federal regulations, in effect or as subsequently duly-enacted. All solid waste debris and/or any hazardous wastes located on the Project site must be satisfactorily removed to a permitted facility prior to the commencement of grading earthen material at the site.
2. Littering shall not be allowed. Project personnel shall not deposit or leave any food or waste in the Project area, and no biodegradable or non-biodegradable debris shall remain in the right-of-way or on the Project site following completion of construction.

**S-24 DEPARTMENT OF TOXIC SUBSTANCES CONTROL:**

1. If there are any recognized environmental conditions in the project area, then proper investigation, sampling and remedial actions overseen by the appropriate regulatory agencies should be conducted prior to the new development or any construction.
2. If during construction/demolition of the project, soil and/or groundwater contamination is suspected, construction/demolition in the area would cease and appropriate health and safety procedures should be implemented. If it is determined that contaminated soil and/or groundwater exist, the IS should identify how any required investigation and/or remediation will be conducted, and the appropriate government agency to provide regulatory oversight.
3. If soil contamination is suspected or observed in the project area, then excavated soil should be sampled prior to export/disposal. If the soil is contaminated, it should be disposed of properly in accordance with all applicable and relevant laws and regulations. In addition, if the project proposes to import soil to backfill the excavated areas, proper evaluation and/or sampling should be conducted to make sure that the imported soil is free of contamination.

**S-25 COLORADO RIVER INDIAN TRIBES:**

1. The Tribe requests that all prehistoric cultural resources, including both known and yet-to-be discovered sites, be avoided if feasible. If avoidance is infeasible, then the Tribe requests that the resources be left in-situ or reburied in a nearby area, after consultation.
2. In the event any human remains or objects subject to provision of the Native American Graves Protection and Repatriation Act, or cultural resources such as sites, trails, and artifacts are identified during ground disturbance, please contact CRIT Tribal Historic Preservation Office (THPO) within 48 hours.

**IMPERIAL IRRIGATION DISTRICT:**

1. For temporary construction electrical service and permanent electrical service to the on-site substation and the battery storage facility, the applicant should contact the IID Customer Project Development Office and speak with the area's project manager. All associated fees, rights of way and environmental documentation is the responsibility of the applicant.<sup>3</sup>
  2. A circuit study may be required prior to IID committing to serve the project.
  3. A comprehensive IID hydraulic drain system analysis will be required to determine impacts and mitigation if the project discharges into IID's drain system. IID's hydraulic drainage system analysis includes an associated drain impact fee.
  4. To obtain water for the construction phase of the projects, the applicant should be advised to contact IID South End Division.
  5. The IID Water Department will require that the applicant secure with the district the necessary Water Supply Agreements for industrial use.
  6. IID's canal or drain banks may not be used to access the project sites. Any abandonment of easements or facilities shall be approved by IID based on system (Irrigation, Drainage, Power, etc.,) needs.
  7. Any construction or operation on IID property or within its existing and proposed right of way or easements including but not limited to: surface improvements such as proposed new streets, driveways, parking lots, landscape; and all water, sewer, storm water, or any other above ground or underground utilities; requires a lease, an encroachment permit, or encroachment agreement.
  8. IID claims a prescriptive right of way to the toe of slope of all existing canals and drains. Where space is limited and depending upon the specifics of adjacent modifications, the IID may claim additional secondary easements/prescriptive rights of ways to ensure operation and maintenance of IID's facilities can be maintained and are not impacted.
  9. Approved grading, drainage and fencing plans should be submitted to the IID Water Engineering Section prior to final project design as well as the project's Storm Water Pollution Prevention Plan.
-

## **S-27 FIRE DEPARTMENT**

- o Standards and requirements for energy storage system include, but are not limited to, the following:
  - NFPA:
    - 1 Fire Code
    - 68 Standard on Explosion Protection by Deflagration Venting
    - 69 Standard on Explosion Prevention Systems.
    - 70 National Electrical Code
    - 855 Standard for the installation of Energy Storage System
    - 111 Stored Electrical Energy Emergency and Standby Power System
    - 1072: Standard for Hazardous Materials/Weapons of Mass Destruction Emergency Response Personnel Professional Qualifications.
    - 1710 Standard for Organization and Deployment of Fire Suppression Operations, Emergency Medical Operations, and Special Operations to the Public by Career Fire Departments.

### **OSHA:**

- 29 CFR 1910.134(g)(4)
- 29 C.F.R. 1910.1000. Limits for Air Contaminants. Regulation, Occupational Safety and Health Administration

### **CFC:**

- Chapter 1 section
- Chapter 12 section 1206 Electrical Energy Storage System
- Chapter 9 Fire Protection and Life Safety System

### **UL:**

- UL 9540 Standard for Energy Storage Systems and Equipment.
- UL 9540A Test Method for Evaluating Thermal Runaway Fire Propagation in Battery Energy Storage Systems

### **NFPA:**

- 1710 Chapter 5 section 5.2.3.1.2.1 states: In first –due response zones with tactical hazards, high hazard occupancies, or dense urban areas, as identified by the AHJ, these fire companies shall be staffed with a minimum of six on duty members. OSHA 29 CFR 1910.134(g)(4) states: Procedures for interior structural firefighting. In addition to the

requirements set forth under paragraphs (g)(3), in interior structural fires, the employer shall ensure that:

- 1910.134(g)(4)(i): At least two employees enter the IDLH atmosphere and always remain in visual or voice contact with one another.
- 1910.134(g)(4)(ii): At least two employees are located outside the IDHL atmosphere; and 1910.134(g)(4)(iii): All employees engage in interior structural firefighting use SCBAs.

1. Additional requirements to follow but not limited to:

- An approved water supply capable of supplying the required fire flow determined by appendix B of the 2019 California Fire Code shall be installed and maintained. Private fire service mains and appurtenance shall be installed in accordance with NFPA 24.
- An approved automatic fire suppression system shall be installed on all required structures as per the 2019 California Fire Code. All fire suppression systems will be installed and maintained to the current adapted fire code and regulations.
- An approved automatic fire detection system shall be installed on all required structures as per the 2019 California Fire Code. All fire detection systems will be installed and maintained to the current adapted fire code and regulations.
- Fire department access roads and gates will be in accordance with the current adopted fire code and the facility will maintain a Knox Box for access on site.
- Compliance with all required sections of the fire code.
- Applicant shall provide product containment areas(s) for both product and water run-off in case of fire applications and retained for removal.
- A Hazardous Waste Material Plan shall be submitted to Certified Unified Program Agency (CUPA) for their review and approval.
- All hazardous material and wastes shall be handled, store, and disposed as per the approved Hazardous Waste Materials Plan. All spills shall be documented and reported to Imperial County Fire Department and CUPA as required by the Hazardous Waste Material Plan.
- Westside Battery Storage reviews for plans and inspections will be done by a third-party consultant determined by the Fire Department at the applicant's expense as per California Fire Code Chapter 1 [A] 104.7.2 Technical Assistance.

- Prior to the issuance of the first grading permit for the Project, Developer shall purchase, or contribute its proportionate share associated with the cost of the purchase, of a Type 1 fire engine, which shall meet all National Fire Protection Association ("NFPA") standards for structural firefighting. Final cost, conditions, and equipment to be installed on the Type 1 fire engine shall be reasonably determined by County Fire/OES, but the total cost shall not exceed five hundred thousand dollars (\$500,000). The terms and reimbursement schedule for this Type 1 fire engine are more fully described in the Development Agreement dated.
- Project will provide a private fire line with fire hydrants every 300 feet or to the discretion of the Fire Department and will maintain fire flows that will be analyzed by the Fire Department for final gallons per minute and duration. Developer shall pay County Fire/OES one hundred dollars (\$100) per megawatt of storage capacity at point of interconnection as a one-time payment to provide additional training to Fire/OES personnel during the life of the Project. The nature and frequency of such training shall be at the discretion of County Fire/OES, but shall be intended for assisting with responses to utility-grade energy storage project fires and emergencies. This payment shall be made before issuance of the first building permit for the Project, or for each phase of the Project, whichever is applicable.
- Developer shall pay County Fire/OES one hundred fifty dollars (\$150) per megawatt of storage capacity at point of interconnection as a one-time payment to provide additional equipment for Fire/OES personnel during the life of the Project. The type and amount of equipment required shall be at the discretion of County Fire/OES, but shall be intended for assisting with responses to utility-grade energy storage project fires and emergencies. This payment shall be made before issuance of the first building permit for the Project, or for each phase of the Project, whichever is applicable.
- Signage that identifies the contents of an ESS is required on all ESS installations to alert first responders to the potential hazards associated with the installation.
- Lithium-ion battery ESSs must incorporate adequate explosion prevention protection as required in NFPA 855 or International Fire Code Chapter 12, where applicable, in coordination with the emergency operations plan.
- Permittee shall contract with an environmental consultant and pay for a Compliance Construction Manager for overseeing all the required mitigation and conditional use permit conditions during the construction of project. This Compliance Construction Manager shall oversee and manage the entire team of specialists needed for the environmental compliance of project, i.e. biologist, cultural experts, burrowing owls monitoring, etc.

- CED Westside Canal Battery Storage, LLC shall be the master developer and shall be responsible as for all improvements, septic, water plant, roads and other improvements, Conditional Use Permit Application and Conditions, MND, and MM&RP.
- If CED Westside Canal Battery Storage, LLC sells all or part of this project, an approved agreement shall be in place for new owner to build and maintain as agreed to by the previous conditions. The Planning and Development Services Director shall approve of any agreement between permittee and a new master developer.

## **S-28 FIRE TRAINING**

1. Applicant/Permittee will offer to County Fire the opportunity to participate in annual or as necessary/required update training on the handling of Hazardous Materials at such times as it is offered to staff. This offer extends to first responders as determined by County Fire.
2. Applicant/ Permittee will provide appropriate training for the handling of the various materials, chemicals and/or hazardous materials that may be used at the plant. This training would include first responder training to an incident. This training will be made available to County Fire Department personnel and such other personnel as deemed necessary by County Fire, including but not limited to first responders, mutual aid responders etc.

## **S-29 SALES TAXES BENEFIT**

To the extent permitted by applicable local, state and Federal law, Developer will require that all qualifying contractors and subcontractors exercise their option to obtain a California Department of Tax and Fee Administration ("CDTFA") sub-permit for the job site, allocate all eligible sales, and use tax payments to County and the Local Transit Authority ("LTA"). Prior to commencement of any construction activity on-site, Developer shall require that the contractor or subcontractor provide County with a copy of their CDTFA account number and sub-permit. Developer shall either cause its construction contractor to treat the Project in accordance with California Sales and Use Tax Regulation 1521(b)(2)(B); California Sales and Use Tax Regulation 1521(c)(13)(B), and California Sales and Use Tax Regulation 1826(b) for sales and use tax purposes. Or, form a "Buying Company" as defined in the California Sales and Use Tax Regulation 1699(h). Developer may adopt an alternate methodology to accomplish this goal if such methodology is approved by the County's Executive Officer prior to issuance of any building permit. No later than forty-five (45) days after the due date for filing sales and use tax returns for each calendar quarter, occurring after the commencement of any construction activity on-site through and including the first anniversary of commercial operating date ("COD"), Developer shall report, or cause its general contractor to report to County, the

total amount of sales and use taxes related to the Project that are allocated to the County, and reported on Developer's, general contractor's and subcontractors' applicable California sales and use tax returns. The obligations of Developer under this Section III A are hereinafter referred to as the "Developer Sales and Use Tax Responsibilities."

**Guarantee Amounts.** Prior to the issuance of any building permit for the Project, Developer shall provide County with a guarantee of the minimum sales and use taxes that will be received by County and LTA under existing applicable sales and use tax laws. The guarantee amount shall be based on the total storage capacity of the Project in megawatts, which is projected to be up to 2,000 megawatts. Should Developer choose to develop the Project in phases and receives the required approvals from County to do so, then Developer shall provide a separate guarantee amount for each phase of the project based on the total storage capacity in megawatts for the applicable phase.

Developer warrants that the sales/use tax guarantee amounts to be provided to County as mandated in this Section shall be true and accurate estimates of the projected sales and use taxes that will be generated for this Project. Developer shall provide County with evidence of the projected sales/use taxes for the Project, including but not limited to sales tax receipts, and executed or anticipated engineering contracts, procurement contracts, and construction contracts. If the Parties are unable to agree upon a guarantee amount, then the dispute shall be referred to an independent accountant mutually acceptable to both Parties. The costs for such nonbinding mediation shall be borne by Developer. Developer warrants that the sales/use tax guarantee amounts to be provided to County as mandated in this Section will incorporate any and all sales/use tax exemptions that Developer and/or its contractors and subcontractors intend to utilize, and that such exemptions will be disclosed to County fully and in good faith prior to the issuance of any building permit for this Project. Developer understands and acknowledges that the sales/use tax guarantee amounts to be provided to County as mandated by this Section are a part of the consideration to be received by County in return for entering into this Agreement, and further understands and acknowledges that County would not enter into this Agreement but for said guarantee from Developer. In the event that County and / or LTA receives less than the amount of sales / use taxes guaranteed pursuant to this paragraph, then Developer shall pay, as and when provided below, to County or LTA as applicable, the amount of the applicable shortfall.

**Adjustments to Guarantee Amounts.** The amount of sales and use tax anticipated to be generated is based on the projected construction of up to two thousand megawatt (2000 MW) battery storage system at full build out of the project. Construction of any additional output capacity beyond the 2000 MW output or storage capacity now projected will require the sales / use tax guarantee amounts to be adjusted based on the actual output from solar generation facilities of the Project as evidenced by any power purchase agreement subsequently entered into by Developer related to this Project.

To the extent of any reduction in the size of the Project as the result of any final ruling, stipulated judgment, or settlement, the sales / use tax guarantee amounts mandated shall be reduced pro rata based on the size of such reduction.

Should Developer become aware of a change in circumstances that would materially affect the sales/use tax guarantee amount, then Developer shall, within forty-five (45) days of learning of such change in circumstances, inform the County in writing of the change in circumstances. If the County determines that such change in circumstances warrants an adjustment to the sales/use tax guarantee amount, then County shall negotiate in good faith with Developer in revising the sales/use tax guarantee amount. If the Parties are unable to agree upon a revised guarantee amount, then the dispute shall be referred to an independent accountant mutually acceptable to both Parties. The costs for such nonbinding mediation shall be borne by Developer. Failure of the Developer to inform the County of the change in circumstances shall constitute a waiver of Developer's ability to seek any adjustment to the sales/use tax guarantee based on such change in circumstances.

The complete sales / use tax guarantee amount due to County and LTA for each phase of the Project must be received within one (1) year after COD for each phase of the Project, or such later date as any applicable sales / use tax is due or is transmitted from the CDTFA, unless it is delayed due to causes beyond Developer's control or for which Developer is not responsible. If, within one (1) year after issuance of the final certificate of occupancy, or such later date as any applicable sales / use tax is due or is transmitted from the CDTFA, the sales / use taxes received by the County are less than the sales / use tax guarantee amounts mandated under paragraph B, then Developer shall pay the difference to the County.

Payments to County and LTA as a result of a shortfall shall be due within forty-five (45) calendar days of Developer's receipt of written notice of shortfall from the County. Failure to make such payment within the forty-five (45) day timeframe shall be considered a default pursuant to section VI paragraph Q. of this Agreement, and may lead to termination of this Agreement. Developer hereby agrees to pay interest at the rate of six percent (6%) per annum of the payment due for any payment received by County beyond the forty-five (45) day due date. The obligation to pay interest shall survive the termination of this Agreement. The obligation to pay interest shall be stayed for up to thirty (30) calendar days when such amounts are disputed in good faith, so long as Developer submits the payments "under written protest" with a complete explanation of the reasons for the protest. Upon resolution of the protested payment, such late charges may be assessed if it is determined by County that the dispute was not made in good faith. Repeated protests of the same point rejected in a prior protest shall be considered a protest in bad faith. Any such payments later found not to be due by Developer shall be refunded by County

promptly, and in all events within thirty (30) calendar days after the determination of the amounts owing is made.

In the event that Developer repowers or replaces the equipment onsite, to the extent permitted under then applicable law, each site shall be designated as the "point of sale" so as to create an additional local tax-funding source for the County of Imperial.

**S-30** The Project commits to design and construct a bridge spanning the Westside Main Canal, which will be owned and maintained by the Project, with access granted to the County for public safety purposes.

**S-31** The Project commits to pay to the County bridge removal funds in the amount of \$150,000 as per the November 13, 2019 Feasibility Report and Cost Estimate for the Lyons and Hyde Bridges. In addition to this \$150,000 amount, there will be an additional \$50,000 commitment to the County in removal funds intended to cover currently unknown removal costs that may not have been discovered or disclosed in the inspection related to the above-referenced Feasibility Report.

**S-32            ACCEPTANCE:**

Acceptance of this permit shall be deemed to constitute agreement by Permittee with all terms and conditions herein contained.

---

1       **NOW THEREFORE**, County hereby issues the Conditional Use Permit #19-0015,  
2 and Permittee hereby accepts such permit upon the terms and conditions set forth herein.

3       **IN WITNESS THEREOF**, the parties hereto have executed this Agreement the day  
4 and year first written.

### Subject: Notice of Preparation of a Draft Environmental Impact Report

<b>Lead Agency:</b>		<b>Consulting Firm:</b>	
<b>Agency Name</b>	Imperial County Planning & Development Services Department	<b>Firm Name</b>	Stantec Consulting Services Inc.
<b>Street Address</b>	801 Main Street	<b>Street Address</b>	290 Conejo Ridge Avenue
<b>City/State/Zip</b>	El Centro, CA 92243	<b>City/State/Zip</b>	Thousand Oaks, CA 91361
<b>Contact</b>	David Black	<b>Contact</b>	Kevin Kohan

The County of Imperial will be the California Environmental Quality Act (CEQA) Lead Agency and will prepare an Environmental Impact Report (EIR) for the proposed project identified below. We need to know the views of your agency as to the scope and content of the environmental information, which is germane to your agency's statutory responsibilities in connection with the proposed project. Your agency will need to use the EIR prepared by our agency when considering your permit or other approval for the proposed project.

The project description, location, and the potential environmental effects are contained in the attached materials. A copy of the Initial Study is attached.

Due to the time limits mandated by State law, your response must be sent at the earliest possible date but ***not later than 35 days*** after the start of the noticing period on **April 13, 2020. The 35-day noticing period ends on May 18, 2020.**

Please send your response to Imperial County Planning & Development Services, Attention: David Black at the address shown above. Please provide a name, title, phone number, and email of the contact person in your agency.

### **Project Title: Westside Canal Battery Storage Project**

**Project Applicant:** Consolidated Edison Development Inc. (CED)

**Project Location and Primary Components:** The Westside Canal Battery Storage Project is proposed for development by Consolidated Edison Development Inc. (CED) and consists of the following primary components:

1) construction of a lithium ion battery and/or flow battery storage facility (herein referred to as "battery energy storage facility") and associated buildings and facilities; 2) permanent vehicular access on both the north and south side of the Imperial Irrigation District's (IID) Westside Main Canal and a bridge over the canal; 3) a loop-in substation with connection to the Campo Verde Imperial Valley 230 kV radial transmission line; and, 4) photovoltaic solar generation facility (herein referred to as "solar facility"). These components are collectively referred to as the "proposed project" or "project."

- **Battery Energy Storage Facility, Solar Facility, and Related Facilities.** The project site is located in Mount Signal in unincorporated Imperial County, approximately 8-miles southwest of the City of El Centro and 5.3-miles north of the United States and Mexico border. The proposed project footprint encompasses two Assessor's Parcels Numbers 051-350-010 and 051-350-011, totaling approximately 148 acres. This area is zoned as Agriculture (A-3). The project site is bounded by the Westside Main Canal to the north,

## Notice of Preparation

---

Bureau of Land Management (BLM) lands to the south and west, and vacant private land to the east (Figure 1).

- **Campo Verde Imperial Valley 230 kV Substation loop-in.** The proposed project includes a new loop-in substation on the site and connects to the existing IID Campo Verde Imperial Valley 230 kV Radial gen-tie line which ultimately connects a one-third mile long gen-tie line into the Imperial Valley substation south of the project site. The proposed project would also access a small portion of Assessor's Parcel Number 051-350-009 for this connection (Figure 2).
- **Permanent Vehicle Access.** The proposed project will utilize two additional parcels on the north side of the Westside Main Canal: Assessor Parcel Number 051-350-019 owned by IID, and Assessor Parcel Number 051-350-018 owned by a private landowner, totally approximately 15.32 acres. This site includes approximately 60 feet of frontage along the north project fence line and south of the IID maintenance road to be used for site and public access. The proposed project includes a Caltrans/County specified bridge to span the Westside Main Canal to connect the project site to Liebert Road to the west.

**Project Description:** The proposed Westside Canal Battery Storage Project involves the construction and operation of a utility-scale energy storage complex with a capacity of approximately 2,000 MW on approximately 163.32-acres of land owned by the Bureau of Land Management (BLM), Imperial Irrigation District (IID), and private landowners. The proposed project will be constructed in 3 – 5 phases over a 10-year period with each phase ranging from approximately 25 MW to 400 MW per phase. Assuming a 10-year development period and 30-year operating life of each phase, the expected end date of the project would be 30 years from the construction of the final phase. The proposed project would be comprised of a lithium ion battery and/or flow battery energy storage facility, solar energy facility, a new 230 kV loop-in substation, underground electrical cables, and permanent vehicular access over a proposed bridge to and from the site. The proposed project includes the connection of the proposed on-site substation to the existing Campo Verde Imperial Valley radial transmission line.

The power produced and stored by the proposed project would be conveyed to the local grid via a proposed loop-in substation on-site, which will be connected into the existing IID Campo Verde 230-kV Radial gen-tie line that ultimately connects to the Imperial Valley Substation. The project applicant has submitted the necessary Interconnection Request Applications to the California Independent System Operator (CAISO) grid and IID.

The proposed project would allow for excess, intermittent renewable energy to be stored and later dispatched back into the electrical grid as firm, reliable generation. The proposed project supports the Southern California bulk electric system by serving as a transmission asset.

## **1.0 INTRODUCTION**

### **1.1 PROJECT TITLE**

Westside Canal Battery Storage Project (Project, proposed Project)

### **1.2 LEAD AGENCY NAME AND ADDRESS**

County of Imperial  
Planning and Development Services  
801 Main Street  
El Centro, CA 92243-2811

### **1.3 CONTACT PERSON AND PHONE NUMBER**

Dave Black, Planner IV  
Imperial County Planning & Development Services  
801 Main Street  
El Centro, CA 92243  
442-265-1749

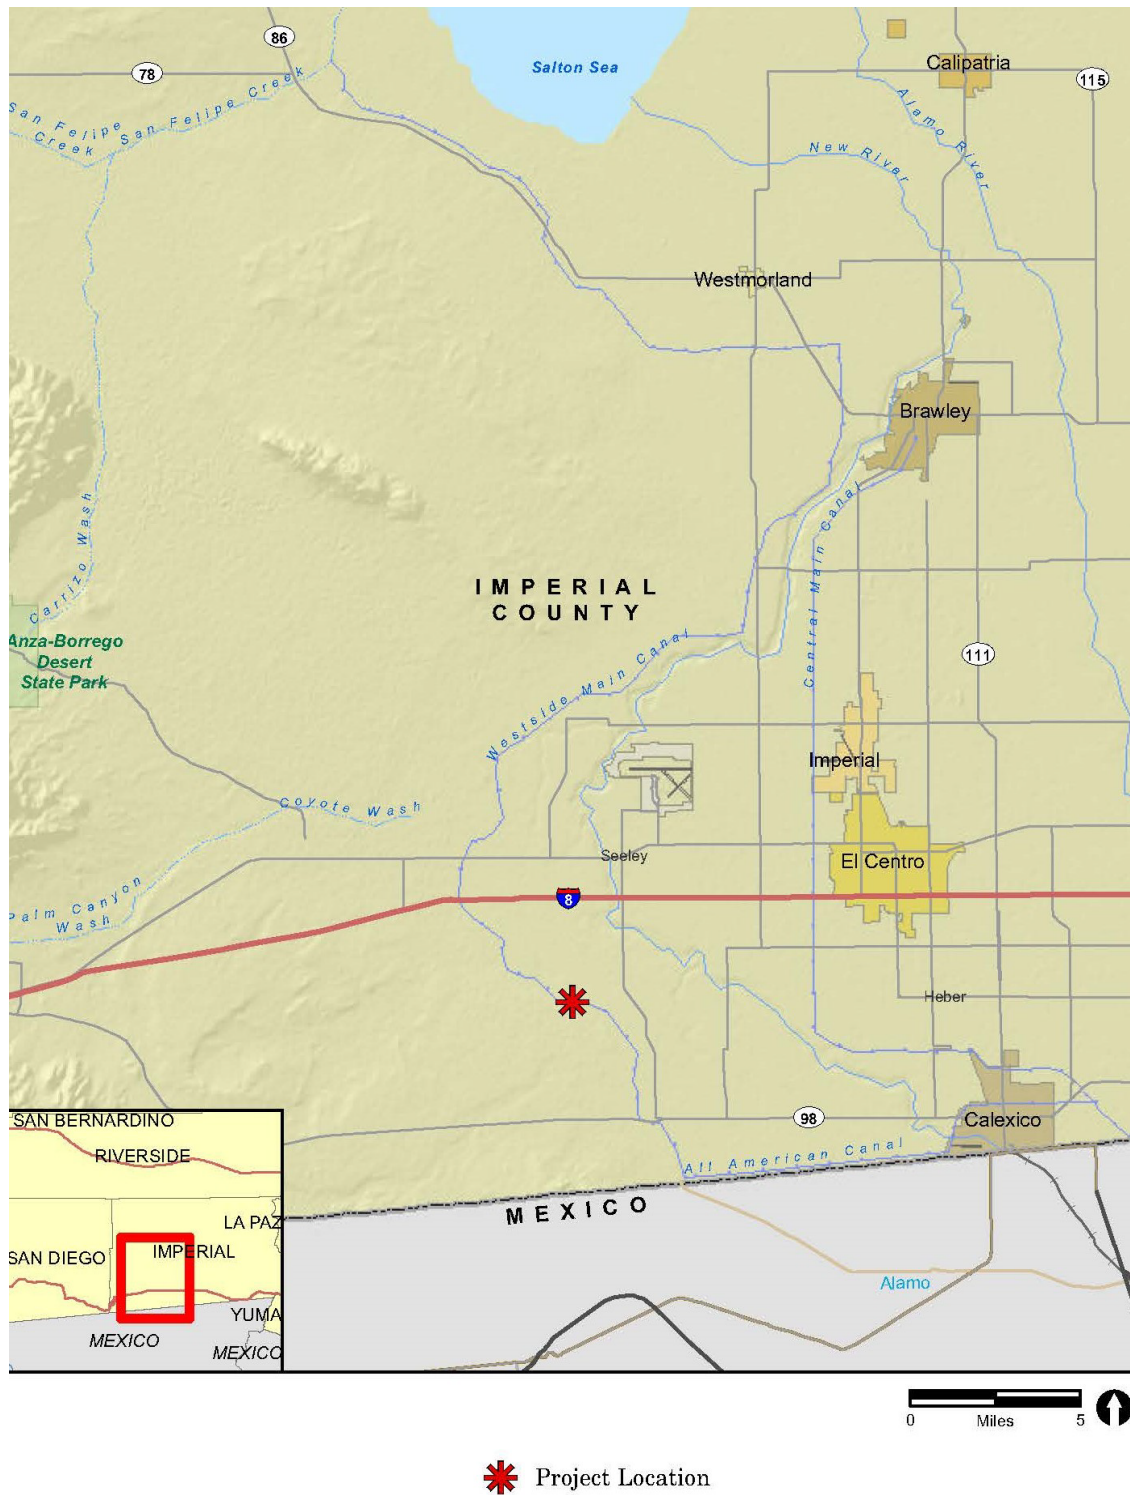

### **1.4 PROJECT LOCATION**

The Project is proposed to be located in the unincorporated Mount Signal area of Imperial County (County), approximately 8.0 miles southwest of the city of El Centro and approximately 5.3 miles north of the U.S.-Mexico border (Figure 1). The Project site is comprised of two parcels, Assessor Parcel Number (APN) 051-350-010 and APN 051-350-011, totaling approximately 148 acres. These parcels have limited access corridors for vehicular traffic and are considered less desirable for agricultural production, as reflected by the last 15 years in which no farming activities have occurred, as indicated on the Project Site Aerial (Figure 2).

The Project site is located approximately one-third mile north of the Imperial Valley Substation (IV Substation) and directly south of the intersection of Liebert Road and the Imperial Irrigation District's (IID) Westside Main Canal (the Canal). The Project site is bounded by the Canal to the north, Bureau of Land Management (BLM) lands to the south and west, and vacant private land to the east. The Campo Verde solar generation facility is located north of the Project site, across the Canal. The two Project parcels will be developed as a utility-scale energy storage complex. The Project will utilize portions of two parcels located north of the Canal (APN 051-350-019 owned by IID and APN 051-350-018 owned by a private landowner) for site access and as a temporary construction staging area. The Project will also access a small portion of APN 051-350-009 within an IID easement for connection to the existing IID Campo Verde Imperial Valley 230 kilovolt (kV) radial gen-tie line during the construction of a substation on the Project site. The total proposed Project development footprint, encompassing both temporary and permanent impacts, will be 163.32 acres.

## 1.6 GENERAL PLAN DESIGNATION AND ZONING

**Table 1: General Plan Land Use Designations and Zoning**

Relationship to Project Site	APN	Existing Land Description	General Plan Land Use Designation	Zone
Southwest	051-350-009	Agricultural	Recreational	A-3
Project Site	051-350-010	Agricultural	Agricultural	A-3
Project Site	051-350-011	Agricultural	Agricultural	A-3
North	051-350-018	Agricultural	Agricultural	A-3
North	051-350-019	Agricultural	Agricultural	A-3

## 1.7 PURPOSE AND INTENDED USE OF THE PROJECT

Development of the Westside Canal Battery Storage Project (Project) will provide a utility-scale energy storage complex incorporating lithium-ion battery systems and/or flow battery technologies throughout the site. The Project will allow excess, intermittent renewable energy to be stored and later dispatched optimally back into the existing electrical grid as firm, reliable generation when needed. The Project would complement currently operating clean energy solar and wind projects, as well as those planned for development, in the County and supports the broader Southern California bulk electric system by serving as a transmission asset.

## 1.8 OTHER PUBLIC AGENCIES WHOSE APPROVAL IS REQUIRED

### 1.8.1 Intended Uses of the Initial Study and Permit Requirements

This Initial Study (IS) is an informational document intended to inform the lead agency, other responsible or interested agencies, and the general public of potential environmental effects of the proposed Project. The environmental review process has been established to enable public agencies to evaluate potential environmental consequences and to examine and implement methods of eliminating or reducing any potentially significant adverse impacts. This document is intended to aid the County and the Applicant in determining the appropriate California Environmental Quality Act (CEQA) document needed to support

agency discretionary approvals, permits, and consultations. These permits, approvals, and consultations are described in Table 2.

## 2.0 PROJECT DESCRIPTION

The Applicant is proposing to develop the Westside Canal Battery Storage Project (proposed Project, Project) which would provide a utility-scale energy storage complex with solar panels, lithium-ion battery systems, and/or flow battery technologies distributed throughout the site. The Project would allow for excess, intermittent renewable energy to be stored and later dispatched optimally back into the electric grid as firm, reliable generation. The Project complements both the existing operational renewable energy facilities, and those planned for development, in the County and supports the broader Southern California bulk electric system by serving as a transmission asset.

## 2.1 PROJECT OBJECTIVES

The Project is pursuing the following objectives:

- To allow for the storage of power/renewable power to help meet the state energy needs.
- To be able to receive renewable generated electricity during times of excess generation or times of less desirable generation and store that power for future release when the customer (i.e., a load-serving entity) deems it to be more valuable.
- To be a valuable tool in allowing the customer and system operators to manage and convert intermittent renewable generation into reliable, dispatchable generation upon demand.
- To utilize available land that is in a less desirable location for agricultural production, due to over 15 years of agricultural inactivity, but also due to limited access corridors for vehicular traffic to the remote property.

## 2.2 PROJECT LOCATION AND SITE DESCRIPTION

The Project is proposed to be located in the unincorporated Mount Signal area of the County, approximately 8.0 miles southwest of the City of El Centro and approximately 5.3 miles north of the U.S.- Mexico border.

### 2.2.1 Current Site Conditions

The Project site is comprised of two parcels, Assessor Parcel Number (APN) 051-350-010 and APN 051-350-011, totaling approximately 148 acres. This land has limited access corridors for vehicular traffic and was historically used for agricultural production but has not been farmed for the last 15 years. The Project would also utilize portions of two parcels, totaling approximately 15 acres, located north of IID's Canal (APN 051-350-019 owned by IID and APN 051-350-018 owned by a private landowner) for site access and as a temporary construction staging area. The Project would also access a small portion of APN 051-350-009 within an IID easement, for connection to the existing IID Campo Verde Imperial Valley 230 kV radial gentie line during the construction of a substation on the Project site. The total proposed Project development footprint, encompassing both temporary and permanent impacts, would be approximately 163 acres.

### 2.2.2 Surrounding Land Uses

The Project site is approximately one-third mile north of the IV Substation and directly south of the intersection of Liebert Road and the Canal. The Project site is bounded by the Canal to the north, BLM lands to the south and west, and vacant private land to the east. The Campo Verde solar generation facility is located north of the Project site, across the Canal. Figure 2 shows an aerial photograph of the Project site and the above-mentioned nearby facilities.

The General Plan land use designation and zoning for the Project site and all surrounding parcels to the north and southwest is Agriculture and Recreational. County of Imperial's General Plan land use designation and zoning does not apply to BLM lands that surround the Project site to the west. The Campo Verde solar generation facility is located north of the Project site and agricultural uses are located northeast of the Project site. Parcels farther north of the Project site also include a mix of agricultural uses and solar generation facilities. The parcel immediately east of the Project site is undeveloped. BLM land south and west of the Project site is generally undeveloped, relatively flat, and barren. The IV Substation is located approximately one-third mile south of the southern property line of the site.

## **2.3 PROJECT COMPONENTS**

The Project is expected to be constructed in 3-5 phase over a 10-year period, with each phase ranging from approximately 25 megawatts (MW) up to 400 MW per phase. Construction of the first phase includes roads, bridge and common facilities, and the first battery storage facility and, if approved, is anticipated to begin in 2021 with completion expected in 2022. Subsequent phases would then be completed as demand/market conditions require. Phase I of the Project would store energy for up to a 12-hour duration based on grid and market conditions. The total nameplate (or rated capacity) capacity of the Project at full build-out (all phases completed) is approximately 2,000 MW.

On-site photovoltaic (PV) solar generation would serve as station auxiliary power and be deployed throughout the Project site as both rooftop solar on buildings, as well as ground-mounted solar, constructed during each phase of the Project. Figure 3 shows the conceptual site plan for the Project with a representation of the various energy storage technologies, ground and roof-mounted solar, common facilities within the Project site, and vehicular access and bridge outside the Project site.

### **2.3.1 Phasing**

The timing and energy storage capacity of the Project's phases would be dependent on commercial contracts for the energy/capacity to be stored/discharged in response to the need for energy storage to manage renewable energy growth throughout the greater southern California area. This energy storage complex would thus become a valuable tool for commercial customer(s) and system operators to better manage intermittent renewable generation by converting it into reliable, dispatchable generation. The date for Project build-out is currently not known and would be dependent on the factors listed above. It is anticipated that each phase would be constructed within 1 to 2 years of each other.

### **2.3.2 Common Components**

The Project would consist of multiple phases of development, construction, and operation of an energy storage facility. Although the Applicant plans to build the energy storage components over time and in multiple phases, the first phase of Project construction would include the majority of required construction activities. The first phase would include construction of the Operating and Maintenance (O&M) facilities, water connections and fire suppression systems for the Project, storm water retention, substation, and legal permanent vehicle access, as well as the first energy storage facility. As per the site plan (see Figure 2), the northwest area of the Project serves as the location for the common facilities, which include

substation(s) and the O&M building. With the Project being built in phases, the necessary infrastructure, such as water-mains, retention ponds and access roads, would be built out to serve the Project phases from west to east and expanded over time to serve each phase.

A summary of the common facilities is presented below:

- 230 kV loop-in substation
  - Connection to Campo Verde Imperial Valley 230 kV radial transmission line
  - Located on Applicant property
- Project substation
- O&M building
- Project parking
- Storm water detention basins
- Fencing and Gates

Large industrial buildings, warehouses, engineered containers, and/or electrolyte storage tanks would be the primary structures needed to house the main Project components. Other components to be located on the Project site and adjacent to the proposed buildings/warehouses include some of the following:

- Inverters, transformers, power distribution panels
- Underground water-main loop for Project operation and fire prevention
- Underground wiring to connect to Project substation
- Project site access roads (unpaved/crushed rock)
- Fire water storage tanks
- Aboveground water storage tanks
- Heating, Ventilation, and Air Conditioning (HVAC) units
- Ground-mounted or roof-mounted PV arrays
- Energy Storage sites
- Emergency backup generator(s)

### **2.3.2.1 Operations and Maintenance Facilities**

The O&M building described in Phase 1 above is expected to be the only manned facility on the site and would include up to approximately 20 full-time employees working in three shifts during a 24-hour period. No offices or staffed control centers would be located within the storage-specific warehouses/buildings. For sanitary waste, the Project would include a septic leach field to be located near the O&M building. The proposed O&M building would also require an HVAC unit.

### **2.3.2.2 Water Connections**

During construction the Project would utilize at least two temporary connections to the Canal for dust suppression and other construction uses such as concrete production. Permanent water to serve the Project's water and fire suppression needs would come from the Canal. Water infrastructure for the water/fire suppression would be laid underground throughout the site by open trenching. A segment of line from the Project boundary to the connection at the Canal would be constructed by a horizontal directional drilled underground bore to clear the existing IID Canal O&M road. It is anticipated that approximately 210 acre-feet (AF) of water would be required for the full buildout/construction of the site, over the projected 10-year construction time frame.

Following construction, service water would be supplied either by an on-site water treatment system (package plant) drawing water from the Canal or from deliveries from water suppliers via the Canal connection. This service water would be used for operations using on-site aboveground storage. Water usage for the O&M building and personnel would be less than 10,000 gallons per day (gpd). Additionally, approximately 1,000,000 gallons of water would be stored on site in storage tanks for fire suppression.

The Project would connect to the Canal via an underground horizontal directional drilling (HDD). Once drilling commences, drilling would extend into the side of the Canal underwater. A water pipe (size to be decided once final engineering design is complete) will be installed through the drill hole and into the Canal. The Applicant understands that IID prefers an underground bore versus open excavation watermain trenching to IID canals.

### **2.3.2.3 Stormwater Retention**

As part of the proposed Project, stormwater retention basins would be constructed at designated locations throughout the site, based upon the hydrology analysis, to channel and manage stormwater flows. The retention basins would be sized in accordance with the County's design guidelines. Based upon these design guidelines, the basins will be able to retain at least 3 inches of rainfall across the entire site. The current basin design has a maximum depth of 5 feet with 4:1 side slopes and provides a retention volume of approximately 40.8 AF. The basins will be excavated out of and constructed using native soil. Retention basins may be added with each phase, such that the site might have different drainage areas contributing to each basin.

### **2.3.2.4 Permanent Vehicle Access**

There are no circulation element roadways in the immediate vicinity of the Project site. The nearest freeways are Interstate 8 (I-8), located 4.6 miles north of the Project site, and State Route 98 (SR-98), located 5.2 miles south of the Project site. Drew Road, a 2-lane collector, is located 1.3 miles east of the Project site. All other roadways in the immediate vicinity of the Project site are rural roadways. All roadways that would be used to access the Project site from I-8 are currently paved, except for the portion of Liebert Road south of Wixom Road. However, this segment would be paved prior to Project operation.

### **Public Access Roads**

Prior to any construction on the main Project site (Phase I), vehicular access for the Project would need to be established. The proposed Project site is surrounded by private landowners to the east, BLM land to the south and west, and IID maintenance roads and the Canal to the north. Due to the property having no current (or legal) direct vehicular access routes, the Applicant is proposing to construct public access roads on both the north and south side of the canal on private land and a permanent clear-span bridge over the Canal (Figure 4 and 5). The proposed new public access roads would be designed and constructed in accordance with County standards. In addition, the Project would dedicate 60 feet of frontage along the north Project fence line and south of the IID maintenance road to be used for both employee access to the site as well as limited public access (i.e., adjacent neighboring landowners).

## **Clear-Span Bridge**

The permanent new clear-span County/California Department of Transportation (Caltrans) specified bridge would span the Canal to connect to a proposed access road easement on the north side of the Canal. The north proposed access road would ultimately connect the Project to Liebert Road.

Construction of the permanent clear-span bridge spanning the IID's Westside Main Canal requires CED to have access to both the north side and the south of the Canal to perform the necessary construction activities. In addition to being necessary to facilitate construction of the new permanent clear-span bridge, access from the south side of the Westside Main Canal would allow CED to commence construction on the initial phase (Phase I) of the Project simultaneously, thereby shortening the duration of construction and potentially minimizing the associated impacts. CED is evaluating various options for temporary construction access, including accessing the Project site from the south side of the Canal off SR-98, as well as options involving access from the north side of the Canal from I-8. The preferred temporary access option would be used until construction of the permanent bridge is completed.

### **2.3.2.5 Substation Components**

The proposed Project substation is a central hub for the 34.5 kV collector circuits from the energy storage components and step-ups the electricity voltage from 34.5 kV to 230 kV. The substation site is comprised of approximately 10 acres and includes, but is not limited to, the following major components:

1. 34.5 kV bus and associated switching devices
2. 230 kV bus and associated switching devices
3. 34.5/230 kV transformers
4. 34.5 kV capacitors, as needed
5. Tubular steel support structures
6. Circuit Breakers
7. Grounding grid
8. Prefabricated modular control building to house Supervisory Control and Data Acquisition (SCADA) (unoccupied except during inspection and maintenance)

The substation will be constructed as part of the Phase I of the Project. Sequencing is proposed as follows:

The entire 10-acre site will be graded:

- Install concrete foundations
- Install grounding grid
- Install steel support structures
- Install bus, switching devices, capacitors
- Install control building
- Install fencing
- Install transformer

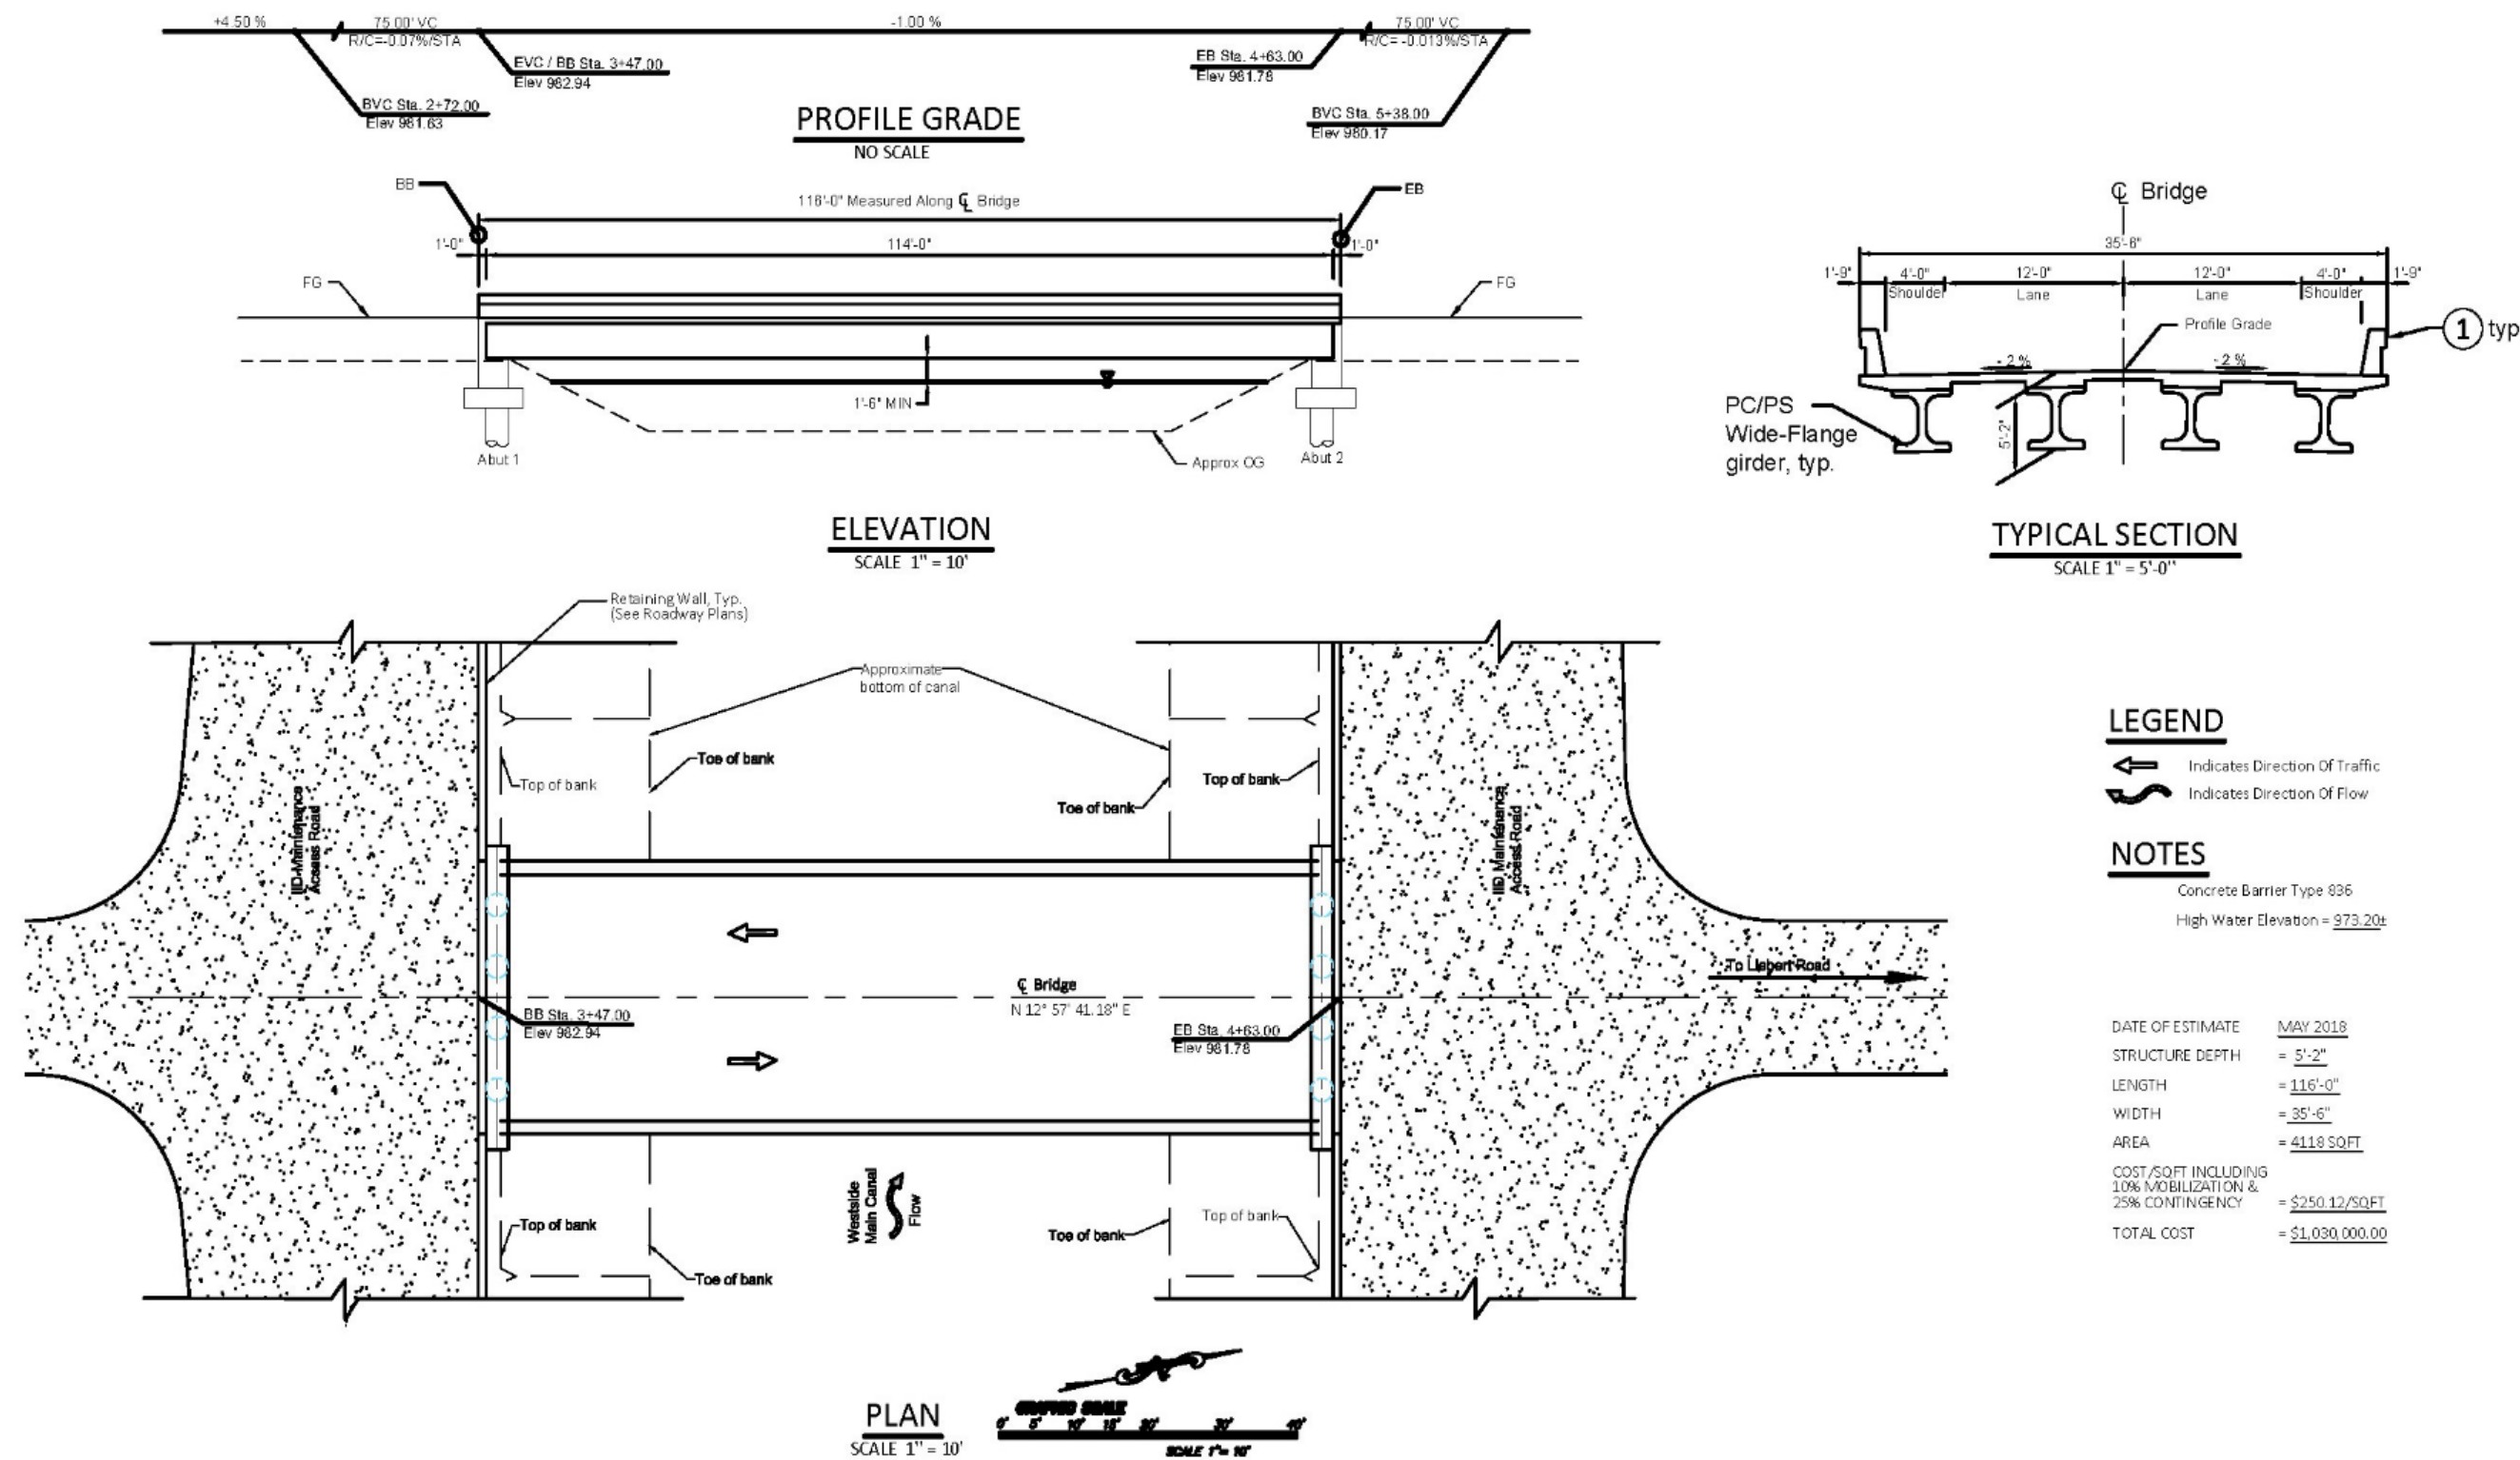

Figure 4. Westside Main Canal Bridge Site Plan

Prepared by County of Imperial Public Works Department.

Figure 5. Westside Main Canal Bridge Elevation

Prepared by County of Imperial Public Works Department.

Items 2, 4, 5, and 8 (from above) will be constructed in conjunction with each new Project phase. The perimeter fence, ground grid, and grading will be fully completed for the entire Project during Phase I construction. SCADA and Alternating Current (AC) collection circuits will be constructed per their corresponding phase. The transformers will contain mineral oil or natural esters oil and would not contain Sulfur hexafluoride (SF<sub>6</sub>). The substation would be an open-air substation (not gas insulated).

#### **2.3.2.6 Construction**

The Project would include the construction of a substation located at the western Project boundary. The substation would include equipment such as switches, circuit breakers, and transformers.

#### **2.3.2.7 Fire Protection/Fire Suppression**

Fire protection systems for battery systems will be designed in accordance with California Fire Code 2016 and will take into consideration the recommendations of the National Fire Protection Association (NFPA) 855, Standard for the Installation of Stationary Energy Storage Systems. Depending on the technology used in a phase, fire suppression agents such as Novec 1230 or FM 200, or water may be used as a suppressant. In addition, fire prevention methods will be implemented to reduce potential fire risk, including voltage, current and temperature alarms. Energy storage equipment will comply with Underwriters Laboratories (UL) standard UL-9540 and will account for the results of UL-9540A. The Project has the potential to utilizing either lithium-ion batteries and/or flow batteries. Flow batteries are generally not flammable and do not require fire suppression systems. In locations where equipment is located within buildings, automated fire sprinkler systems will be designed in accordance with California Fire Code. A fire loop system and fire hydrants will be located throughout the site for general fire suppression. Buildings and containers for both lithium-ion and flow batteries will be unoccupied enclosures. These buildings will have an automatic sprinkler system designed in accordance with California Fire Code Section 903.

To mitigate potential hazards, redundant separate methods of failure detection will be implemented. These include alarms from the Battery Management System (BMS), including voltage, current, and temperature alarms. Detection methods for off gas detection will be implemented, as applicable. These are in addition to other protective measures such as ventilation, overcurrent protection, battery controls operating batteries within designated parameters, temperature and humidity controls, smoke detection, and maintenance in accordance with manufacturer guidelines. Flow battery tanks would be designed to have secondary containment in the event of a failure. Remote alarms will be installed for operations personnel as well as emergency response teams in addition to exterior hazard lighting. In addition, an Incidence Response Plan will be implemented depending upon the technology installed for each phase.

Additionally, the Project intends to commit to purchase or contribute its proportionate share to purchase, a Type 1 Fire Engine which shall meet all NFPA standards for structural firefighting for the Imperial County Fire Department. The Type 1 Fire Engine would be housed off-site within Fire Station 2, located approximately 12 miles from the Project site.

The fire suppression systems will be designed in accordance with the 2016 California Fire Code or current Fire Code at the time of construction. A fire loop system will be installed around the site with fire hydrants

spaced at 300-foot intervals in accordance with fire flow requirements. The fire loop will be built out and extended to serve each phase as the Project site is developed. Fire water will be obtained by tapping into the Canal and will be stored in tanks (described above) adjacent to the Canal. Multiple tanks will be required to provide the needed fire flow volume, and the tanks will also be installed in phases as the site is developed and eventually built-out. The fire suppression system will consider NFPA 855 standards. Depending on the technology used in a particular phase, fire suppression agents such as Novec 1230 or FM 200 may be used. In addition, fire prevention methods will be implemented to reduce potential fire risk, including voltage, current and temperature alarms. Energy storage equipment will comply with UL-9540 and will account for the results of UL-9540A.

### **2.3.2.8 Supervisory Control and Data Acquisition**

Each station (the substation and switching station) proposed on the site plan would also have fences installed around its perimeter in order to limit and control access.

## **2.3.3 Battery Storage Components**

Once vehicle access to the Project site is established, the first phase of site construction would consist of either a lithium-ion battery storage facility or a flow battery storage facility. This first phase would be dependent on the first commercial contract awarded to the Applicant by a customer. Large industrial buildings, warehouses, and/or containers to house the storage equipment, including battery cells, modules, racks, and controls for lithium-ion technologies, would be needed. For flow battery technologies, cell stack modules, pumps, and controls may be installed inside industrial buildings or pre-engineered outdoor enclosures. Electrolyte storage tanks and associated piping may be located indoors or outdoors, depending on the technology.

### **2.3.3.1 Construction**

Following completion of the access road and bridge over the Canal, the Project would grade the entire Project site and begin construction of the utility-scale energy storage complex. To access the Project site, construction workers would travel along I-8 and head 4.6 miles south to the Project site, utilizing the constructed bridge. During peak construction activities, approximately 200 workers and 30 daily deliveries would be required. Construction activities for the utility-scale energy storage complex would last for up to 32 months.

### **2.3.3.2 Battery Modules Technology**

#### **Flow Battery**

A flow battery is a rechargeable fuel cell in which an electrolyte containing one or more dissolved electroactive elements flows through an electrochemical cell that reversibly converts chemical energy directly to electricity. Additional electrolyte is stored externally, generally in tanks, and is usually pumped through the cell (or cells) of the reactor, although gravity feed systems are also known to be used. Flow batteries can be rapidly "recharged" by replacing the electrolyte liquid while simultaneously recovering the

spent material for re-energization. Many flow batteries use carbon felt electrodes due to its low cost and adequate electrical conductivity.

### **Lithium-Ion Battery**

A lithium-ion battery is also a type of rechargeable battery. In the batteries, lithium ions move from the negative electrode through an electrolyte to the positive electrode during discharge, and back when charging. Lithium-ion batteries use an intercalated lithium compound as the material at the positive electrode and typically graphite at the negative electrode. The batteries have a high energy density, no memory effect and low self-discharge.

### **Energy Storage**

Energy storage is the capture of energy produced at one time for use at a later time. A device that stores energy is generally called an accumulator or battery. Energy comes in multiple forms including radiation, chemical, gravitational potential, electrical potential, electricity, elevated temperature, latent heat and kinetic. Energy storage involves converting energy from forms that are difficult to store to more conveniently or economically storable forms. Energy storage technology may be centralized or may be distributed throughout the plant. Depending on the technology selected for the energy storage component, the substation and transmission lines as well as the solar field inverters and transformers may be active during both daylight and nighttime hours.

#### **2.3.3.3 Backup Generator**

The Project would include an emergency backup generator(s) to supply auxiliary power to the facility during rare events in which the entire facility or portions of the facility are disconnected from the local electrical grid system. The generators would be sized to accommodate control systems and minimal targeted HVAC system loads for equipment protection. The purpose of the generators would be to provide system safety and during the event that neither the transmission interconnection or the on-site solar generation system are available to maintain battery safety and warranty temperature parameters.

These generators may be either installed in a central location near the common facilities or distributed among individual buildings. They may be diesel, natural gas, or propane fueled. The generators would be periodically tested each year to maintain backup capability in the event of a grid emergency. All generators would be subject to Imperial County Air Pollution Control District review and permitting requirements.

Below is a generalized table for emergency generators based on 1 gigawatt (GW) of lithium-ion (Li-Ion) batteries and 1 GW of flow batteries, including their safety and warranty temperature parameters. Size and quantity will scale with the MW proposed in each phase. Detailed design is required to accurately calculate the generator load, which will be included with each design phase and the final battery technology selection.

**Table 3: Approximate Generator Size**

Technology	Project Size (MW)	Backup Gen Size (kW)	Backup Gen Qty.	Total Backup Gen Size (kW)
Li-ion	1,000	1,750	20	35,000
Flow	1,000	4,000	20	20,000
Total	2,000	--	--	55,000

## 2.3.4 Solar Facility Components

### 2.3.4.1 Photovoltaic Cells

Solar photovoltaic cells, also called PV cells, convert sunlight directly into electricity. PV gets its name from the process of converting light (photons) to electricity (voltage), which is called the PV effect. The panels are mounted at a fixed angle facing south, or they can be mounted on a tracking device that follows the sun, allowing them to capture the most sunlight. Many solar panels combined together to create one system is called a solar array. Traditional solar cells are made from silicon, are usually flat-plated, and generally are the most efficient.

Second-generation solar cells are called thin-film solar cells because they are made from amorphous silicon or non-silicon materials such as cadmium telluride (CdTe). Thin film solar cells use layers of semiconductor materials only a few micrometers thick. Because of their flexibility, thin film solar cells can double as rooftop shingles and tiles, building facades, or the glazing for skylights.

Third-generation solar cells are being made from variety of new materials besides silicon, including solar inks using conventional printing press technologies, solar dyes, and conductive plastics. Some new solar cells use plastic lenses or mirrors to concentrate sunlight onto a very small piece of high efficiency PV material. The PV material is more expensive, but because so little is needed, these systems are becoming cost effective for use by utilities and industries. However, because the lenses must be pointed at the sun, the use of concentrating collectors is limited to the sunniest parts of the country.

### 2.3.4.2 On-site Solar Generation

On-site PV solar generation will serve as station auxiliary power and be deployed throughout the Project site as rooftop solar on buildings, as well as ground-mounted solar, constructed during each phase. The solar PV generating component would consist of a 3.2 foot by 6.5-foot PV modules (or panels) on single-axis horizontal trackers in blocks. Each PV module would be constructed out of a poly-crystalline silicon semiconductor material encapsulated in glass, in which the PV effect would allow the electrons to flow through that material to produce electricity. The panels would be oriented from east to west for maximum exposure and the foundation would be designed based on soil conditions. The PV modules are made of a poly-crystalline silicon semiconductor material encapsulated in glass. Installation of the PV arrays would include installation of mounting posts, module rail assemblies, PV modules, inverters, transformers and buried electrical conductors. Concrete would be required for the footings, foundations and pads for the

transformers and substation work. Tracker foundations would be comprised of either driven or vibrated steel posts/pipes and/or concrete in some places (depending on soil and underground conditions).

#### **2.3.4.3 Construction Sequence and Equipment**

Construction activities would be sequenced and conducted in a manner that addresses storm water management and soil conservation. During construction, electrical equipment would be placed in service at the completion of each power-block. The on-site workforce would consist of laborers, electricians, supervisory personnel, support personnel, and construction management personnel.

Construction would generally occur during daylight hours, Monday through Friday. However, non- daylight work hours may be necessary to make up schedule deficiencies or to complete critical construction activities. For example, during hot weather, it may be necessary to start work earlier to avoid pouring concrete during high ambient temperatures. If construction is to occur outside of the County's specified working hours, coordination with the County will occur in advance of these activities.

## **2.4 SITE SECURITY**

An eight-foot-tall fence (e.g., chain-link) topped with barbed wire would be installed around the entire Project site for safety and in order to control access. Each station proposed on the site plan would also have fences installed around its perimeter. A camera-equipped call button would be installed at the front entry gate to the site which would be monitored from the Project's O&M building. Throughout the site at various points, security cameras may be installed to monitor other areas of the Project site. During the construction of each Project phase, the Applicant would have on-site security personnel between dusk and dawn and during hours of non-active construction.

## **2.5 INTERCONNECTION OPTIONS**

The proposed point of interconnection for the Project is the Imperial Valley Substation 230 kV bus. As reflected in the conceptual site plan, to achieve this, the Applicant plans to build a new loop-in substation on the Project site and connect to the existing IID Campo Verde Imperial Valley 230 kV Radial gen-tie line. This gen-tie line ultimately connects about one-third mile south of the Project site into the Imperial Valley Substation, which is ultimately the Project's point of interconnection to the California Independent System Operator (CAISO) grid. The Applicant submitted the necessary Interconnection Request Applications to the CAISO and IID in 2017 and 2018 and approval is pending.

## **2.6 EXISTING AND PROPOSED UTILITY EASEMENTS**

### **Existing Easements**

The site (APNs 051-350-10 and 051-350-011) has three major existing utility easements lying across the site. The first is for overhead collector transmission circuits and utility facilities, as well as access. This is for the IID Campo Verde Imperial Valley 230 kV transmission line easement, which lies inside and along the west property line and runs north/south. The second major easement is a prescriptive easement for an

overhead collector transmission circuit and utility distribution for access to/from the Project site. This easement runs north/south and lies directly in the center of the Project site. The IID transmission line within this prescriptive easement is known as the S-Transmission line (S-Line). The third major easement lies along the north property line. This easement was granted to IID for the purposes of the existing Canal and appropriate infrastructure and operation and maintenance roads for the Canal.

### **Proposed Easement**

The Applicant and IID are in the process of determining the width of this S-Line easement to create a non-exclusive easement. This easement would also include the existing distribution line that lies within the easement. Until this new easement agreement is in place, the Applicant has planned for a 300-foot temporary corridor on the Project site plan (centerline of 300-foot corridor is the S-Line) to allow the IID energy engineering team to design and implement an appropriate new easement. Once the width and location of the new easement is determined, all other areas that are not part of the new S-Line easement lying within the 300-foot corridor would become part of the Project site

## **2.7 PROJECT OPERATION**

Operation of the Project would require routine maintenance and security. It is anticipated that the Project would employ a plant manager and an O&M manager, as well as the addition of a facility manager once the complex deploys 500 MW of generation. The complex would also employ staff technicians, with at least one additional technician for every approximately 250 MW of generation.

Operation of the Project would require up to 20 employees or 2.5 employees working three eight-hour shifts in order to provide 24-hour personnel coverage at the plant. Assuming two one-way trips per employee, the Project would be anticipated to generate up to 40 trips per day from all maintenance and security personnel.

Figure 3 shows the floor plan for each lithium-ion 50 MW building. As shown, each building would include 10 air cooling units (5 on each side of the building) and 20 transformers and inverters (10 on each side of the building). The current site plan includes 20 of these buildings, and more would be constructed during subsequent phases as the market demands.

Depending on the technology selected for the energy storage component, the substation and transmission lines as well as the solar field inverters and transformers may be active during both daylight and nighttime hours.

## **2.8 CONSTRUCTION EQUIPMENT AND WORKFORCE**

Construction would include the use of standard construction equipment such as scrapers, excavators, loaders, and water trucks, and other similar machinery. Construction equipment would be used for site preparation activities such as clearing, grading, perimeter fencing, development of staging areas and site access roads and would involve facility installation activities, including support masts, trenching utility connections, construction of electrical distribution facilities, O&M building, access roads and the clear-span bridge. Delivery trucks also would bring materials to the site. Depending on the specific phasing of the Project and construction schedule, on-site equipment may be used simultaneously or in phases.

Phase 1 of the proposed Project would require grading of the entire site and construction of the utility-scale energy storage complex, which would take approximately 12 months to complete. The remaining phases would be completed in approximately 24 months. During peak construction activities, approximately 200 workers and 30 daily deliveries would be required. Construction staff and equipment will be determined based on the size and design specifications of each phase. The table below shows estimates of the construction staff and equipment that will be needed for each phase. It is anticipated that the common facilities will be constructed simultaneously with the first phase of battery storage in order to bring both online at the same time.

**Table 4: Estimated Construction Staff and Equipment Per Project Phase**

Facility Type	Phase 1		Subsequent Phases 2-5
	Common Facilities	BESS <sup>1</sup>	BESS <sup>1</sup>
Vehicle Type	# of equipment for 8 hours/day		
Air Compressor	1	2	2
Backhoe	2	2	2
Concrete Pump	1	1	1
Crane	3	1	1
Dozer	2	--	--
Drill Rig	1	--	--
Excavator	1	1	1
Forklift	2	2	2
Generator	2	3	3
Grader	2	--	--
Paver	1	--	--
Rollers	3	2	2
Scraper	1	1	1
Water Truck	2	1	1
Wheeled Loader	1	1	1
Wheeled Tractor	1	--	--
Construction Personnel	# of people for 8 hours/day		
Site Superintendent	1	1	1
Construction Manager	1	1	1
Assistant Construction Manager	1	1	1
Safety Manager	1	1	1
Foreman	6	4	2
Field Engineer	3	2	2
Surveyor	2	2	2

Geotechnical Engineer	1	1	1
Heavy equipment operator	19	12	12
Laborer/Installer	90	50	50

<sup>1</sup> BESS = Battery Energy Storage System

## 2.9 SCHEDULE

Depending on the size of the battery system for a given phase, construction and commissioning (approval to operate) is anticipated to take approximately 6 to 12 months. The 100- to 200-MW first phase would require build out of Project facilities, roads, and the proposed clear-span bridge. Subsequent phases will require improvements such as additional substation equipment, water main and site road extension, but will not require construction of additional common facilities.

Construction activities may only occur Monday through Friday, between the hours of 7:00 a.m. and 7:00 p.m. or Saturday between the hours of 9:00 a.m. and 5:00 p.m., excluding holidays, per County Ordinance.

## 2.10 DISCRETIONARY ACTIONS

### 2.10.1 General Plan Amendment and Zone Change

The Project proposes a General Plan Amendment and Zone Change to change the land use designation and zoning for the Project site from Agriculture (A3) to Industrial. The Industrial zoning would be limited to Energy Production/Use.

### 2.10.2 Development Agreement

The Applicant may pursue a Development Agreement with the County of Imperial for this Project.

### 2.10.3 County Solar Overlay Annexation

The Applicant may pursue annexation into the County of Imperial Solar Overlay Plan.

### 2.10.4 Conditional Use Permit (CUP 19-0015)

The Applicant has requested a Conditional Use Permit to allow a utility-scale energy storage complex in an Industrial zone.

### 2.10.5 Water Supply Assessment

The Applicant has requested a Water Supply Assessment, in accordance with SB 610, to identify critical water supply and water quality needs for the proposed Project.

## 3.0 ENVIRONMENTAL SETTING, ANALYSIS, AND MITIGATION MEASURES

### 3.1 INTRODUCTION TO ENVIRONMENTAL ANALYSIS

As defined by Section 15063 of the State CEQA Guidelines and Section 7 of the County's Guidelines for Implementing CEQA, an Initial Study is prepared primarily to provide the Lead Agency with information to use as the basis for determining whether an Environmental Impact Report (EIR), Negative Declaration, or Mitigated Negative Declaration would be appropriate for providing the necessary environmental documentation and clearance for any proposed project.

☒ According to Section 15065, an EIR is deemed appropriate for a particular proposal if the following conditions occur:

- The proposal has the potential to substantially degrade quality of the environment.
- The proposal has the potential to achieve short-term environmental goals to the disadvantage of long-term environmental goals.
- The proposal has possible environmental effects that are individually limited but cumulatively considerable.
- The proposal could cause direct or indirect adverse effects on human beings.

☐ According to Section 15070(a), a Negative Declaration is deemed appropriate if the proposal would not result in any significant effect on the environment.

☐ According to Section 15070(b), a Mitigated Negative Declaration is deemed appropriate if it is determined that though a proposal could result in a significant effect, mitigation measures are available to reduce these significant effects to insignificant levels.

This Initial Study (IS) has determined that the proposed applications will result in potentially significant environmental impacts and therefore, an Environmental Impact Report is deemed as the appropriate document to provide necessary environmental evaluations and clearance for the proposed Project.

This Initial Study and Notice of Preparation are prepared in conformance with the California Environmental Quality Act of 1970, as amended (Public Resources Code, Section 21000 et. seq.); Section 15070 of the State & County of Imperial's Guidelines for Implementation of the California Environmental Quality Act of 1970, as amended (California Code of Regulations, Title 14, Chapter 3, Section 15000, et. seq.); applicable requirements of the County of Imperial; and the regulations, requirements, and procedures of any other responsible public agency or an agency with jurisdiction by law.

Pursuant to the County of Imperial Guidelines for Implementing CEQA, depending on the project scope, the County of Imperial Board of Supervisors, Planning Commission and/or Planning Director is designated

the Lead Agency, in accordance with Section 15050 of the CEQA Guidelines. The Lead Agency is the public agency which has the principal responsibility for approving the necessary environmental clearances and analyses for any project in the County.

### 3.1.1 Intended Uses of Initial Study and Notice of Preparation

This IS and Notice of Preparation (NOP) are informational documents which are intended to inform County decision makers, other responsible or interested agencies, and the general public of potential environmental effects of the proposed applications. The environmental review process has been established to enable public agencies to evaluate environmental consequences and to examine and implement methods of eliminating or reducing any potentially adverse impacts. While CEQA requires that consideration be given to avoiding environmental damage, the Lead Agency and other responsible public agencies must balance adverse environmental effects against other public objectives, including economic and social goals. The IS and NOP prepared for the Project will be circulated for a period of 35 days for public and agency review and comments.

### 3.1.2 Environmental Assessment Methodology

The environmental factors checked below would be potentially affected by this Project, involving at least one impact that requires mitigation to reduce the impact from “Potentially Significant” to “Less than Significant” as indicated by the checklist on the following pages.

- |   |   |  |
|---|---|--|
| <input checked="" type="checkbox"/> Aesthetics                          | <input checked="" type="checkbox"/> Greenhouse Gases                | <input type="checkbox"/> Public Services                               |
| <input checked="" type="checkbox"/> Agricultural and Forestry Resources | <input checked="" type="checkbox"/> Hazards and Hazardous Materials | <input type="checkbox"/> Recreation                                    |
| <input checked="" type="checkbox"/> Air Quality                         | <input checked="" type="checkbox"/> Hydrology and Water Quality     | <input type="checkbox"/> Transportation                                |

| <input type="checkbox"/> Cultural Resources                             | <input type="checkbox"/> Mineral Resources                          | <input checked="" type="checkbox"/> Utilities and Service Systems      |
| <input type="checkbox"/> Energy Resources                               | <input type="checkbox"/> Noise                                      | <input type="checkbox"/> Wildfires                                     |
| <input checked="" type="checkbox"/> Geology and Soils                   | <input type="checkbox"/> Population and Housing                     | <input checked="" type="checkbox"/> Mandatory Findings of Significance |

#### 3.1.2.1 Evaluation of Environmental Impacts

Section 3.0, Environmental Checklist and Environmental Evaluation presents the environmental checklist form found in Appendix G of the CEQA Guidelines. The checklist form is used to describe the impacts of the Project. A discussion follows each environmental issue identified in the checklist. Included in each discussion are project-specific mitigation measures, if needed.

For the checklist, the following designations are used:

**Potentially Significant Impact:** An impact that could be significant and for which mitigation has not been identified. If any potentially significant impacts are identified, an EIR must be prepared. An Initial Study Mitigated Negative Declaration (ISMND) cannot be used if there are potentially significant impacts that cannot be mitigated.

**Less Than Significant with Mitigation Incorporated:** This designation applies when applicable and feasible mitigation measures previously identified in prior applicable EIRs or in the General Plan Environmental Impact Report (General Plan EIR) have reduced an effect from “Potentially Significant Impact” to a “Less Than Significant Impact” and, pursuant to Section 21155.2 of the PRC, those measures are incorporated into the ISMND.

This designation also applies when the incorporation of new project-specific mitigation measures not previously identified in prior applicable EIRs or in the General Plan EIR have reduced an effect from a “Potentially Significant Impact” to a “Less Than Significant Impact”.

**Less Than Significant Impact:** Any impact that would not be considered significant under CEQA, relative to existing standards.

**No Impact:** The proposed Project would not have any impact.

### **3.1.2.2 Important Note to the Reader**

The California Supreme Court in a December 2015 opinion [California Building Industry Association v. Bay Area Air Quality Management District, 62 Cal. 4<sup>th</sup> 369 (No. S 213478)] confirmed that CEQA, with several specific exceptions, is concerned with the impacts of a project on the environment, not the effects the existing environment may have on a project. Therefore, the evaluation of the significance of project impacts under CEQA in the following sections focuses on impacts of the project on the environment, including whether a project may exacerbate existing environmental hazards.

This is consistent with one of the primary objectives of CEQA and this document, which is to provide objective information to decision-makers and the public regarding the proposed project as a whole. The CEQA Guidelines and the courts are clear that a CEQA document (e.g., EIR or IS) can include information of interest even if such information is not an “environmental impact” as defined by CEQA.

## 3.2 AESTHETICS

AESTHETICS Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less than Significant Impact	No Impact
Except as provided in Public Resources Code Section 20199:				
a) Have a substantial adverse effect on a scenic vista?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
c) In non-urbanized areas, would the project substantially degrade the existing visual character or quality of public views of the site and its surroundings. (Public Views are those that are experienced from a publicly accessible vantage point). If the Project is in an urbanized area, the potential of the project to conflict with applicable zoning and other regulations governing scenic quality?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

### 3.2.1 Environmental Setting

The proposed Project site currently consists of undeveloped parcels which were historically used for agricultural purposes. Surrounding uses consist of undeveloped land, agricultural uses, BLM land, solar PV installations and the IV Substation, further south. As the Project site would be developed with new energy facilities, industrial uses, structures, roadways and other new developed features, potential impacts to aesthetics are evaluated below.

### 3.2.2 Environmental Impact Analysis

#### a) Would the project have a substantial adverse effect on a scenic vista?

##### **Finding: Less Than Significant Impact**

Scenic vistas generally include extensive panoramic views of natural features, unusual terrain, or unique urban or historic features, for which the field of view can be wide and extend into the distance, and focal views that focus on a particular object, scene or feature of interest. Panoramic views across the Project site include generally unobstructed views of agricultural and undeveloped areas surrounding the Project site. To the north is the Campo Verde solar generation facility and a construction staging area. To the west, BLM land is barren, undeveloped and relatively flat, with distant views of the Jacumba Wilderness Area and hills in the far distance. To the east are undeveloped and agricultural areas, and to the south is undeveloped land with the IV Substation further south.

The proposed Project site is characterized by open vistas and largely unobstructed views. While the Project proposes to construct buildings, warehouses, and other structures; however, there are extremely limited opportunities for the public to enjoy views of the Project site from any direction. There are no major public circulation roadways in the Project area, as the Project site is located in an area which is primarily accessible only by rural roadways. The nearest paved road is Drew Road, located approximately 1.3 miles east of the Project site.

Project components and structures may be visible from a distance along roadways in the vicinity; however, due to the lack of opportunities for the public to enjoy scenic vistas across the Project site, this impact would be less than significant and does not require further evaluation in the EIR.

**b) Would the project substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?**

**Finding: Less Than Significant Impact**

The State Scenic Highway Program, which is administered by the California Department of Transportation (Caltrans), identifies designated scenic highways across the state. The Project is not located within a state- or city-designated scenic highway, and there are no trees, rock outcroppings or historic buildings on the Project site. The closest highway which is considered as eligible for designation as a State Scenic Highway in the County is SR-111, in the vicinity of the Salton Sea by Bombay Beach, which is over 70 miles to the northeast of the Project site (Caltrans 2020). The County does not identify any officially designated scenic roadways; however, the County Circulation and Scenic Highways Element identifies four areas which have the potential to be considered eligible for designation as a state-designated scenic highway (Imperial 2008a). One of these areas is SR-111 by Bombay Beach along the Salton Sea, as described above. Another identified area is I-8 at its intersection with SR-98, by Ocatillo, which is approximately 25 miles west of the Project site. The other two areas are even farther away from the Project site. Due to the distance of the Project site from any state- or county-designated or eligible scenic highways, the Project site would not be visible. Therefore, there would be less than significant impact to scenic resources due to Project implementation, and no further analysis is required in the EIR.

**c) In non-urbanized areas, would the project substantially degrade the existing visual character or quality of public views of the site and its surroundings (Public views are those that are experienced from a publicly accessible vantage point)? If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?**

**Finding: Potentially Significant Impact**

The Project is located in a non-urbanized area, and Project implementation may potentially impact the existing visual character of the Project site and its surroundings. According to the County Conservation and Open Space Element, the Project site is located in an area where maintenance of visual quality has high value (Imperial 2016). The Project proposes to construct large industrial buildings, warehouses, engineered containers and tanks, solar PV facilities, a permanent clear-span bridge over the Canal, new paved

roadways to provide access to the site, parking areas, and an elevated 230-kilovolt (kV) transmission line. These Project components would be constructed in several phases over a span of 10 years. Routine weed abatement and landscape maintenance would occur as needed.

At this time, detailed plans, building elevations and other details regarding the characteristics of these Project components are not yet available. Therefore, a more detailed evaluation of the Project's potential to degrade the existing rural and undeveloped character of the site is required, and this potentially significant impact will be analyzed further in the EIR.

**d) Would the project create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?**

**Finding: Potentially Significant Impact**

The Project site is currently undeveloped and does not contain any sources of light or glare. Implementation of the proposed Project would introduce new sources of illumination which could adversely affect nighttime views in the Project area. New buildings and warehouses would have lighting, and the Project would include illumination for safety around access points, parking areas and other areas throughout the site. Project components, including solar PV and other metallic features may be considered new sources of glare. In addition, during Project construction and operation, vehicles and trucks travelling to and from the Project site would be considered new sources of illumination due to their headlights, as well as potentially creating new sources of glare. Therefore, an evaluation of the Project's potential to create a new source of substantial light or glare is required, and this potentially significant impact will be analyzed further in the EIR.

### 3.3 AGRICULTURAL AND FORESTRY RESOURCES

AGRICULTURAL AND FORESTRY RESOURCES Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less than Significant Impact	No Impact
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Result in the loss of forest land or conversion of forest land to non-forest use?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

#### 3.3.1 Environmental Setting

Agriculture has been the single most important economic activity of the County throughout the 1900s and is expected to play a major economic role in the foreseeable future. The gross annual value of agricultural production in the County has hovered around \$1 billion for the last several years, making it the County's largest source of income and employment. The County's agriculture industry is a major producer and supplier of high-quality plant and animal foods and non-food products. According to the Imperial County Agricultural Commissioner (ICAC), in 2016, agriculture contributed a total of \$4.50 billion to the county economy. Vegetable and melon crops were the single largest production category by dollar value (\$1.01 billion), comprising 48.8 percent of the County total. At 22.7 percent, livestock represented the second largest category (\$468.2 million) and consisted mostly of feedlot cattle (\$400.6 million). Field crops ranked third with \$381.2 million and 18.5 percent. Together, these three categories accounted for 89.9 percent of the County's direct farm production values (ICAC 2017).

### 3.3.2 Environmental Impact Analysis

- a) **Would the project Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?**

**Finding: Potentially Significant Impact**

The majority of the proposed Project site is comprised of fallow agricultural lands, which have not been actively farmed and nor irrigated for over 15 years. The proposed Project site is landlocked but would be developed adjacent to other agricultural uses. Much of the land base in the vicinity of the Project area is considered productive farmland where irrigation water is available. Farming operations in this area generally consist of medium to large-scale crop production with related operational facilities. Crops generally cultivated in the area may include alfalfa, barley, and/or Bermuda grass in any given year. Row and vegetable crops, such as corn, melons and wheat, are also prominent in the area. Land of importance to the local agricultural economy is determined by each County's board of supervisors and a local advisory committee. According to the Important Farmland maps (California DOC 2016a), the Project site contains land which is mapped as Farmland of Local Importance.

A Land Evaluation and Site Assessment (LESA) Analysis was prepared for the Project, by RECON Environmental, Inc., in July 2019. The LESA model is intended to provide a quantitative evaluation of potential impacts to agricultural lands using a point-based evaluation using six different factors which are rated on a 100-point scale (RECON 2019b). A final LESA score between 40 to 59 points is considered significant if both the Land Evaluation (LE) and Site Assessment (SA) scores are greater than or equal to 20 points. Based on the Project specific LESA analysis, the final LESA score is 57.2, with an LE score of 27.2 and a SA score of 30.0. Therefore, the Project is considered to have a potentially significant impact on agricultural resources, and this impact will be analyzed further in the EIR.

- b) **Would the project conflict with existing zoning for agricultural use, or a Williamson Act contract?**

**Finding: Potentially Significant Impact**

The proposed Project site is not located within or adjacent to a Williamson Act contract site (DOC 2016). However, the Project is proposing a General Plan Amendment and Rezone to change the land use designation and zoning for the Project site from Agriculture (A-3) to Industrial, with the Industrial zoning limited to Energy Production/Use. Therefore, although the Project would not conflict with a Williamson Act contract, the Project would conflict with existing zoning for an agricultural use. This potentially significant impact will be analyzed further in the EIR.

- c) **Would the project conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code**

**section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?**

**Finding: No Impact**

The proposed Project site is currently zoned as Agriculture (A-3), and there is no existing zoning designation for forest land, timberland, or timberland production within the proposed Project area. Therefore, there would be no impact to this significant threshold, and no further analysis is required in the EIR.

**d) Would the project result in the loss of forest land or conversion of forest land to non-forest use?**

**Finding: No Impact**

There is no forest land within the proposed Project area. Therefore, there would be no impact to this significant threshold, and no further analysis of is required in the EIR.

**e) Would the project involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?**

**Finding: Potentially Significant Impact**

As discussed above, the Project does not contain any forest land which would be converted to a non-forest use. However, the proposed Project would involve the conversion of farmland to a non-agricultural use. Although, the Project site has had 15-plus years of agricultural inactivity, based on the LESA evaluation, the impact to agricultural resources is considered significant. Therefore, a more detailed evaluation of the Project's potential to impact the conversion of Farmland to non-agricultural use is required, and this potentially significant will be further analyzed in the EIR.

### 3.4 AIR QUALITY

AIR QUALITY Would the Project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less than Significant Impact	No Impact
a) Conflict with or obstruct implementation of the applicable air quality plan?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Result in a cumulatively considerable net increase of any criteria pollutant for which the Project region is non-attainment under an applicable federal or state ambient air quality standard?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Expose sensitive receptors to substantial pollutant concentrations?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

#### 3.4.1 Environmental Setting

Imperial County Air Pollution Control District (APCD) maintains five air quality monitoring stations located throughout the County. Air pollutant concentrations and meteorological information are continuously recorded at these stations and transmitted back to the APCD. The nearest active APCD monitoring station to the proposed Project is the El Centro Monitoring Station located approximately 9.6 miles northeast of the proposed Project site. The El Centro Monitoring Station measures ozone (O<sub>3</sub>), Nitrogen dioxide (NO<sub>2</sub>), and Particulate matter less than 10 and 2.5 micrometers (PM<sub>10</sub> and PM<sub>2.5</sub>).

#### 3.4.2 Environmental Impact Analysis

##### a) Would the project conflict with or obstruct implementation of the applicable air quality plan?

##### **Finding: Potentially Significant Impact**

The proposed Project would generate emissions primarily during the construction of the proposed Project. The Imperial APCD is the Air District responsible for the Project area. Some of the applicable air quality plans include the 2009 State Implementation Plan for Particulate Matter Less than 10 Microns in Aerodynamic Diameter, the 2013 State Implementation Plan for the 2006 24-Hour PM<sub>2.5</sub> Moderate Non-Attainment Area, and the 2017 State Implementation Plan for the 2008 8-hour Ozone Standard.

The construction of these facilities has the potential to cause significant environmental effects through conflict or obstruction of the applicable air quality plans. Therefore, these impacts will be analyzed further in the EIR.

- b) Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the Project region is non-attainment under an applicable Federal or State ambient air quality standard?**

**Finding: Potentially Significant Impact**

The proposed Project site is located in a non-attainment area for National Ambient Air Quality Standards (NAAQS) and California Ambient Air Quality Standards (CAAQS) for O<sub>3</sub> and PM. The majority of PM<sub>10</sub> and PM<sub>2.5</sub> in the region is generated by windblown dust, vehicle traffic across unpaved roads, and other off-highway vehicle usage. The proposed Project has the potential to increase windblown dust and vehicle traffic during construction. Therefore, the construction of these facilities has the potential to cause significant environmental effects through a potential cumulatively considerable net increase of particulate matter during construction. Therefore, this potentially significant impact will be further analyzed in the EIR.

- c) Would the project expose sensitive receptors to substantial pollutant concentrations?**

**Finding: Potentially Significant Impact**

While there are no sensitive receptors are located in the vicinity of the proposed Project, there is the low potential for pollutants to become mobilized due to thermal runaway events, as detailed below in Section 3.10, Hazards and Hazardous Emissions. While it is unlikely that sensitive receptors could be exposed to substantial pollutant concentrations, due to construction or operation of the proposed Project, there is the potential to cause significant environmental effects if such exposure (via an unforeseen thermal runaway) were to occur. As such, this potentially significant impact will be further analyzed in the EIR.

- d) Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?**

**Finding: Potentially Significant Impact**

While there is not a substantial number of people located in the vicinity of the proposed Project, there is the low potential for other emissions to become mobilized due to thermal runaway events, as detailed below in Section 3.10, Hazards and Hazardous Emissions. While it is unlikely that substantial numbers of people could be exposed to other emissions (such as odors) due to construction or operation of the proposed Project, there is the potential to cause significant environmental effects if such exposure (via an unforeseen thermal runaway) were to occur. Therefore, these potentially significant impacts will be further analyzed in the EIR.

### 3.5 BIOLOGICAL RESOURCES

BIOLOGICAL RESOURCES Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less than Significant Impact	No Impact
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or regulated by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

#### 3.5.1 Environmental Setting

As part of the pre-application materials prepared by the Applicant, a Biological Resources Technical Report (BRTR) was prepared for the proposed Project footprint by Recon Environmental, Inc., on July 19, 2019. This BRTR used biological resource data obtained from a combination of literature review, a general biological survey, and focused biological surveys. Focused surveys were conducted for burrowing owl (*Athene cunicularia*), jurisdictional waters/wetlands, and rare plants.

According to the BRTR, focused burrowing owl and rare plant surveys were conducted at appropriate times of the year to detect presence/absence of target species, and the combined biological surveys covered all four seasons (RECON 2019a). Therefore, the likelihood of detection of migrants and seasonal visitors was high. Surveys were limited by temporal factors, as all surveys were conducted during the day or dusk. As a result, some nocturnal animals were observed directly as dusk turned to night following burrowing owl

surveys, and others were detected by signs such as tracks, scat, and/or burrows; however, a full suite of nocturnal animals would have required full night-time surveys or trapping.

Routine weed abatement and landscape maintenance would occur as needed. The Project site is bounded by roads, agricultural uses, and solar generation facilities. As the Project is not adjacent to natural lands, landscaping maintenance for maintaining a fire-clearing zone would be minimal and would result in less than measurable emissions.

### 3.5.2 Environmental Impact Analysis

- a) Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive or special status species in local or regional plans, policies, or regulations, or regulated by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?**

#### **Finding: Potentially Significant Impact**

The proposed Project site has the potential to support native habitats and/or sensitive species. Burrowing owls and burrows are commonly found along canals and drains. The Westside Main Canal is located within the Project site. Flat-tailed horned lizard, Loggerhead shrike, Black-tailed gnatcatcher, Abert's towhee, American badger, Colorado Desert fringe-toed lizard, and Yuma hispid cotton rat may also have the potential to occur on the Project site.

Additionally, the proposed Project site appears to have the potential to support rare or sensitive plant species including Utah vine milkweed (*Funastrum utahense*), mud nama (*Nama stenocarpa*), or California satintail (*Imperata brevifolia*). Additionally, the site appears to support sensitive communities including arrow weed thickets, quailbush scrub, common reed marshes, cattail marsh, and tamarisk thickets.

As such, a potentially significant impact is identified for this issue area. In addition, routine weed abatement and landscape maintenance would occur as needed. A biological resources technical study that will address the proposed Project's potential impacts on biological resources will be prepared and will be further analyzed in the EIR.

- b) Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, and regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?**

#### **Finding: Potentially Significant Impact**

The proposed Project, and the general surrounding region, has the potential to support rare and sensitive plant species, as well as sensitive natural communities. These rare and sensitive species could potentially include Utah vine milkweed (*Funastrum utahense*), mud nama (*Nama stenocarpa*), or California satintail (*Imperata brevifolia*). Additionally, the site appears to support sensitive communities including arrow weed thickets, quailbush scrub, common reed marshes, cattail marsh, and tamarisk thickets.

Therefore, a potentially significant impact is identified for this issue area. A biological resources technical study that will address the proposed Project's potential impacts on biological resources will be prepared and will be further analyzed in the EIR.

- c) Would the project have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?**

**Finding: Potentially Significant Impact**

The Project site contains areas of hydrophytic vegetation and contains potentially jurisdictional wetlands and non-wetland waters of the United States. Thus, a potentially significant impact is identified for this area. A jurisdictional delineation that will address the proposed Project's potential impacts on biological resources will be prepared, and this issue will be further analyzed in the EIR.

- d) Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?**

**Finding: Potentially Significant Impact**

Refer to Response 3.5.2 a). above. This impact is considered potentially significant and will be analyzed further in the EIR.

- e) Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?**

**Finding: Potentially Significant Impact**

Refer to Response 3.5.2 a). above. This impact is considered potentially significant and will be analyzed further in the EIR.

- f) Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?**

**Finding: Potentially Significant Impact**

Refer to Response 3.5.2 a). above. This impact is considered potentially significant and will be analyzed further in the EIR.

### 3.6 CULTURAL RESOURCES

<b>CULTURAL and TRIBAL RESOURCES</b> <b>Would the project:</b>	<b>Potentially Significant Impact</b>	<b>Less Than Significant with Mitigation Incorporation</b>	<b>Less than Significant Impact</b>	<b>No Impact</b>
a) Cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Disturb any human remains, including those interred outside of formal cemeteries?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

#### 3.6.1 Environmental Setting

The County is rich in cultural resources. Archaeological work in the County can be separated into two distinct sections: prehistoric and historic. All prehistoric archaeology deals with aboriginal culture and systems which existed prior to Spanish colonization in 1769. Historical archaeology deals with uncovering facts that no known historical documentation has provided. Thousands of prehistoric (aboriginal culture and systems existing prior to 1769) and hundreds of historic (uncovered facts containing no known historical documentation) are found throughout the County. Prehistoric evidence in the form of trails, rock art, geoglyphs, fish traps, and resource procurement and manufacturing locations are found in the regions surrounding the fertile valley portion of the County. From a historical standpoint, the intensive use of Imperial Valley for irrigation agriculture since the beginning of this century has impacted any resources that may have existed on land that is now farmland or under the Salton Sea. Historic resource sites date back to 1540, when the Hernando de Alcaron Expedition discovered Alta California from near the intersection of I-8 and Highway 186. The next major historical event occurred in 1775, when Juan Bautista de Anza first passed through the area. The Anza Trail itself constitutes a significant cultural resource in the Yuha Desert, as does the later Sonoran/Southern Emigrant Trail which served as a major route to and from coastal California from 1825 to 1865. Although very few structures or artifacts may remain from the use of these trails, the routes themselves are of historical significance. Various other structures, such as missions (Spanish period 1769-1821) and a fort (Mexican period 1821-1848) are still evident in regions throughout the County.

RECON Environmental, Inc., prepared a Cultural Resource Survey on July 18, 2019 for the proposed Project. The purpose of their study was to determine the potential effects of the Project on significant cultural resources (RECON 2019b). For this effort, a records search and an archaeological resources survey were conducted. The records search was requested from the California Historical Resources Information System, South Coastal Information Center at San Diego State University (SCIC). The files at SCIC showed three cultural resources mapped within or adjacent to the proposed Project site. The on-foot archaeological resources survey was conducted between September 14 through 16, 2018, and a second site visit was completed, on February 4, 2019. The records search obtained from the SCIC identified 116 cultural resources within a one-mile radius of the Project site. Three of these resources were mapped within or adjacent to the current Project site. The following were found on-site: lithic and ceramic scatter, a section

of the Canal, and the Fern Check Dam. The latter two are segments of the Canal and drain system. A small temporary camp in 1979 consisted of ceramic sherds and lithics. The site was expanded in 2012 to include two deposits consisting of 18 calcined bones. A west north west-trending dirt segment of the Canal intersects the northern segment of the Project property.

The Canal is approximately 80 feet wide. It is banked by earthen levees of vegetation and is unlined. Dirt access roads run along the levees on both sides of the Canal for maintenance and dredging access. Smaller interior Canal sections occur within the Project site, which delivered water to crops. The Fern Check Dam, a circa 1947 concrete and metal check structure that controls and measures the flow of water in the Canal entering the Fern Side Main Heading and into the Fern Side Main, runs parallel to the Canal. No historic addresses are listed on, adjacent to, or within one mile of the Project site. Forty-five reports have been recorded at the SCIC occurring within one mile of the Project site. Seven of these occur within portions of the Project site. A letter was sent to the Native American Heritage Commission (NAHC) in Sacramento on August 27, 2018 requesting a search of their Sacred Lands File. The NAHC replied on August 27, 2018, indicating that they had no record of Native American cultural resources in the immediate area of the Project.

### 3.6.2 Environmental Impact Analysis

#### a) Would the project cause a substantial adverse change in the significance of a historical resource as identified in Section 15064.5?

##### **Finding: No Impact**

To be considered historically significant, a resource must meet one of four criteria for listing outlined in the California Register of Historical Resources (CRHR) (CEQA Guidelines 15064.3(a)(3)). In addition to meeting one of the criteria outlined in the CRHR, a resource must retain enough intact and undisturbed deposits to make a meaningful data contribution to regional research issues (CCR Title 14, Chapter 11.5 Section 4852 [c]). Further, based on CEQA Guidelines Section 15064.5(b), substantial adverse change would include physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource is materially impaired. This can occur when a project:

- Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register of Historical Resources, National Register of Historic Resources, a local register or historic resources.
- Demolishes or materially alters in an adverse manner those physical characteristics that account for its identification in an historical resources survey meeting the requirements of PRC § 5024.1 (g), unless the public agency establishes by a preponderance of the evidence that the resource is not historically or culturally significant.

Literature review and subsequent cultural resources pedestrian survey of the portion of the study area located within the Project site indicates that twelve previously unrecorded archaeological resources were

identified during the survey. The cultural resources consist of three prehistoric sites and nine prehistoric isolates. It was determined that these newly recorded prehistoric sites and isolates do not meet any of the criteria for listing on the California Register of Historic Places. Therefore, no significant historical resources sites have been identified within the Project study area as such, no impact is anticipated.

In addition, a section of the Canal is eligible for the National Register of Historic Places (NRHP) and CRHR on the local and state levels under Criterion A/1 for its significance in association with development of the Imperial Valley. This resource would be impacted by the construction of a proposed bridge. However, the proposed bridge will not affect the qualities or values that qualify the resource for listing in the NRHP or CRHR and would not result in a significant impact under CEQA. Therefore, the Project would have no impact to the significance of a historical resource as identified in Section 15064.5, and no further analysis is required in the EIR.

**b) Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?**

**Finding: No Impact**

A substantial adverse change is defined as the physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of a historical resource would be materially impaired. Avoidance of the historic property/historical resource through project redesign is the preferred mitigation measure. If redesign is not feasible, minimizing impacts by limiting the degree of impacts or reducing the impact through a data recovery excavation and/or construction monitoring are mitigation options.

The Project will not result in impacts to historical resources since these resources have been recommended not eligible for listing on the NRHP or the CRHR. The Westside Main Canal is eligible for the NRHP and CRHR would be impacted by the Project due to the construction of a proposed bridge across the canal to provide vehicular access from Liebert Road. The proposed bridge would not result in physically destroying or altering that canal but would result in a visual impact to the Westside Main Canal. Because there are other visual impacts along the Westside Main Canal including other bridges and impacts from maintenance improvements such as dredging and concrete lining, the proposed bridge will not affect the qualities or values that qualify the resource for listing in the NRHP or CRHR and would not result in a significant impact under CEQA. Therefore, the Project would have no adverse effect.

The Canal will still maintain its association with the development of agriculture in Imperial Valley. The potential for intact subsurface prehistoric or historic historical resources to be present on the Project property is considered very low due to extensive disturbance owed to agricultural activities. Therefore, no impacts to the significance of an archaeological resource pursuant to Section 15064.5, and no further analysis is required in the EIR.

**c) Would the project disturb any human remains, including those interred outside of formal cemeteries?**

**Finding: Less Than Significant Impact**

Subsurface human remains could be impacted during construction of the proposed Project. The proposed Project site has been historically disturbed by past agricultural practices. The Project site is currently vacant land. Although the potential for encountering subsurface human remains within the Project footprint is unlikely, there remains a possibility that human remains could be present beneath the ground surface, and that such remains could be exposed during Project construction. Therefore, potential to encounter subsurface human remains is considered a potentially significant impact unless mitigation is incorporated during construction. No subsurface disturbance will occur during Project operation. Therefore, no impacts to subsurface human remains are anticipated during operation. Decommissioning activities will involve the removal of the Battery Energy Storage System (BESS) facility structure, associated wiring, and battery cells. Earth-moving activities similar to those occurring during Project construction will occur during the decommissioning phase of the Project. The ground disturbance that would occur as a result of decommissioning would be in the same locations of disturbance that occurred during construction of the Project. Therefore, additional ground disturbances outside of those during construction are not anticipated. As such, no further disturbance of potential human remains is anticipated to occur, therefore no further analysis in the EIR is required.

In the event that evidence of human remains are discovered, construction activities within 50 feet of the discovery shall be halted or diverted, and the County Coroner will be notified (Section 7050.5 of the Health and Safety Code). If the Coroner determines that the remains are Native American, the Coroner will notify the NAHC which will designate a Most Likely Descendant (MLD) for the Project (Section 5097.98 of the Public Resources Code). The designated MLD then has 48 hours from the time access to the property is granted to make recommendations concerning treatment of the remains (AB 2641). If the landowner does not agree with the recommendations of the MLD, the NAHC can mediate (Section 5097.94 of the Public Resources Code). If no agreement is reached, the landowner must rebury the remains where they will not be further disturbed (Section 5097.98 of the Public Resources Code). This will also include either recording the site with the NAHC or the appropriate Information Center; using an open space or conservation zoning designation or easement; or recording a document with the county in which the property is located (AB 2641).

### 3.7 ENERGY RESOURCES

ENERGY RESOURCES Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less than Significant Impact	No Impact
a) Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

#### 3.7.1 Environmental Setting

IID is the electrical service provider for unincorporated County areas, including the proposed Project site. IID maintains a number of distribution and substation facilities in the County. As discussed above, the proposed Project would include the construction and operation of a 230-kV loop-in substation to connect the Project to the Campo Verde 230 kV Radial transmission line. IID is required by the California Energy Commission (CEC) to publish a power content label (IID 2018) that describes the percentage mix of IID's energy sources

In 2018, IID obtained power from the following sources:

- Renewable: 29 percent
- Large Hydroelectric 4 percent
- Natural Gas: 27 percent
- Nuclear: 3 percent

Unspecified sources of power: 37 percent IID's renewable energy sources are further broke down as follows:

- Biomass & Biowaste: 2 percent
- Geothermal: 5 percent
- Eligible Hydroelectric: 2 percent
- Solar: 11 percent
- Wind: 11 percent

There are several other renewable energy generation facilities in the vicinity of the proposed Project. The proposed Project would operate as a wholesale power storage facility, storing renewable power when demand is lower and releasing power to the grid during times of increased demand. The power would be exported to IID via the new loop-in substation that would be constructed as part of the proposed Project. As discussed above, the proposed Project would have a full build-out storage capacity of approximately 2,000 MW.

### 3.7.2 Environmental Impact Analysis

- a) **Would the project result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during Project construction or operation?**

**Finding: Less than Significant Impact**

Resources that would be consumed as a result of the proposed Project include water, electricity, and fossil fuels during construction and O&M. Construction would require the manufacture of new materials, some of which may not be recyclable at the end of the proposed Project's lifetime. The energy required for the production of these materials would also result in an irretrievable commitment of natural resources. The anticipated equipment, vehicles, and materials required for construction of the proposed Project are described above in Chapter 2; however, the amount and rate of consumption of these resources would not result in significant environmental impacts or the unnecessary, inefficient, or wasteful use of resources. Compliance with all applicable building codes, State of California, and County policies would ensure that all-natural resources are conserved to the maximum extent possible.

Construction, operation, and decommissioning of the proposed Project would result in a net increase in energy resources available for use. During operation, depending on the phase, the proposed Project would make available up to approximately 400 MW per phase of efficient, clean, renewable energy at times when demand is highest. This energy resource could be used to create other goods or more efficiently power regional services, thus ensuring that no wasteful or inefficient consumption of energy resources would occur and offsetting demand which would be met by less efficient methods of energy generation; therefore, there would be a less than significant impact to energy resources and no further analysis is required in the EIR.

Furthermore, to meet air quality requirements and save materials and fuel for economic gain, the Applicant has committed to implementing energy efficiency and fuel use reduction measures for all on-site equipment, and wherever possible during construction.

- b) **Would the project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?**

**Finding: No Impact**

The proposed Project would be compliant with all state and local plans for renewable energy or energy efficiency because it would develop a demand responsive renewable source of power, helping to offset the use of nonrenewable resources and contribute to an overall reduction of nonrenewable resources currently used to generate electricity. Additionally, the Project would increase the effectiveness of other regional renewable projects by increasing the available storage capacity; therefore, the Project would have no impact on a state or local energy plan, and no further analysis is required in the EIR.

### 3.8 GEOLOGY AND SOILS

<b>GEOLOGY AND SOILS</b> <b>Would the project:</b>	<b>Potentially Significant Impact</b>	<b>Less Than Significant with Mitigation Incorporation</b>	<b>Less than Significant Impact</b>	<b>No Impact</b>
<b>a)</b> Directly or indirectly cause substantial adverse effects, including the risk of loss, injury, or death involving:				
i. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
ii. Strong seismic ground shaking?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
iii. Seismic-related ground failure, including liquefaction?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
iv. Landslides?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
<b>b)</b> Result in substantial soil erosion or the loss of topsoil?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
<b>c)</b> Be located on strata or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<b>d)</b> Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<b>e)</b> Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<b>f)</b> Directly or indirectly destroy a unique paleontological resource or site or unique geological feature?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

#### 3.8.1 Environmental Setting

The Project site is located in the southern portion of the Salton Trough, a structural depression within the Colorado Desert geomorphic province. This province is generally a low-lying barren desert basin (in part about 230 feet below mean sea level) dominated by the Salton Sea. The province is a depressed block between active branches of the San Andreas fault system. The fault branches are buried by recent alluvial deposits. The dominant structural features related to the San Andreas fault system consist of northwest-trending faults and fault zones. The major northwest trending fault zones include the San Jacinto fault, Imperial fault, the Superstition Hills fault, the Elsinore fault and the San Andreas fault. The Salton Trough has been inundated during the Quaternary by an ancient freshwater lake (Lake Cahuilla) which resulted in

a sequence of lacustrine (lake) deposits consisting of interbedded sand silt and clay. Remnants of the ancient shorelines of the extinct Lake Cahuilla remain prevalent in the Salton Trough (NV5\_2018).

### 3.8.2 Environmental Impact Analysis

**a) Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:**

**Finding: Less Than Significant Impact**

- i. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.

The Project site is not located within an Earthquake Fault Zone delineated by the State of California for the hazard of fault surface rupture. The surface traces of known active or potentially active faults are not known to pass directly through the site. The Alquist-Priolo (AP) mapped Route 247 fault zone is located approximately 1.3 miles to the west but does not trend towards the Project site. The AP-mapped Northern Centinela fault zone is located approximately 3.3 miles to the south and trends towards the Project site. It should be noted that ground surface rupture due to a seismic event may occur in areas where no evidence of ground rupture had been previously noted. However, based on the distance to the mapped trace of the faults and the distance to other faults in the vicinity of the Project site, the potential for damage due to surface rupture due to faulting at the Project site is considered low. Therefore, impacts would be less than significant, and no further analysis is required in the EIR.

- ii. Strong seismic ground shaking?

The Project site is located in Southern California, which is considered a seismically active area, and as such, the seismic hazard most likely to impact the site is ground shaking resulting from an earthquake along one of the known active faults in the region. The seismic design of the Project may be performed using seismic design recommendations in accordance with the 2016 California Building Code (CBC). Preliminary seismic parameters were developed for the Project site based on the 2016 CBC) and American Society of Civil Engineers (ASCE) 7-10 guidance document. Using the United States Geological Survey (USGS) Ground Motion Parameter Online Calculator based on the following site coordinates: Latitude = 32.729506 degrees, and Longitude = -115.715528 degrees. The earthquake hazard level of the Maximum Considered Earthquake (MCE) is defined in ASCE 7-10 as the ground motion having a probability of exceedance of 2 percent in 50 years. Therefore, the Project would have less than significant impacts with regard to strong seismic ground shaking, and no further analysis is required in the EIR.

- iii. Seismic-related ground failure, including liquefaction?

Liquefaction and dynamic settlement of soils can be caused by ground shaking during earthquakes. Dynamic settlement due to earthquake shaking can occur in both dry or unsaturated and saturated sands. Research and historical data indicate that loose, relatively clean granular soils are susceptible to liquefaction and dynamic settlement, whereas the stability of the majority of clayey silts, silty clays and clays

is not adversely affected by ground shaking. Liquefaction is generally known to occur in saturated loose cohesionless soils at depths shallower than approximately 50 feet. The potential for liquefaction under the same conditions of ground shaking intensity and duration will decrease for sands that are more well-graded, irregular, gritty, coarser and denser. Also, a pronounced decrease in liquefaction potential will occur with the increase in fine-grained (i.e., silt and clay) content and plasticity of the soil. Idriss and Boulanger (2008) have suggested that soils with plasticity index of greater than 7 may be considered non-liquefiable. The potential consequences of liquefaction to engineered structures include loss of bearing capacity, buoyancy forces on underground structures (including pipelines), increased lateral earth pressures on retaining walls, and lateral spreading.

The Project site is underlain by poorly to moderately consolidated alluvial materials. The subsurface exploration program encountered poorly to moderately consolidated alluvial silt, clay and silty sand, along with a relatively shallow ground water table. A simplified liquefaction analysis was performed using the liquefaction triggering analysis procedure proposed by Boulanger and Idriss (2014) and the California Geological Survey (CGS) Special Publication (SP)-117 procedures using the Standard Penetration Test (SPT) data from Project site borings and historical high groundwater level of 5 feet below ground surface. A peak ground acceleration (PGA) of 0.5g for geometric-mean and earthquake moment magnitude of 6.5 based on the results of deaggregation analysis using the USGS online tools were used in liquefaction analysis. The analyses indicated that minor liquefaction effects are expected at the Project site due to presence of few isolated saturated medium dense sand layers present between depths of 15 and 50 feet below ground surface. The total seismic settlement expected at the Project site is on the order of ¼ inch which concludes that the Project is not susceptible to liquefaction. Therefore, impacts would be less than significant, and no further analysis is required in the EIR.

iv. Landslides?

There are no high or steep natural slopes on or in close proximity to the Project site. Based on the Project's Geotechnical Report, there are no indications of landslides or deep-seated instability at the Project site. Therefore, the potential damage to the proposed Project facilities due to land sliding or slope instability is considered low and potential impacts would be less than significant. No further analysis is required in the EIR.

**b) Would the project result in substantial soil erosion or the loss of topsoil?**

**Finding: Less Than Significant Impact**

Disturbance associated with site preparation activities leaves soils vulnerable to detachment by wind, resulting in net loss, or displacement. Construction soil erosion impacts are considered potentially significant short-term impacts under CEQA. Erosion is the detachment and movement of soil materials through natural processes (primarily wind or water) or human activities. Rates of erosion can generally vary according to the soil resource's capacity to drain water, slope angle and length, extent of groundcover, and human influence. Grading and excavation would be required at the Project site to create a foundation for the proposed Project facility and other required Project components. Electrical conduits and electrical wiring

would be installed and buried in designated areas throughout the Project site. However, since the existing site was previously an agricultural use and heavily farmed, only minor grading would be needed.

In compliance with federal Clean Water Act and regulations of the State Water Resource Control Board, the proposed Project would require implementation of a construction Stormwater Pollution Prevention Plan (SWPPP), including site-specific BMPs for erosion and sediment control. The SWPPP would require BMPs be adopted for the specific conditions at the Project site and would minimize any risk for substantial erosion during construction. In addition, County standards would include preparation, review and approval of a grading plan by the County Engineer and implementation of a Dust Control Plan (Rule 801) (discussed further in Section 4.1, Air Quality). A National Pollutant Discharge Elimination System (NPDES) Construction General Permit will be required for the Project because more than one acre would be disturbed. Given the relatively flat nature of the Project area and low precipitation in the area, it is unlikely that soil erosion from runoff would occur; however, with implementation of the BMPs contained in the required SWPPP, impacts would be less than significant, and no further analysis is required in the EIR.

- c) Would the project be located on geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?**

**Finding: Potentially Significant Impact**

Construction of the proposed Project could present new loading for near surface soils that might eventually cause damage to Project facilities from subsidence over time. However, the proposed improvements would be required to adhere to all applicable California Building Standards Code and would help to mitigate any potential impacts associated with subsidence or any other potentially hazardous condition associated with the ability of underlying materials to adequately support the proposed improvements. Subsidence or collapse can also occur through the rapid removal of fluids such as groundwater or petroleum from the subsurface. The proposed Project does not include the extraction of any groundwater or petroleum.

The Project site is within a topographically flat area and soils predominately consist of clays with imbedded silts and sandy silts. The native surface clays within the agricultural lands exhibit high to very high swell potential when tested according to the Uniform Building Code Standard 18-2 methods. The clay is expansive when wetted and can shrink with moisture loss (drying). Causes for soil saturation include landscape irrigation, broken utility lines, or capillary rise in moisture upon sealing the ground surface to evaporation. Moisture losses can occur with lack of landscape watering, lose proximity of structures to downslopes and root system moisture extraction from deep rooted shrubs and trees placed near the foundations. The Project site could be subject to direct impacts resulting from potential swelling forces and reduction in soil strength resulting from saturation.

Therefore, mitigation measures to replace expansive soils or condition soils to minimize expansion would be required during Project construction to reduce direct impacts associated with expansive soils. Further, adherence to applicable building code requirements and industry standard geotechnical site preparations would be required to reduce the potential impact from unstable soils. Therefore, a potentially significant

impact is identified for this issue area. A project-specific Geotechnical Study that will address the proposed Project's potential impacts on geology and soil resources, which will be further analyzed in the EIR

**d) Would the project be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?**

**Finding: Potentially Significant Impact**

Improvements including foundations and slabs in contact with earth materials with a high potential for expansion can be expected to be subject to distress based on the potential for volume change associated with highly expansive soil. Soils such as these should not be relied upon for foundation bearing. The Project site is underlain predominantly by poorly to moderately consolidated alluvial materials consisting of sandy silt to clay, silty sand and poorly graded sand with silts. Three tested samples of the near-surface silt and clay soils indicated medium to high expansion potential with an Expansion Index (EI) of 54 to 106. These materials are generally considered unsuitable for use as backfill for structure foundations, retaining walls or pipe bedding. Since site grading will redistribute on-site soils, potential expansive soil properties should be verified at the completion of rough grading for the proposed Project. Therefore, the proposed Project could be subject to potential impacts resulting from potential swelling forces and reduction in soil strength resulting from saturation. However, mitigation measures to replace expansive soils or condition soils to minimize expansion would need to be implemented during Project construction to reduce direct impacts associated with expansive soils. Thus, a potentially significant impact is identified for this issue area. A Geotechnical Study that will address the proposed Project's potential impacts on geology and soil resources will be prepared and will be further analyzed in the EIR.

**e) Would the project have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?**

**Finding: Potentially Significant Impact**

The Project proposes the construction of an on-site septic systems. Therefore, a potentially significant impact is identified for this issue area. A Geotechnical Study that will address the proposed Project's potential impacts on geology and soil resources will be further analyzed in the EIR.

**f) Would the project directly or indirectly destroy a unique paleontological resource or site or unique geological feature?**

**Finding: Potentially Significant Impact**

Construction activities on the Project site would occur on a previously heavily farmed agricultural field. Deposits near the ground surface (approximately five feet in depth) were subject to disking, tilling, and planting for years, effectively compromising any fossil deposits that may have once been present. No direct impacts to paleontological resources are anticipated in association with operation and maintenance of the Project. Indirect impacts to paleontological resources during operation and maintenance would be low because no major ground disturbing activities or excavations would be anticipated as part of routine

maintenance. When the proposed Project reaches the end of its operational life, Project components would be decommissioned and deconstructed. Concrete foundations would be removed to a depth of at least four feet below ground level and demolished; driven piles would be removed from the ground. Other concrete foundations, such as those for buildings, would be demolished and removed or used on-site for fill as needed. Excavation areas (e.g., foundation removal) would be backfilled and restored to an appropriate contour. Areas subject to decommissioning would have been disturbed during construction. Mitigation measures could be needed to address construction-related impacts to paleontological resources, as direct and indirect impacts to paleontological resources during construction, operation and decommissioning of the proposed Project could be potentially significant. A Geotechnical Study that will address the proposed Project's potential impacts on geology and soil will be prepared, and this issue will be further analyzed in the EIR.

### 3.9 GREENHOUSE GASES

GREENHOUSE GAS EMISSIONS Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less than Significant Impact	No Impact
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

#### 3.9.1 Environmental Setting

Greenhouse gas (GHG) and climate change are a cumulative global issue, therefore its analysis is cumulative in nature. The United States Environmental Protection Agency (USEPA) and the California Air Resources Board (CARB) regulate GHG emissions within the United States and California respectively. CARB has primary regulatory responsibility within California for GHG emissions. However local agencies can also adopt policies for GHG emission reduction. The proposed Project is located in the local jurisdiction of the Imperial County APCD. The principal GHGs resulting from human activity that enter and accumulate in the atmosphere are listed below:

- **Carbon Dioxide:** CO<sub>2</sub> enters the atmosphere through the burning of fossil fuels (oil, natural gas, and coal), solid waste, trees and wood products, and chemical reactions (e.g., the manufacture of cement). CO<sub>2</sub> is also removed from the atmosphere (or “sequestered”) when it is absorbed by plants as part of the biological carbon cycle.
- **Fluorinated Gases:** Hydrofluorocarbons (HFCs), perfluorinated chemicals (PFCs), and Sulfur hexafluoride (SF<sub>6</sub>) are synthetic, powerful climate-change gases that are emitted from a variety of industrial processes. Fluorinated gases are often used as substitutes for O<sub>3</sub>-depleting substances (i.e., chlorofluorocarbons, hydrochlorofluorocarbons, and halons). These gases are typically emitted in smaller quantities, but because they are potent climate-change gases, they are sometimes referred to as high global warming potential (GWP) gases.
- **Methane:** CH<sub>4</sub> is emitted during the production and transport of coal, natural gas, and oil. CH<sub>4</sub> emissions also result from livestock and agricultural practices and the decay of organic waste in municipal solid waste landfills.
- **Nitrous Oxide:** N<sub>2</sub>O is emitted during agricultural and industrial activities as well as during combustion of fossil fuels and solid waste.

According to Assembly Bill (AB) 32, California’s Global Warming Solutions Act, GHGs of concern include the following gases: CO<sub>2</sub>, CH<sub>4</sub>, N<sub>2</sub>O, PFCs, SF<sub>6</sub>, and HFCs. The primary GHGs that would be generated by the proposed Project would include CO<sub>2</sub>, CH<sub>4</sub>, and N<sub>2</sub>O. As a method of simplifying reporting, GHG

emissions are discussed in terms of metric tons of carbon dioxide equivalents (CO<sub>2</sub>e), which accounts for the relative warming capacity (i.e., GWP) of each gas.

### **3.9.2 Environmental Impact Analysis**

- a) Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?**

**Finding: Potentially Significant Impact**

The proposed Project would generate GHG emissions during both construction and operation. These emissions would be generated from multiple sources, including mobile equipment and other combustion engines such as water pumps. Therefore, the construction of these facilities has the potential to cause significant environmental effects through the generation of greenhouse gas emissions which may have a significant impact on the environment. These impacts will be analyzed further in the EIR.

- b) Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?**

**Finding: Potentially Significant Impact**

The proposed Project would generate greenhouse gas emissions primarily during the construction of the proposed Project. There are a number of applicable plans, policies, and regulations adopted for the purposes of reducing the emissions of greenhouse gases. These include executive orders, senate bills, assembly bills, and other state agency specific planning documents.

The construction of these facilities has the potential to cause significant environmental effects through conflict with an applicable plan, policy, or regulation due to the greenhouse gases generated during construction and operation of the Project. Therefore, these impacts will be analyzed further in the EIR.

### 3.10 HAZARDS AND HAZARDOUS MATERIALS

HAZARDS AND HAZARDOUS MATERIALS Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less than Significant Impact	No Impact
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

#### 3.10.1 Environmental Setting

As discussed above in Chapter 2, the Project site is approximately one-third mile north of the IV Substation and directly south of the intersection of Liebert Road and the IID Canal. The Project site is bounded by the Westside Main Canal to the north, BLM lands to the south and west, and vacant private land to the east. The Campo Verde solar generation facility is located north of the Project site, across the Canal.

Fire protection systems for battery systems would be designed in accordance with California Fire Code 2016 and would take into consideration the recommendations of NFPA 855. Depending on the battery technology used in a phase, fire suppression agents such as Novec 1230 or FM 200, or water may be used as a suppressant, depending on what is most effective. In addition, fire prevention methods would be implemented to reduce potential fire risk, including voltage, current and temperature alarms. Energy storage equipment would comply with UL-9540 and would account for the results of UL-9540A. As discussed above in Chapter 2, the proposed Project has the potential to utilizing either lithium-ion batteries and/or flow batteries. Flow batteries are generally not flammable and do not require fire suppression

systems. In locations where equipment is located within buildings, automated fire sprinkler systems will be designed in accordance with California Fire Code Section 903. A fire loop system and fire hydrants will be located throughout the site for general fire suppression. Buildings and containers for both lithium-ion and flow batteries will be unoccupied enclosures. These buildings will also have automatic sprinkler systems designed in accordance with California Fire Code Section 903.

### **3.10.2 Environmental Impact Analysis**

- a) Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?**

**Finding: Potentially Significant Impact**

The proposed Project would routinely transport and use hazardous materials, including battery storage components and fuels such as gasoline would be necessary to support construction and operational activities. Disposal of battery components could contain potentially hazardous materials. Implementation of industry standards would serve to reduce the potential for a hazard resulting from the use of these materials. Therefore, a more detailed evaluation of the potential significant impacts associated with routine hazardous material transport, use, and disposal is required, and this potentially significant impact will be further analyzed in the EIR.

- b) Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?**

**Finding: Potentially Significant Impact**

The proposed Project would result in the installation and operation of a battery storage facility. Should an upset or accidental condition occur, such as a thermal runaway event, hazardous materials from the battery storage facility could be potentially released into the environment. Therefore, a more detailed evaluation of the potential significant impacts associated with reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment is required, and this potentially significant impact will be further analyzed in the EIR.

- c) Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?**

**Finding: No Impact**

As discussed above in Chapter 2, the proposed Project site is located in a remote area of the County and is not located within one-quarter mile of an existing or proposed school. The nearest school to the proposed Project is the Westside Elementary School, which was closed in 2013, is located approximately 2.1 miles north of the Project site. While the school is currently closed, it could be reopened in the future. The nearest active school to the proposed Project is Seeley Elementary School, located approximately 4.6 miles north of the Project. A review was conducted of existing publicly available information from the County Office of

Education and the Seeley Union School District to determine if any proposed schools would be located within one-quarter mile of the proposed Project site. No proposed schools were identified. Therefore, the Project is not located within one-quarter mile of an existing or proposed school, and no impact would occur. No further analysis is required in the EIR.

- d) Would the project be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?**

**Finding: No Impact**

The proposed Project is not located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5, as outlined on the Geotracker and Envirostor databases (DTSC 2020, SWRCB 2020). As a result, the proposed Project would not create a significant hazard to the public or environment, and no impact would occur. No further analysis is required in the EIR.

- e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public or private airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?**

**Finding: No Impact**

The proposed Project site is not located within the bounds of any airport land use plans, as outlined in the County of Imperial Airport Land Use Compatibility Plan (Imperial 1996). Therefore, the proposed Project would not result in a safety hazard or excessive noise for people residing or working in the Project area, and no impact would occur. No further evaluation is required in the EIR.

- f) Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?**

**Finding: No Impact**

The proposed Project would be required to comply with all applicable emergency response plans and emergency evacuation plans as a condition of proposed Project approvals, as discussed above in Table 2, and in accordance with state and local regulations (Health and Safety Code, §25500-25520 and Cal. Code Reg., tit. 19, § 2720 et seq.).

The proposed Project does not include construction of residences or facilities that would require significant evacuation. During Project operation, up to twenty employees would be present. This number of employees would be accommodated under existing emergency response plans and emergency evacuation plans. The proposed Project would not remove roadways or regional access points and would increase local access via the new bridge. As such, the proposed Project would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. Therefore, there would be no impact to adopted emergency plans, and no further evaluation is required in the EIR.

- g) Would the project expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?**

**Finding: No Impact**

Discussed in further detail below in Section 3.20, Wildfire, the proposed Project is not located in an area mapped as a Very High Fire Hazard Severity Zone (VHFHSZ), nor is it in an area where nearby wildlands are present. Therefore, there would no impact to people or structures, and no further evaluation is required in the EIR.

### 3.11 HYDROLOGY AND WATER QUALITY

HYDROLOGY AND WATER QUALITY Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less than Significant Impact	No Impact
a) Violate water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would: <ul style="list-style-type: none"> <li>i. Result in substantial erosion or siltation on- or off-site;</li> <li>ii. Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site;</li> <li>iii. Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or</li> <li>iv. Impede or redirect flood flows.</li> </ul>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
e) Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

#### 3.11.1 Environmental Setting

The proposed Project site is located within the Salton Sea Transboundary Watershed within the Colorado River Basin Region (Biotech report citation). The site is bifurcated by the Westside Main Canal, a man-made, natural bottomed canal used by IID to convey water from the All-American Canal to the greater Imperial Valley area, primarily for irrigation and agricultural usages. The Westside Main Canal starts in the northern portion of the Project site and flows from east to west. In the nearby vicinity to the Project site, the Fern Check drop structure helps regulate water levels within the canal. Additionally, manufactured drainage ditches, both concrete lined and natural bottomed, occur along berms that define the boundaries of the abandoned agricultural fields which make up the Project site, but these ditches are non-functional. According to the Department of Water Resources (DWR 2020), the proposed Project overlies the Coyote Wells Valley groundwater basin.

Throughout the site, the elevation ranges from approximately sea level on the southwest portion to approximately 24 feet below sea level in the northeast corner. Delineated on Flood Insurance Rate Map

panel 06025C2050C, the proposed Project lies within the Federal Emergency Management Agency (FEMA) Special Flood Hazard Area Zone X. Areas mapped as Zone X are areas of moderate to minimal flood hazard, having an average annual average change of less than 0.2 percent.

Given the phased nature of the proposed Project, it is assumed that the total amount of impervious surfaces is potentially speculative. Therefore, for the purpose of this analysis, it is conservatively assumed that the entire Project site would be covered with impervious surfaces, with the exception of the proposed drainage basins. This additional potential impervious surface area represents approximately 154.84 acres.

### 3.11.2 Environmental Impact Analysis

**d) Would the project violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality?**

**Finding: Potentially Significant Impact**

The proposed Project would result in the installation of a battery energy storage facility including a loop-in substation, a solar PV facility, a new bridge across the Westside Canal, and other associated pieces of infrastructure such as new drainage basins. Construction of the Project would require 210 AF of water for dust suppression and other construction activities (such as concrete preparation). Water used for dust suppression would not contain contaminants. The accidental release or mobilization of contaminants during construction or operation of the proposed Project could potentially result in water quality degradation within the Coyote Wells Valley Groundwater Basin. Potentially hazardous materials may include diesel fuel, gasoline, lubricant oils, hydraulic fluid, antifreeze, transmission fluid, lubricant grease, and other fluids required for the operation of construction vehicles. Motorized equipment used at the proposed Project site during the construction or operation could leak potentially hazardous materials due to unnoticed or unrepaired damage, improper fueling, or operator error. This type of leak could occur either on the proposed Project site or on the vehicle and equipment routes between the off-site origin point and the proposed Project site. Any activities that require the use of motorized equipment may result in the accidental spill or release of potentially hazardous materials.

Direct contact with potentially hazardous materials could result from a leak or spill that occurs directly above or within the bed and banks of a flowing stream or waterbody. Additionally, the low risk of a thermal runaway event does present the potential for toxics to mobilize into the surrounding environment and throughout the regional water system via the Westside Canal. As a potentially significant impact could occur, this issue will be analyzed further in the EIR.

**b) Would the project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?**

**Finding: Less Than Significant Impact**

As discussed above, the proposed Project would result in approximately 154.84 acres of new impervious surfaces. The water for Project construction and operation would be sourced via a new connection to the

Westside Main Canal, and a Will Serve letter from the local water purveyor (IID) was requested by the Applicant from the IID Water Manager, in February 2020. Water would not be sourced from the local groundwater basin.

The rate and amount of recharge and surface runoff is determined by multiple factors, including amount and intensity of precipitation, amount of other imported water that enters a watershed, and amount of precipitation and imported water that infiltrates to the groundwater. Infiltration is determined by several factors, including soil type, antecedent soil moisture, rainfall intensity, the number of impervious surfaces within a watershed, and topography. The rate of surface runoff is largely determined by topography and the intensity of rainfall over a given period of time. Changes in groundwater recharge alter the quantity of groundwater available to the environment, existing users, and other proposed projects. Projects that grade the land surface, remove vegetation, alter the conveyance and control of runoff, or cover the land with impervious surfaces alter the relationships between rainfall, runoff, infiltration and evapotranspiration. Total Project acreage is an indicator of the magnitude of the land surface disturbance and potential to alter runoff, infiltration and transpiration. The Coyote Wells Valley Groundwater Basin is approximately 64,000 acres in size (California's Groundwater Bulletin, 2004). Therefore, the proposed Project would conservatively represent an increase of approximately 0.2 percent, with the actual amount of impervious surfaces constructed anticipated to be less than the approximately 154.84 acres indicated above. Additionally, as described above in Chapter 2, the proposed Project would include the construction and operation of detention basins to preserve infiltration capacity for all stormwater and rainfall that were to enter the site.

Given the small percentage of the overall groundwater basin that would be rendered impervious by the proposed Project, the presence of the detention basis, and the lack of groundwater required for the proposed Project, a less than significant impact would occur. No further analysis of this issue is required in the EIR.

- c) Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would;**
- i. Result in substantial erosion or siltation on- or off-site;**
  - ii. Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site;**
  - iii. Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or**
  - iv. Impede or redirect flood flows.**

**Finding: Potentially Significant Impact**

As discussed above, due to the phased nature of the proposed Project, there is the potential that the entire Project site (with the exception of the infiltration basins) would be rendered impervious. Therefore, a potentially significant impact could occur, and this impact will be analyzed further in the EIR.

**d) Would the project in flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?**

**Finding: No Impact**

The proposed Project is located within the Mt. Signal area of Imperial County, which is not located within a tsunami or seiche zone. People or structures would not be exposed to hazards associated with seiche, tsunami, or mudflow since no large bodies of water exist near the proposed Project site. The Pacific Ocean is approximately 83.1 miles from the proposed Project site and separated by the barrier of the Peninsular Mountain Ranges. No water bodies capable of producing a seiche are located near the proposed Project site. The nearest large water body is the Salton Sea, located approximately 25.1 miles north of the Project, and is not directly connected to the Westside Canal, the nearest hydrologic feature to the Project.

Discussed above, portions of the proposed Project site fall within FEMA Flood Hazard Zone X. These areas reflect hazard zones that have a minimal to moderate risk of a 0.2 percent annual chance (100-year) flood each year. This flooding hazard reflects a baseline condition that exists prior to the construction of the proposed Project, and construction of the proposed Project would not alter the existing flood hazard. Therefore, as the proposed Project is not located in a flood hazard, tsunami, or seiche zone, and no impact from inundation would occur. As such, no further analysis is required in the EIR.

**e) Would the project conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?**

**Finding: No Impact**

The proposed Project would be constructed and operated in accordance with all applicable regulations and plans, including regional water quality control plans and sustainable groundwater management plans. As such, the proposed Project would not conflict with or obstruct the implementation of these plans, and no impact would occur. As such, no further evaluation is required in the EIR.

### 3.12 LAND USE AND PLANNING

LAND USE AND PLANNING Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less than Significant Impact	No Impact
a) Physically divide an established community?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

#### 3.12.1 Environmental Setting

The proposed Project site and surrounding parcels to the north and east have a land use designation of Agricultural (A-3), according to the County General Plan land use designations. Areas to the west and southwest are lands designated as open space/recreation areas. Lands southwest of the proposed Project site are BLM lands and are not subjected to County zoning designations (Imperial 2020).

According to the Imperial County Municipal Code, Section 90509.01 Permitted Uses in the A-3 Zone, the proposed Project component conflicts with the allowable uses in the A-3 Zone. Therefore, the Project proposes a General Plan Amendment and Zone Change to change the land use designation and zoning for the Project site from Agriculture (A-3) to Medium Industrial (M-2), specifically limited to Energy Production/Use.

#### 3.12.2 Environmental Impact Analysis

##### a) Would the project physically divide an established community?

##### Finding: No Impact

The proposed Project would not physically divide any established community. The Project site is located in a portion of the County with similar industrial solar generation projects. The rest of the area is predominately agricultural, with a scattering of residences. The Project does not vacate any roads used by residents to connect with an established community. Temporary construction activities would access the Project site from the south side of the Canal, off SR-98, and/or from the north side of the Canal, from I-8. Construction activities would occur Monday through Friday between the hours of 7:00 a.m. and 7:00 p.m. Temporary access would be used until the construction of the permanent bridge is completed. Upon Project completion, approximately 60 feet of frontage road along the north Project fence line, south of the IID maintenance road, and a Caltrans specified bridge over the Canal, will provide public access to and from the Project site. Therefore, no impact would occur, and no further analysis of this topic is required in the EIR.

- b) Would the project cause a significant environmental impact due to a conflict with any applicable land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?**

**Finding: Potentially Significant Impact**

The proposed Project site is currently zoned Agriculture (A-3), and the Project is proposing a General Plan Amendment and Zone Change to change the land use designation and zoning for the Project site to Medium Industrial (M-2), with the Industrial use zoning limited to Energy Production/Use. As such, the potential impact of this zone change will be analyzed further in the EIR.

### 3.13 MINERAL RESOURCES

MINERAL RESOURCES Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less than Significant Impact	No Impact
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

#### 3.13.1 Environmental Setting

According to the Imperial County General Plan Conservation & Open Space Element (Imperial 2016), there are a number of mineral extraction operations currently operating within the County, including extraction of precious minerals, such as gold, Construction and building materials such as clay, gravel, gypsum, lime, limestone, sand, stone, tuff, and other raw materials such as kyanite, manganese, micas, and potash. In Figure 8 of the Conservation and Open Space Element, existing mineral resources within the County are depicted, none of which are located in or near the proposed Project site. Additionally, mapping by the California Department of Conservation indicates that there are no mapped mineral resource zones (MRZ) in or near the proposed Project site (DOC 2015).

#### 3.13.2 Environmental Impact Analysis

- a) **Would the project result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?**

**Finding: No Impact**

As discussed above, the proposed Project would not be located on or near known mineral resources classified as MRZ-2 by the State Geologist. No MRZ's are located in or near the proposed Project site. Therefore, no impact would occur, and no further evaluation is required in the EIR.

- b) **Would the project result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?**

**Finding: No Impact**

As discussed above, the proposed Project would not be located in or near known mineral resources, or mineral resources delineated on a local general plan, specific plan, or other land use plan (including the County of Imperial General Plan). Therefore, no impact would occur, and no further evaluation is required in the EIR.

### 3.14 NOISE

NOISE Would the project result in:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less than Significant Impact	No Impact
a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Generation of excessive groundborne vibration or groundborne noise levels.	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
c) For a project located within the vicinity of a private airstrip or an airport land use plan, or where such a plan has not been adopted within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

#### 3.14.1 Environmental Setting

As discussed above in Chapter 2, the proposed Project would include a General Plan Amendment and Zone change to change the land use designation and zoning for the Project site from Agriculture (A3) to Industrial. The construction of the access road and the bridge over the Westside Main Canal would last for eight to nine months. The Project would then grade/disturb the entire site and construction would last for approximately 32 months.

The County's General Plan Noise Element establishes construction time of day restrictions and noise level limits. Construction activities may only occur Monday through Friday between the hours of 7:00 a.m. and 7:00 p.m. or Saturday between the hours of 9:00 a.m. and 5:00 p.m., excluding holidays. Additionally, construction noise may not exceed 75 A-weighted decibel [dB(A)] 8-hour equivalent noise level [Leq (8h)] at the nearest sensitive receptor (Imperial 2015).

Imperial County Noise Abatement and Control. County Code of Ordinances Title 9, Division 7: Noise Abatement and Control, specifies noise level limits. Noise level limits are summarized in the table below. Noise level limits do not apply to construction equipment.

**Table 5: Imperial County Property Line Noise Limits**

Zone	Time	One-Hour Average Sound Level [dB(A) Leq]
Low Density Residential Zones	7:00 a.m. to 10:00 p.m.	50
	10:00 p.m. to 7:00 a.m.	45
Medium to High-Density Residential Zones	7:00 a.m. to 10:00 p.m.	55
	10:00 p.m. to 7:00 a.m.	50
Commercial Zones	7:00 a.m. to 10:00 p.m.	60
	10:00 p.m. to 7:00 a.m.	55
Manufacturing / Light Industrial / Industrial Park Zones including agriculture	(anytime)	70
General Industrial Zones	(anytime)	75

Source: Imperial County Board of Supervisors 2017

### 3.14.2 Environmental Impact Analysis

- a) **Would the project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?**

**Finding: Less Than Significant Impact**

Noise associated with construction and operation of the proposed Project would potentially result in short-term impacts to the surrounding properties; however, there are no nearby residences which would be affected by the noise associated with either the construction or operation of the proposed Project. As modeled in the Noise Technical Report, the maximum construction noise levels would be well below 75 dB(A)  $L_{eq(8h)}$  at the nearest residential properties. As discussed above, the County General Plan Noise Element establishes the construction time of day restrictions and noise level limits. Construction activities would only occur between Monday through Friday, between the hours of 7:00 am and 7:00 pm, or Saturday between the hours of 9:00 am and 5:00 pm, excluding holidays. Therefore, construction of the Project would not result in a generation of a substantial temporary increase in ambient noise levels in excess of standards established in the local general plan or noise ordinance.

Operational sources of noise associated with the Project would include air cooling units, inverters, transformers, the substation, and the transmission gen-tie in lines. The O&M Building and the battery storage modules would also include HVAC units. As modeled in the Noise Technical Report, the noise associated with the Project operation would attenuate to less than 60 dB(a)  $L_{eq(8h)}$  within the Project boundary. Noise levels would not exceed the applicable property line noise level limit of 70 dB(A) at the nearby adjacent properties. Therefore, the Project would not result in a generation of substantial temporary or permanent increase in ambient noise levels in the vicinity of the Project in excess of standards established in the local general plan or noise ordinance, or applicable standards, and impacts would be less than significant. No further evaluation is required in the EIR.

**b) Would the project exposure of persons to or generation of excessive ground borne vibration or ground borne noise levels?**

**Finding: Less Than Significant Impact**

The nearest sensitive receptor to the proposed Project is a residence located approximately 0.85 mile from the Project's property line. The table below summarizes the general estimation of ground vibration from typical construction equipment at several distance,s based on methods specified in the Federal Transit Administration's Transit Noise and Vibration Impact Assessment (FTA 2006).

**Table 6: Vibration from Construction Equipment**

Equipment	PPV at 25 Feet	PPV at 50 Feet	PPV at 75 Feet	PPV at 100 Feet	PPV at 175 Feet
Pile driver (sonic/vibratory)	0.734	0.2595	0.1413	0.0918	0.0396
Large bulldozer	0.089	0.0315	0.0171	0.0111	0.0048
Loaded trucks	0.076	0.0269	0.0146	0.0095	0.0041
Jackhammer	0.035	0.0124	0.0067	0.0044	0.0019
Small bulldozer	0.003	0.0011	0.0006	0.0004	0.0002

Note:

PPV = peak particle velocity

Source: FTA 2006

The main vibratory sources from the proposed Project would be generated during construction activities and would be temporary and of short duration. The County of Imperial General Plan or Noise Ordinance do not contain any specific performance standards for vibration. Therefore, a vibration analysis exceeding 0.1 PPV would be considered the threshold of concern. At this level, the vibration would be somewhere between barely perceptible and distinctly perceptible by humans, with a doubling of vibration level still required to potentially generate damage to structures. As demonstrated above, typical construction equipment would not exceed 0.1 PPV outside of the Project site, and the nearest residence to the Project is approximately 4,448 feet from the Project. Therefore, vibration generated by the proposed Project would not be excessive, and impacts would be less than significant. No further evaluation is required in the EIR.

- c) For a project located within the vicinity of a private airstrip or an airport land use plan, or where such a plan has not been adopted within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?**

**Finding: No Impact**

As discussed above in Section 3.10, the proposed Project site is not located within the bounds of any airport land use plans, as outlined in the County of Imperial Airport Land Use Compatibility Plan (Imperial, 1996). Therefore, the proposed Project would not result in a safety hazard or excessive noise for people residing or working in the Project area, and no impact would occur. No further evaluation is required in the EIR.

### 3.15 POPULATION AND HOUSING

POPULATION AND HOUSING Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less than Significant Impact	No Impact
a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

#### 3.15.1 Environmental Setting

As discussed above in Section 2 (Project Description), the proposed Project is located within the unincorporated Mount Signal area of the County of Imperial, approximately 8 miles southwest of the City of El Centro, and approximately 5.3 miles north of the U.S. – Mexico Border.

Within the unincorporated areas of Imperial County, there are 10 townsites which serve as population centers and where future population growth is being directed. These are Bombay Beach, Desert Shores, Heber, Niland, Ocotillo/Nomirage, Palo Verde, Salton City/Vista Del Mar, Salton Sea Beach, Seeley, and Winterhaven. Mount Signal is not a designated townsite. The closest townsite to the Project is Seeley, located approximately 4.56 miles to the north, followed by Heber, approximately 10.8 miles to the east.

According to the County of Imperial Housing Element (Imperial 2013), the total population of the County was 174,528 in 2010. Table 7, Imperial County Population Trends, illustrates the populations trends in the vicinity of the Project. As discussed above in Section 2, the Project would require approximately 200 workers during peak construction, and 20 employees during operation.

**Table 7: Imperial County Population Trends**

Area	2000	2010	Change	
			Number	Percentage
Bombay Beach	395	295	-100	-25%
Desert Shores	805	1,104	299	37%
Heber	3,007	4,275	1,268	42%
Niland	1,205	1,006	-199	-17%
Ocotillo	312	266	-46	-15%
Palo Verde	279	171	-108	-39%
Salton City	944	3,762	2,819	299%
Salton Sea Beach	440	422	-18	-4%
Seeley	1,576	1,739	163	10%
Winterhaven	522	394	-128	-25%
<b>Total Townsites</b>	<b>9,485</b>	<b>13,435</b>	<b>3,950</b>	<b>42%</b>
Remaining Unincorporated	23,380	24,343	963	4%
<b>Total Unincorporated County</b>	<b>32,865</b>	<b>37,778</b>	<b>4,913</b>	<b>15%</b>
<b>Total County</b>	<b>142,361</b>	<b>174,528</b>	<b>32,167</b>	<b>23%</b>

\*The remaining area of the County not covered by the designated townsites or incorporated cities.  
Source: (Imperial 2013)

Additionally, the Imperial County General Plan contains information on the housing supply within the County. According to the 2010 US Census, there was a vacancy rate of approximately 27 percent within the unincorporated County and a 12 percent vacancy rate in the county as a whole, potentially indicating that demand is lower than supply (Imperial 2013). Approximately half of the vacancies within the unincorporated County are available for seasonal or recreational use (Imperial 2013). Table 8, Housing Tenure and Vacancy, below, outlines the tenure and vacancy rates for housing within the County.

**Table 8: Housing Tenure and Vacancy**

Tenure and Vacancy Status	Unincorporated County		Total County	
	Number	Percentage	Number	Percentage
Occupied	10,436	73%	49,126	88%
Owner-Occupied	6,708	64%	27,465	56%
Renter-Occupied	3,728	36%	21,661	44%
Vacant	3,899	27%	6,941	12%
For Rent	356	9%	1,762	19%
For Sale	275	7%	1,019	12%
Rented or sold, not occupied	137	4%	381	7%
Seasonal or Recreational Use	1,805	46%	2,046	32%
Migrant worker housing	14	<1%	14	<1%
Other	1,312	34%	1,719	30%
<b>Total housing Units</b>	<b>14,335</b>	<b>100%</b>	<b>56,067</b>	<b>100%</b>

According to the County of Imperial General Plan Housing Element (Imperial 2013), the County had a quantified objective of 1,455 new units, and a Regional Housing needs Allocation of 13,427 for the planning period. However, the County was able to issue permits for 337 new homes between 2008 and 2012. This reflects an excess capacity for planned population growth in the Project area that was not utilized.

### 3.15.2 Environmental Impact Analysis

- a) **Would the project induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?**

#### **Finding: Less Than Significant Impact**

As discussed above, the proposed Project would require up to 200 employees during peak construction activities and would employ approximately 20 staff during operations and maintenance activities. Construction activities are expected to take approximately 10 years to complete. Therefore, it is assumed that the construction workers would be likely to settle or relocate near the proposed Project site.

According to the United States Census, (Census, 2018b) Seeley (the closest townsite to the proposed Project) has approximately 595 total housing units, with 139 vacant housing units, a 23.4% vacancy rate. The same survey (Census, 2018a) determined that Heber, the second closest townsite, has approximately 1,317 total housing units, with 188 vacant housing units, a 14.3% vacancy rate. Additionally, as shown above, the greater unincorporated County of Imperial has approximately 3,899 vacant housing units, a 27% vacancy rate.

Therefore, there are approximately 327 vacant housing units in the nearby vicinity of the proposed Project, and approximately ten times that available in the unincorporated County. Additionally, it is assumed that some portion of the Project's construction workforce would be existing nearby residents to the proposed Project, further reducing the Projects potential effect on local population growth. If the entire construction workforce was drawn from outside the area or the County, it could be easily accommodated with the existing vacant housing unit supply and would not require the construction of new housing units to accommodate the Project. Additionally, the Project area has an excess of planned housing and population growth in the area, with a goal of 1,455 new units during the most recent General Plan cycle, and only 335 new units constructed. Even if new housing was constructed for Project staff, it would not exceed the regional planned limits.

The Project would install new roads and improve existing infrastructure to improve access to the Site. However, access would be only to the site, and would not include access improvements to the surrounding area which would stimulate population growth. Therefore, the Project would have a less than significant impact on local population growth, and no further analysis of this topic is required in the EIR.

**b) Would the project displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?**

**Finding: No Impact**

The proposed Project site contains no housing units of any kind. No portion of the proposed Project would remove any available housing units or displace any numbers of existing people or housing. Therefore, no construction of replacement housing elsewhere would be required, and no impact would occur. No further analysis is required in the EIR.

### 3.16 PUBLIC SERVICES

PUBLIC SERVICES Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less than Significant Impact	No Impact
a) Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:				
i) Fire protection?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
ii) Police protection?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
iii) Schools?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
iv) Parks?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
v) Other Public Facilities?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

#### 3.16.1 Environmental Setting

##### Fire Protection

Imperial County Fire Department and Office of Emergency Services (ICFD/OES) provides fire protection service to the Project site. There are eight stations in the County manned with firefighters located in the communities of Heber, Seeley, Ocotillo, Palo Verde, Niland, Winterhaven, and the Cities of El Centro and Imperial. The closest fire station to the Project site is Station 2, located at 1078 Dogwood Road, in Heber, which is approximately 12 miles east of the Project site.

The proposed Project is located within the Federal Responsibility Area (FRA) according to the Department of Forest and Fire Protection (CALFIRE) State Responsibility Area (SRA) Map (CalFire 2007). Fire protection, medical emergency services, technical rescue, hazardous material incident responses, and aircraft rescue firefighting services are provided by the Imperial County Fire Department/Office of Emergency Services (ICFD/OES) to the unincorporated areas and townships of the County (ICFD/OES 2020).

##### Police Protection

The Imperial County Sheriff's Office (ICSO) provides police services to the unincorporated areas of the County (ICSO 2020a). ICSO patrol is divided between the North County, South County, and Palo Verde Patrols (ICSO 2020b). South County division patrols the area of the proposed Project site, operating out of Sheriff's Office at 328 Applestill Road, in El Centro, approximately 12 miles east of the Project site.

## Schools

The Imperial County Office of Education (ICOE) provides all educational services to the County. The County has twenty-one different school districts. The nearest school to the proposed Project is Seeley Elementary School, located approximately 4.7 miles to the northeast.

## Parks

The proposed Project would utilize a small portion of BLM land approximately 0.35 mile to the southwest of the Project site (Imperial 2020). This land is not a part of the Jacumba Wilderness area and is designated as a recreational use (BLM 2020), which is located over 25 miles west of the Project site. The nearest recreational use area for public use is the Rio Bend RV and Golf Resort, which is located approximately 2.95 miles to the northwest of the proposed Project.

## Other Public Facilities – Libraries

The proposed Project could utilize library resources in the local community. The closest library to the Project site is the Imperial County Free Library, located at 1132 Heber Avenue, in Heber, which is over 12 miles east of the Project site.

### 3.16.2 Environmental Impact Analysis

- a) **Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:**

- i. **Fire Protection?**

#### **Finding: Less than Significant Impact**

Fire protection service to the Project site is provided by Imperial County Fire Department, and the closest station is Station 2, located in Heber, approximately 12 miles east of the Project site. The station is staffed with a Captain, Firefighter and Reserve Firefighter and also has office space for the Office of Emergency Services and for other shared County services, including the Sheriff and the Emergency Operations Center (ICFD/OES 2012). Every station as a Type I fire engine as its primary apparatus, but the Station 2 is also equipped with a ladder truck, a Type III engine and has a Hazardous Materials unit. For unincorporated County areas, including rural zones, emergency response times averaged 17 minutes (ICFD/OES 2012). The County forecasts for increased demand in fire and emergency medical services is commensurate with population and business growth trends, and the anticipated increase in demand is considered modest through 2035 (ICFD/OES 2012).

Increased demand in fire protection and emergency services are usually tied to an increase in residential population. As there are no residential uses proposed as part of the Project, fire and emergency service demand is anticipated to be relatively modest. During Project construction, a maximum of 200 employees

may be working on the Project site at one time, with the need for approximately 20 employees anticipated on-site during Project operation and maintenance after Project buildout. This relatively small number of permanent employees would not result in a significant increase in the need for fire protection and emergency services, based on County forecasts. The proposed Project would include a fire protection system for all battery systems on site. The fire protection system will be design in accordance with California Fire Code 2016 and will take into consideration the recommendations of NFPA 855. Fire prevention methods would also be used to reduce potential risks, including voltage, current, and temperature alarms. In areas where equipment is located within buildings, automated fire sprinklers systems would be installed in accordance with California Fire Code. On the Project site, a fire loop system and fire hydrants will be accessible for general fire suppression. The unoccupied enclosures to contain both lithium-ion and flow batteries will have automated sprinkler systems design to California Fire Code Section 903 standards.

Separate methods of failure detection will be implemented such as alarms from the Battery Management System (BMS) including voltage, current, and temperature. Other preventative methods for fire protection include off gas detection, ventilation, overcurrent protection, battery controls with designated parameters, smoke detection, and maintenance in accordance with manufacturer guidelines. Remote alarms will be installed for operations personnel as well as emergency response teams. An Incidence Response Plan will be implemented in accordance with the technology (Lithium-ion or flow battery) installed during each phase. An additional fire protection and prevention plan proposed for the Project is the purchase or proportionate share to purchase a Type 1 Fire Engine meeting all NFPA standards for structural firefighting for the Imperial County Fire Department. Should an accident or fire occur requiring fire protection services beyond the proposed fire protection and prevention methods, the County Fire Department would be able to provide emergency services. Furthermore, the County requires the payment of impact fees for all new development projects, and Fire Impact Fees would be imposed pursuant to County Ordinance 1418, Section 2 (2006). Fees for non-residential uses would be assessed based on the project size and demand for services. With the payment of required fees and incorporation of on-site fire protection measures, the proposed Project would not substantially increase the need for fire protection, and this impact would be less than significant impact. No further analysis of this topic is required in the EIR.

## **ii. Police Services?**

### **Finding: Less than Significant**

The proposed Project does not include a residential element. Therefore, it would not result in a substantial addition of population to the ICSO area and would not require new or altered police facilities. Based on the large size of the patrol area, emergency response times can vary in the County, with rural locations taking a longer time to access. Nevertheless, there would be a modest increase in demand for police services over existing conditions. The proposed Project would employ the following staff: one plant manager, one O&M manager, a facility manager, and staff technicians with at least one additional technician for every 250 MW generation. In total, approximately 20 employees would be required to operate the proposed Project. An eight-foot barbed wired-topped fence would be installed on the outside perimeter of the proposed Project site. The substations proposed on the Project site would also have fences surrounding the perimeters. At the front gate, a camera-equipped call button would be monitored from the Project O&M building. At various points throughout the site, security cameras would be installed to monitor all areas of

the Project site. During the construction of each phase, an on-site security guard would be present between dusk and dawn and during the hours of non-active construction.

New development projects in the County would be required to pay an impact fee, which is imposed to County Ordinance 1418 Section 2 (2006). Similar to fire protection services, development fees for non-residential uses would be assessed based on the project size and demand for services. With the payment of fees and on-site security features, the proposed Project would not cause a substantial increase in the demand for police protection services. Therefore, impacts would be less than significant, and no further analysis of this topic is required in the EIR.

**iii. Schools?**

**Finding: Less Than Significant Impact**

The proposed Project is limited to a utility-scale battery energy storage complex that does not include a population element that would increase the demand for school facilities. Permanent employees (approximately 20) at the Project site would most likely come from the surrounding communities with children already attending neighborhood schools. Furthermore, 20 employees would not generate a significant amount of school aged children. The proposed Project would not result in a significant enrollment demand to surrounding schools. Therefore, the proposed Project would have a less than significant impact to schools, and no further analysis of this topic is required in the EIR.

**iv. Parks?**

**Finding: Less Than Significant Impact**

The proposed Project would not result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, such as parks. There would be no increase in residential population size; however, Project employees and visitors may elect to use recreational facilities and outdoor areas on the Project vicinity. Considering the relatively small number of employees that would be employed by the Project, the increase in demand for parks as a result of the proposed Project would be minimal. Therefore, impacts to parks would be less than significant, and no further analysis of this topic is required in the EIR.

**v. Other Public Facilities – Libraries?**

**Finding: Less Than Significant Impact**

The proposed Project would not result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, such as libraries. An increase in demand for library use is mostly associated with an increase in residential population, and the Project does not include any residential uses. Project employees and visitors may elect to visit a public library, and they go to the County Free Library in Heber without significantly impacting its ability to serve the community. Therefore, impacts to libraries would be less than significant, and no further analysis of this topic is required in the EIR.

### 3.17 RECREATION

RECREATION Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less than Significant Impact	No Impact
a) Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

#### 3.17.1 Environmental Setting

The multitude of geographical features and characteristics of the Imperial County allows for an abundance of a variety of recreational opportunities. Parks within the unincorporated of the County, such as Mount Signal, are classified by the following park types: Limited Facility Park, Neighborhood Park, Community Park, Regional Park, and State and Federal Parks.

Limited Facility Parks have minimal amenities. These parks serve one primary function with some possible accessory uses. This type of park may be of any size and is usually located in the open desert areas of the County. Including marinas, boat launching areas, and trailheads, the County has three Limited Facility Parks. These parks are the Palo Verde Park, Osborne Park, and Niland Marina (Imperial 2008b). Neighborhood Parks are usually small and located within the boundaries of an unincorporated community. Usually within walking distance, Neighborhood Parks are within residential district and easily accessible by pedestrians (Imperial 2008b). Also referred to as Pocket Parks, Neighborhood Parks typically consist of playground or other active uses, landscaped areas for passive uses, and areas for leisure use such as walking and sitting. Within the unincorporated areas of the County, two privately maintained, Neighborhood Parks are located in Heber and one located in Salton City, Martin Flora Park (Imperial 2008b). Community Parks are larger than Neighborhood Parks and are shared by the entire community. Distinguished by its major active recreational use, Community Parks often have a variety of athletic fields or courts. Numerous on-site facilities are present including, but not limited to; on-site parking facilities, large picnic areas, baseball fields, and basketball courts (Imperial 2008b). Community Parks are accessible by pedestrians or by vehicles. The County has four Community Parks: one in Ocotillo, one in Heber, Salton City Park, and Desert Shores Park (Imperial 2008b).

Regional Parks are found outside or inside a community. Access is typically provided by a main road and is shared by the entire population of the County. Like Community Parks, Regional Parks include sports fields and leisure areas, however they are distinguished by the presence of a water feature such as a lake or pond. Regional Parks are typically accessed by vehicle, but pedestrian access is available as well. The County has five Regional Parks: Sunbeam Lake, Wiest Lake, Heber Dunes, Red Hill Marina, and Pioneer's County Park (Imperial 2008b).

The final park types as set forth in the Parks and Recreation Element of the County's General Plan is state and federal Parks. These parks are maintained by the state or federal government. Typically, on large pieces of land (>100 acres), these parks have designated wildlife preserves and areas for human use (Imperial 2008b). State and federal parks welcome visitors inside and outside the County. Designated humans use of state and federal parks include hiking trails, camping areas, and off highway vehicle (OHV) areas. Access to these areas is typically provided by vehicle. The following is a list of state and federal parks in the County:

- Salton Sea State Recreation Area, located on the northeastern shore of the Salton Sea off SR-111,
- Pichaco State Recreation Area, located along the Colorado River north of Winterhaven,
- Anza Borrego Desert State Park and Ocotillo State Vehicular Recreation Area, adjoining parks located in the western open desert area of the County,
- Imperial Sand Dunes Recreation and Wilderness Area, located in about 40 miles of the open desert in the eastern portion of the County

The proposed Project would utilize a small portion of BLM land approximately 0.35 mile to the southwest of the Project site. This land is not a part of the Jacumba Wilderness area and is designated as recreational use (BLM 2020). The nearest recreational area for public use is the Rio Bend RV and Golf Resort, which is located approximately 2.95 miles to the northwest of the proposed Project.

### 3.17.2 Environmental Impact Analysis

- a) **Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?**

**Finding: Less than Significant Impact**

The proposed Project would utilize a population of approximately 270 construction personnel to complete the required tasks. The proposed Project is limited to a battery energy storage facility and does not include a component that would result in population growth of increased demand for recreational facilities. The proposed Project is not anticipated to increase the use of existing neighborhood, community, regional, state or federal parks and facilities nor would substantial deterioration of the parks or facilities be accelerated. Therefore, a less than significant impact would occur, and no further analysis of this topic is required in the EIR.

- b) **Would the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?**

**Finding: No Impact**

The proposed Project is limited to a battery energy storage facility and does not include recreational facilities or require the construction or expansion of recreational facilities. Therefore, no impacts would occur, and no further analysis of this topic is required in the EIR.

### 3.18 TRANSPORTATION

TRANSPORTATION Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less than Significant Impact	No Impact
a) Conflict with a program plan, ordinance, or policy addressing the circulation systems, including transit, roadway, bicycle and pedestrian facilities?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
b) Conflict with or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b)?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersection(s) or incompatible uses (e.g. farm equipment))?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Result in inadequate emergency access?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

#### 3.18.1 Environmental Setting

The network of highways and transportation circulation is planned to accommodate a pattern of concentrated and coordinated growth, providing both regional and local interconnection systems between communities and their neighboring areas. The County has established the following policies to aid guidance for future county plans:

- Coordinate the transportation and circulation with planned land uses;
- Promote the safe and efficient transport of goods and the safe and effective movement of all segments of the population;
- Make efficient use of existing transportation, transmission, and other infrastructure facilities, and
- Protect environmental quality and promote the wise and equitable use of economic and natural resources (Imperial 2008a).

The Imperial County Roadway Classification system classifies roadways using a functional classification process which entails the grouping of roads and highways into classes or systems according to the type of service they are intended to provide. Having a road classification system is necessary in order to determine how different travel can be channelized within the County in an organized system (Imperial 2008a). The different, classified roadway systems in the County include Expressway, Prime Arterial, Minor Arterial, Major Collector, Minor/Local Collector, Residential Street, Major Industrial Collector, and Industrial Local Street. Table 9 describes the Level of Service (LOS) for the previously mentioned roadway classifications.

**Table 9: Imperial County Standard Street Classification Average Daily Vehicle Trips**

Road	Level of Service (LOS)				
Class	A	B	C	D	E
Expressway	30,000	42,000	60,000	70,000	80,000
Prime Arterial	22,200	37,000	44,600	50,000	57,000
Minor Arterial	14,800	24,700	29,600	33,400	37,000
Major Collector	13,700	22,800	27,400	30,800	34,200
Minor Collector	1,900	4,100	7,100	10,900	16,200
Local County	*	*	<1,500	*	*
Major Industrial	5,000	10,000	14,000	17,000	20,000
Industrial Local	2,500	5,000	7,000	8,500	10,000
Source: Imperial 2008a * Levels of Service are not applied to the residential streets since their primary purpose is to serve abutting lots, not carry through traffic. Levels of Service normally apply to roads carrying through traffic between major trip generators and attractors.					

Materials and construction personnel will utilize various routes of transportation to and from the Project site. As described in Section 2.0, Project Description, to access the southern portion of the Project site, travel would have to occur along SR-98, and then proceeding 5.2 miles north to the Project site. To access the northern portion of the Project site, travel would occur along I-8 and the proceeding 4.6 miles to the south. SR-98 is classified as an expressway while Drew Road is classified as Minor Collector roadway and Wixom Road is unclassified (Imperial 2008a).

As a part of the pre-application material prepared by the Applicant, a Transportation Impact Analysis (TIA) was prepared for the proposed Project by Linscott, Law & Greenspan, Engineers on July 22, 2019. The TIA was conducted in accordance of Objective 1.2 of the Circulation and Scenic Highway Element of the County's General Plan (Imperial 2008a). This analysis used a LOS range from A to F, with LOS A representing the best and LOS F representing the worst operating conditions, to denote the different operating conditions which occur on the given roadway segments under various traffic volume loads. In March 2019, traffic counts were conducted during peak hours of 7:00 AM to 9:00 AM and 4:00PM to 6:00 PM.

The proposed Project would generate traffic during the initial construction period and during the utility-scale energy storage facility. During the initial construction period which would consist of the of the construction of the access road and the bridge across the Westside Main Canal, a total of approximately 8 workers per day would require travel to the Project site. During the secondary construction phase, it is approximated a maximum of 200 workers and 30 trucks per day will require travel to the Project site. With the addition of

Project-related travel, the average daily trips (ADT) for Drew Road increase from existing operations at LOS A and 541 ADT, to LOS B and 1,113 ADT. For Wixom Road, existing operations increase from LOS A and 89 ADT, to LOS A and 643 ADT. The TIA concluded, based on the significance criteria of the County and Caltrans, that both roadway segments are calculated to operate as LOS B or better (Linscott et. al 2019).

### **3.18.2 Environmental Impact Analysis**

- a) Would the project conflict with a program plan, ordinance, or policy addressing the circulation systems, including transit, roadway, bicycle and pedestrian facilities?**

**Finding: Less than Significant**

As described above, a TIA was prepared in accordance with Objective 1.2 of the County's Circulation and Scenic Highways Element of the General Plan. Traffic in the areas of Wixom Road and Drew Road are expected to increase by with the addition of construction-related traffic during the proposed Project time frame. Although an increase is expected, the increase in Project-related traffic is still considered lower than the County's thresholds of significance as operating at LOS B or better. Therefore, a less than significant impact would occur, and no further analysis of this topic is required in the EIR.

- b) Would the project conflict with or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b)?**

**Finding: Less Than Significant Impact**

During the construction phase, at peak construction (battery installation and connection phase), the proposed Project is anticipated to generate a total of 30 trip ends per day. It is estimated that the impacts of this operational traffic would be very small (up to 20 employees). The Project is not expected to create significant impacts at study intersections or study segments. All study intersections and segments were found to operate at LOS B or better for all the traffic scenarios analyzed. Therefore, impacts would be less than significant, and no further analysis of this topic is required in the EIR.

- c) Would the project substantially increase hazards to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?**

**Finding: No Impact**

Based on the proposed Project's location in a rural portion of the County with low traffic volumes, the Project would not increase hazards due to a geometric design or an incompatible use with surrounding agricultural land. Therefore, no impact would occur in association with hazards due to a design feature or incompatible uses, and no further analysis of this topic is required in the EIR.

**d) Would the project result in inadequate emergency access?**

**Finding: Less than Significant Impact**

The proposed Project is the construction of a utility-scale battery storage facility. Prior to Project operation, vehicular access would need to be established. A proposed bridge over the Westside Main Canal would provide access to the Project site from the north. Access roads are to be paved on the north and south sides of the Canal providing access. Approximately 60 feet of frontage road on the north Project fence and south of the IID maintenance road would be used for public access to the site. However, until the bridge construction is complete, temporary access is proposed from south of the Project site at SR-98 to Drew Road, or from north of the Project site at I-8 to Wixom Road. Temporary and permanent access ensures that adequate access will consistently be provided during construction and operation of the proposed Project. Therefore, impacts are considered less than significant, and no further analysis of this topic is required in the EIR.

### 3.19 TRIBAL CULTURAL RESOURCES

TRIBAL CULTURAL RESOURCES Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less than Significant Impact	No Impact
a) Would the Project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:				
i. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
ii. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

#### 3.19.1 Environmental Setting

The County will use the CEQA process to conserve tribal cultural resources and conform to Senate Bill 18 "Consultation with Tribal Governments" and Assembly Bill (AB) 52 "Consultation with Tribal Governments." Public awareness of cultural heritage will be stressed. All information and artifacts recovered in this process will be stored in an appropriate institution and made available for public exhibit and scientific review.

#### 3.19.2 Environmental Impact Analysis

- a) **Would the Project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:**
- i. **Listed or eligible for listing in the CRHR, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or**
  - ii. **A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?**

**Finding: Potentially Significant Impact**

The County, as the CEQA Lead Agency, will consult with appropriate tribes with the potential for interest in the region. Based on this consultation, it will be identified if the proposed Project site is located in an area having the potential for tribal cultural resources. Senate Bill 18 states: *“Prior to the adoption or any amendment of a general plan or specific plan, a local government must notify the appropriate tribes (on the contact list maintained by the NAHC) of the opportunity to conduct consultations for the purpose of preserving, or mitigating impacts to, cultural places located on land within the local government’s jurisdiction that is affected by the proposed plan adoption or amendment. Tribes have 90 days from the date on which they receive notification to request consultation, unless a shorter timeframe has been agreed to by the tribe.”*

The County will conduct outreach to Native American Tribes and receive requests for consultation through its AB 52 and SB 19 Native American outreach efforts. Therefore, until this process is initiated, the proposed Project may have potentially significant impacts. The results of the consultation effort will be described in the EIR. As a result, this environmental resource area will be further analyzed in the EIR.

### 3.20 UTILITIES AND SERVICE SYSTEMS

UTILITIES AND SERVICE SYSTEMS Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less than Significant Impact	No Impact
a) Require or result in the relocation or construction of new or expanded water, wastewater treatment, or stormwater drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Have sufficient water supply available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Result in a determination by the wastewater treatment provider which serves or may serve the project that is has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

#### 3.20.1 Environmental Setting

##### 3.20.1.1 Wastewater

Wastewater service to the proposed Project is currently not available. Capacity for the Project would be provided via a new septic leach field located near the O&M building.

##### 3.20.1.2 Electric Power

IID is also the electric power service provider to the proposed Project. As discussed above in Section 2.5, the Project would interconnect with the IID Campo Verde 230 kV transmission line via a new collector substation to be installed as part of the Project. The Project's effects on energy resources is discussed further in Section 3.7, Energy. If energy services to the Project were disrupted, backup power facilities (on-site solar and backup diesel generation) would be used to maintain the battery's safe operating temperatures.

##### 3.20.1.3 Solid Waste

Solid waste disposal service to the proposed Project is provided by the Imperial County Department of Public Works (ICDPW). ICDPW operates nine separate landfills located throughout the County, as listed in

Table 10, Solid Waste Service. The closest landfill to the proposed Project site is Imperial Landfill, which is expected to service the proposed Project.

**Table 10: Solid Waste Service**

Landfill	Address	Distance	Units	Remaining Capacity	Remaining Capacity Date	Maximum Capacity
Imperial	1705 W Worthington Rd Imperial CA, 92251	8.04 miles	1	180,000 Cubic Yards	10/1/2012	1,936,000 cubic yards
Calexico	133 W Hwy 98 Calexico, CA 92231	10.6 miles	1	180,000 Cubic Yards	10/1/2012	1,936,000 cubic yards
Ocotillo*	1802 Shell Canyon Rd Ocotillo, CA 92259	16.75 miles	1	Closed	01/31/2004	--
Holtville*	2678 Whitlock Road Holtville, CA 92250	28.41 miles	1	Closed	04/01/2007	--
Niland	8450 Cuff Road Niland, CA 92257	37.74 miles	1	296,702 Cubic Yards	9/18/2017	318,637
Hot Spa	10466 Spa Road Niland, CA 92257	46.02 miles	1	55,767 Cubic Yards	2/11/2016	233,150
Salton City	935 W Highway 86 Salton City, CA 92275	51.94 miles	1	1,264,170 Cubic Yards	9/30/2018	65,100,000 Cubic Yards
Picacho*	1409 Picacho Road Bard, CA 92222	64.14 miles	1	Closed	11/30/2011	--
Palo Verde*	589 Stallard Road Palo Verde CA, 92266	72.02 miles	1	Closed	10/1/2006	--

\*Closed and no longer receiving waste

Source: ICDPW 2020

### 3.20.1.4 Water

Potable water service to the Project site would be provided by the IID. IID manages over 3,000 miles of canals and drains, serving over one million acres within the County. IID services as a raw water wholesaler, selling untreated Colorado River Water to seven cities and two special districts, who then treat it and

distribute it to their users. As the IID water is untreated, the Project would include the installation and operation of an on-site water treatment plant to ensure that water was of sufficient quality for operations and personnel safety.

Water service to the proposed Project site would be provided via a new connection to the Canal. The Applicant requested a formal Will Serve letter from the IID Water Manager, in February 2020. The Applicant has requested a Water Supply Assessment, pursuant to SB 610, to identify the water supply and water quality needs for the proposed Project.

#### **3.20.1.5 Stormwater Drainage**

As discussed above in Chapter 2, the proposed Project would include the installation of stormwater retention basins at strategic locations throughout the site. The retention basins would be sized in accordance with the County's Design Guidelines. This requires the basins to be able to retain at least 3 inches of rainfall across the entire Project site. The current basin design has a maximum depth of 5 feet with 4:1 side slopes and provides a retention volume of approximately 40.8 AF. The basins will be excavated out of and constructed using native soil. Retention basins may be added with each phase, such that the site might have different drainage areas contributing to each basin.

#### **3.20.1.6 Natural Gas Facilities**

Southern California Gas Company (SoCalGas) provides natural gas service to the County. There is no natural gas connection to the site, and none would be required for the Project. The proposed Project would not utilize any natural gas, and as a result, no new or expanded natural gas facilities or infrastructure are needed to serve the Project.

#### **3.20.1.7 Telecommunications Facilities**

The proposed Project would install fiber optic telecommunications cables to connect the proposed substation to the IV Substation, utilizing existing transmission lines. The length of this proposed fiber optic telecommunications cable route is approximately one-third of a mile.

### **3.20.2 Environmental Impact Analysis**

- a) Would the project require or result in the relocation or construction of new or expanded water, wastewater treatment, or stormwater drainage, electrical power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?**

#### **Finding: Potentially Significant**

The proposed Project would require and result in the relocation and construction of new and expanded water, wastewater, stormwater drainage, telecommunications, and electrical power facilities. The Project would not require the use of natural gas. The construction of these facilities has the potential to cause significant environmental effects; therefore, these impacts will be analyzed further in the EIR

- b) Would the project have sufficient water supply available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?**

**Finding: Potentially Significant Impact**

During construction, the Project proposes at least two temporary connections to the Canal for construction. Permanent water to serve the Project's water/fire suppression will come from the Canal. Following construction, service water will be supplied either by an on-site water treatment system drawing water from the Westside Main Canal or from deliveries from water suppliers. This service water is to be used for operations using on-site aboveground storage. The proposed Project has the potential to not have a sufficient water supply; therefore, these impacts will be analyzed further in the EIR.

- c) Would the project result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?**

**Finding: No Impact**

Wastewater generated during construction would be limited to that generated by construction personnel and would be accommodated by temporary portable toilets brought to staging areas for construction crews. These portable toilets would be maintained by a licensed sanitation contractor. The licensed contractor would dispose of the waste at an off-site location and in compliance with standards established by the Regional Water Quality Control Board. The wastewater disposal would utilize existing disposal facilities and infrastructure with available processing capacity.

Long-term O&M would not generate substantial amounts of wastewater. As discussed above in Chapter 2, the proposed Project does not have or require a connection to a wastewater treatment provider. The Project would install a septic leach field located near the O&M building and would seek the appropriate ministerial permits from the County for its construction. Therefore, the Project would not generate wastewater that could otherwise occupy capacity in addition to the providers existing commitments, and the Project's projected demand would be met via project design features. Therefore, no impact would occur, and no further analysis of this topic is required in the EIR.

- d) Would the project generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?**

**Finding: Less Than Significant Impact**

Construction of the proposed Project would result in the temporary generation of various waste materials, including wood, metal, soil, and vegetation. Sanitation waste (i.e., human-generated waste) would be disposed of in accordance with sanitation waste management practices. Any soil excavated could be distributed at construction areas, used to backfill excavations, or used for access roads near or within the rights-of-way for the gen-tie and communication lines. Any excess soil would be disposed of off-site at an appropriately licensed facility, such as the Imperial Landfill. Although waste from construction activities

would be sent to one or more landfills in the area, the amount is not anticipated to be enough to affect the permitted capacity of a landfill. The Imperial Landfill would be the closest disposal facility to the site, and currently, the remaining capacity of the landfill is approximately 91 percent (CalRecycle 2020d).

O&M activities would consist of routine maintenance and emergency work at the Project site. These activities would not generate solid waste in an amount that would significantly affect the permitted capacity of landfills in the area. Since local landfills are capable of serving Project construction, they would be able to accommodate the Project's solid waste disposal needs during operation. It is anticipated that during decommissioning, the proposed Project would either be recycled or be served by a landfill with sufficient permitted capacity to accommodate the proposed Project's solid waste disposal needs. Therefore, impacts would be less than significant, and no further analysis of this topic is required in the EIR.

**e) Would the project comply with federal, state, and local management and reduction statutes and regulations related to solid waste?**

**Finding: Less Than Significant Impact**

The Integrated Waste Management Act of 1989 (AB 939) requires all local and county governments to adopt a Source Reduction and Recycling Element to identify means of reducing the amount of solid waste sent to landfills. The County of Imperial has established recycling and resource recovery programs in accordance with the requirements of AB 939. During construction, soil from drilling or excavation would be screened and separated for use as backfill to the maximum extent possible. Other waste, such as packing crates, spare bolts, and other construction debris, would be hauled off-site for recycling when possible.

O&M activities associated with the proposed Project would not generate a significant amount of solid waste and would not affect the permitted capacity of landfills in the area. Impacts during decommissioning would be the same as impacts described during construction. The proposed Project would comply with federal, state, and local statutes and regulations related to solid waste. Therefore, impacts would be less than significant, and no further analysis of this topic is required in the EIR.

## 3.21 WILDFIRE

<b>WILDFIRE</b> <b>Would the project:</b>	<b>Potentially Significant Impact</b>	<b>Less Than Significant with Mitigation Incorporation</b>	<b>Less than Significant Impact</b>	<b>No Impact</b>
If located in or near state responsibility areas or lands classified as very high fire hazard severity zones;				
a) Substantially impair an adopted emergency response plan or emergency evacuation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines, or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

### 3.21.1 Environmental Setting

The proposed Project is located within the unincorporated Imperial County in an area mapped as a Local Responsibility Area (LRA) by CAL FIRE (Cal Fire, 2007a; 2007b). The lands adjacent to and surrounding the proposed Project are also mapped as LRAs or Federal Responsibility Areas (FRA's). Additionally, the proposed Project is not located in lands mapped as VHFHSZ. The nearest location mapped VHFHSZ is approximately 16.5 miles to the west of the proposed Project (CAL FIRE 2007b).

### 3.21.2 Environmental Impact Analysis

- a) **Would the project substantially impair an adopted emergency response plan or emergency evacuation plan?**
- b) **Would the project due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?**
- c) **Would the project require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines, or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?**

- d) Would the project expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?**

**a-d) Finding: No Impact**

In response to items 3.21.2 a) through d), the proposed Project does not meet the criteria for impact analysis under the above significance criteria.

Projects are subject to wildfire analysis when one of four conditions are fulfilled:

1. The Project is located in a State Responsibility Area.
2. The Project is located near a State Responsibility Area
3. The Project is located on lands classified as Very High Fire Hazard Severity Zones (VHFHSZ).
4. The Project is located near lands classified as VHFHSZ.

The proposed Project does not fulfil any of these four conditions. As discussed above, and illustrated in CalFire 2007a and 2007b, the proposed Project site is located within areas mapped either as LRA or FRA, with the nearest SRA lands located approximately 16.5 miles to the west of the Project. Additionally, the Project is not located on or near any lands classified as VHFHSZ. Therefore, under these significance thresholds, the proposed Project would not result in an impact adopted emergency response or evacuation plans, exacerbate wildfire risks, or expose people or structures to significant risks as a result of runoff, instability, or drainage changes. Therefore, no impact would occur, and no further analysis is required in the EIR.

### 3.22 MANDATORY FINDINGS OF SIGNIFICANCE

MANDATORY FINDINGS OF SIGNIFICANCE Would the project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less than Significant Impact	No Impact
a) Have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Have impacts that are individually limited, but cumulative considerable? ("Cumulative considerable" means that the incremental effects of a Project are considerable when viewed in connection with the effects of past Projects, the effects of other current Projects, and the effects of probable future Projects)?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

#### 3.22.1 Environmental Impact Analysis

- a) **Would the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?**

#### **Finding: Potentially Significant Impact**

As discussed above, the Project is not anticipated to significantly impact cultural resources, and therefore, it would not eliminate any important examples of the major periods of California history or prehistory. However, the proposed Project has the potential to significantly impact biological resources, including fish and wildlife species habitats, as well as plant and animal communities. As impacts to biological resources are potentially significant, this topic will be analyzed further in the EIR.

- b) **Would the project have impacts that are individually limited, but cumulative considerable? (“Cumulative considerable” means that the incremental effects of a Project are considerable when viewed in connection with the effects of past Projects, the effects of other current Projects, and the effects of probable future Projects)?**

**Finding: Potentially Significant Impact**

The proposed Project, in conjunction with other past, present, and reasonably foreseeable future related projects, has the potential to result in significant cumulative impacts when the independent impacts of the proposed Project and the impacts of related projects combine to create impacts greater than those of the proposed Project alone.

A list of the related projects or growth projections will be developed for the EIR. The potential for the proposed Project in conjunction with the related projects and their cumulative contributions to environmental impacts will be evaluated in the EIR.

The cumulative impacts addressed in the EIR will be the same as the individual resource areas which will be evaluated in the EIR, which will include the following:

- Aesthetics
- Agriculture and Forestry Resources
- Air Quality
- Biological Resources
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology
- Land Use
- Tribal Cultural Resources
- Utilities and Service Systems

The extent and significance of potential cumulative impacts resulting from the combined effects of the proposed Project plus other past, present and reasonably foreseeable future projects will be evaluated in the EIR.

The proposed Project would not result in a cumulatively considerable contribution or result in a less than cumulatively considerable contribution to the environmental resource areas to the following topics, which will not be further evaluated in the EIR:

- Cultural Resources
- Energy
- Mineral Resources
- Noise
- Population and Housing
- Public Services
- Recreation
- Transportation
- Wildfire

**c) Would the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?**

**Finding: Potentially Significant Impact**

Potentially significant impacts to the following resources may have the potential to cause substantial adverse effects on human beings:

- Aesthetics
- Air Quality
- Biological Resources
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Agriculture and Forestry Resources
- Hydrology
- Land Use
- Tribal Cultural Resources
- Utilities and Service Systems

Potential impacts to each of these resources will be analyzed further in the EIR.

May 14, 2020

Mr. David Black  
Planner IV  
Planning & Development Services Department  
County of Imperial  
801 Main Street  
El Centro, CA 92243

SUBJECT: CED Westside Canal Energy Storage Project; NOP of a Draft EIR,  
GPA19-0003, ZC19-0004 and CUP19-0015

Dear Mr. Black:

On April 13, 2020, the Imperial Irrigation District received from the Imperial County Planning & Development Services Dept. a request for agency comments on the Notice of Preparation of a Draft Environmental Impact Report, General Plan Amendment no. 19-0003, Zone Change no. 19-0004 and Conditional Use Permit no. 19-0015 for the CED Westside Canal Energy Storage Project. The applicant, CED Westside Canal Energy Storage, LLC; proposes to develop in phases, over a 10-year period, a battery storage facility with up to 2,000 MW of capacity in the Mount Signal area in unincorporated Imperial County, approximately 8 miles southwest of the city of El Centro, CA and approximately 5.3 miles north of the United States and Mexico border. The proposed project includes a 230kV loop-in substation and permanent vehicular access over a proposed bridge spanning the West Side Main Canal. The proposed loop-in substation would connect the project to the existing IID Campo Verde-Imperial Valley 230kV radial gen-tie line, which ultimately connects to Imperial Valley Substation. The 168-acre project site is composed of 148 acres owned by the applicant with the remainder owned by the BLM, IID and a private landowner.

The Imperial Irrigation District has reviewed the information and has the following comments:

### **General Comments**

1. For temporary and/or permanent electrical distribution-rated service for the project, the applicant should be advised to contact Ernie Benitez, IID Customer Project Development Planner, at (760) 482-3405 or e-mail Mr. Benitez at [eibenitez@IID.com](mailto:eibenitez@IID.com) to initiate the customer service application process. In addition to submitting a formal application (available for download at the IID website <http://www.iid.com/home/showdocument?id=12923>), the applicant will be required

to submit a complete set of approved plans (including CAD files), project construction schedule, estimated in-service date, electrical one-line diagram of facility, electrical loads, panel sizes and locations, and all the applicable fees, permits, easements and environmental compliance documentation pertaining to the provision of electrical service to the project. The applicant shall be responsible for all costs and mitigation measures related to providing electrical service to the project.

2. Please note that electrical capacity is limited in the project area. A distribution-rated circuit study will be required. Any improvements identified in the circuit study to serve the project's electrical loads shall be the financial responsibility of the applicant. Project may require a transmission backfeed agreement.
3. IID water facilities that may be impacted include Westside Main Canal, Fern Side Main Canal, Fern Canal, Dixie Drain No. 3, Dixie Drain No. 3A, and the Fig Drain.
4. IID drains will be impacted with project and site runoff flows and proposed storm water detention facilities drainage. To mitigate impacts, the project will require a comprehensive IID hydraulic drainage system analysis. IID's hydraulic drainage system analysis includes an associated drain impact fee.
5. IID's canal or drain banks may not be used to access the project site. Any abandonment of easements or facilities shall be approved by IID based on systems (irrigation, drainage, power, etc.) needs.
6. To insure there are no impacts to IID water facilities, the applicant should submit the project's plans (including but not limited to grading and drainage and fencing plans as well as the project's Storm Water Pollution Prevention Plan) to IID Water Department Engineering Services Section prior to final design. The IID WDES Section can be contacted at (760) 339-9265 for additional information.
7. To obtain water for construction, applicant should contact IID South End Division at (760) 482-9800.
8. New long-term non-agricultural water supply requests are processed under the district's Temporary Land Conversion Fallowing Policy (available at the IID website [www.iid.com/TLCFP](http://www.iid.com/TLCFP)). For additional information regarding water supply policies, contact Ms. Justina Gamboa-Arce at (760) 339-9085.
9. Per State of California Water Resources Control Board Division of Drinking Water, the battery storage project will need to have a contract with an approved provider to deliver the drinking water to the site.

10. Any construction or operation on IID property or within its existing and proposed right of way or easements including but not limited to: surface improvements such as proposed new streets, driveways, parking lots, landscape; and all water, sewer, storm water, or any other above ground or underground utilities; will require an encroachment permit, or encroachment agreement (depending on the circumstances). A copy of the IID encroachment permit application and instructions are available at the IID website <http://www.iid.com/departments/real-estate>. The IID Real Estate Section should be contacted at (760) 339-9239 for additional information regarding encroachment permits or agreements.
11. An IID encroachment permit is required to utilize existing surface-water drainpipe connections to drains, and receive drainage service from IID. Surface-water drainpipe connections are to be modified in accordance with IID Standards. A construction storm-water permit from the California Regional Water Quality Control Board is required before commencing construction. IID will require copies of this permit and of the project's Storm Water Pollution Prevention Plan.
12. In addition to IID's recorded easements, IID claims, at a minimum, a prescriptive right of way to the toe of slope of all existing canals and drains. Where space is limited and depending upon the specifics of adjacent modifications, the IID may claim additional secondary easements/prescriptive rights of ways to ensure operation and maintenance of IID's facilities can be maintained and are not impacted and if impacted mitigated. Thus, IID should be consulted prior to the installation of any facilities adjacent to IID's facilities. Certain conditions may be placed on adjacent facilities to mitigate or avoid impacts to IID's facilities
13. Any new, relocated, modified or reconstructed IID facilities required for and by the project (which can include but is not limited to electrical utility substations, electrical transmission and distribution lines, etc.) need to be included as part of the project's CEQA and/or NEPA documentation, environmental impact analysis and mitigation. Failure to do so will result in postponement of any construction and/or modification of IID facilities until such time as the environmental documentation is amended and environmental impacts are fully analyzed. **Any and all mitigation necessary as a result of the construction, relocation and/or upgrade of IID facilities is the responsibility of the project proponent.**
14. Dividing a project into two or more pieces and evaluating each piece in a separate environmental document (Piecemealing or Segmenting), rather than evaluating the whole of the project in one environmental document, is explicitly forbidden by CEQA, because dividing a project into a number of pieces would allow a Lead Agency to minimize the apparent environmental impacts of a project by evaluating individual pieces separately, each of which may have a less-than-significant impact on the environment, but which together may result in a significant impact. Segmenting a project may also hinder developing comprehensive mitigation

strategies. In general, if an activity or facility is necessary for the operation of a project, or necessary to achieve the project objectives, or a reasonably foreseeable consequence of approving the project, then it should be considered an integral project component that should be analyzed within the environmental analysis. The project description should include all project components, including those that will have to be approved by responsible agencies. The State CEQA Guidelines define a project under CEQA as "the whole of the action" that may result either directly or indirectly in physical changes to the environment. This broad definition is intended to provide the maximum protection of the environment. CEQA case law has established general principles on project segmentation for different project types. For a project requiring construction of offsite infrastructure, the offsite infrastructure must be included in the project description. *San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994) 27 Cal.App. 4th 713.

### Specific Comments

15. Figure 2 of the NOP and Figure 3 of the Initial Study show a conceptual site plan that is identified as subject to change. IID therefore clarifies that any proposed improvements and facilities in IID rights of way are also subject to IID review, permitting and approvals. Additionally, any proposed improvements outside IID right of way will be further reviewed for the purpose of safeguarding that any improvements such as roads, drainage basins, fencing, driveways, etc., do not pose an impact to IID's ability to operate and maintain district facilities.
16. Figure 2 of the IS depicts a project site aerial photo as being the project boundary. However, elsewhere in the document, reference is made to potential temporary site access using Westside Main Canal bank from State Hwy. 98 to the north, along the south canal bank. Shouldn't this potential temporary site access proposal need to be included in the environmental analysis?
17. Table 2, titled *Agency Permits and Environmental Review Requirements*, lists IID for a Generator Interconnection Agreement. Please be advised that the IID will also need to review the proposed detailed construction-level plans to determine impacts and will include review of electrical service, water service, drainage, and any encroachments within IID right of way. Encroachment permits and likely a formal Encroachment Agreement will be required. The agreement typically will document the permit items, any required project mitigations and associated fees. The table needs to add at a minimum, "Various Encroachment Permits".
18. Section 2.3 of the IS, titled *Project Components*, indicate 3 to 5 phases for full buildout. Construction of Phase 1 is mentioned to begin in 2021 and would include roads, a bridge and other facilities. IID is concerned with the roads, bridge and onsite development as well as any temporary access that could impact the Westside Main Canal. Between now and January 2021 is a very short period and

IID, as of yet, has not been provided any construction-level plans for review. Applicant should be advised of this predicament as well as the quandary that district staff will be in when any substantial submittals are received for review and IID is expected to complete a review in a short amount of time.

19. Section 2.3.2 of the IS, titled *Common Components*, references both retention and detention basins as being provided. Detention basins presume there is a location to meter out the storm water. Is the project entertaining both types of basins? Please advise where the basins will outlet to, and if an IID drain is intended to be the recipient of any storm water discharge. Any basins should be located and constructed so that they do not impact the integrity of the Westside Main Canal and its bank.
20. Section 2.3.2.1 of the IS, titled *Operations and Maintenance Facilities*, indicate a septic leach field will be located near the O&M building. IID would look to Imperial County Environmental Health Department to ensure the buffer distance from the Westside Main Canal is adequate to minimize any potential of effluent transmission to the Westside Main Canal.
21. Section 2.3.2.2 of the IS, titled *Water Connections*, indicate that both temporary construction water and permanent water will be needed from the IID's Westside Main Canal. Westside Main Canal Delivery 6 has historically serviced the southern project parcel. However, if this service gate is not adequate, then the project will need to apply for a new service. This section also indicates that a connection to the Westside Main Canal would be constructed by a horizontal directional drilled underground boring, which isn't the case. IID will not allow applicant's contractor to perform this work in IID right of way. The CED Westside Canal Energy Storage Project is considered by IID a customer service project, where CED Westside Canal Energy Storage, LLC, as customer, would need to complete an application and pay the cost of the design and construction of the new water service, if the existing Westside Main Canal Delivery 6 is not adequate.

Additional Clarification:

- Temporary construction water can be obtained with a pump set up, an IID encroachment permit and an application to IID South End Division.
- Permanent water will also require IID encroachment permit and application to IID South End Division. However, it will also require an IID water supply agreement, a formal request for a new water delivery and payment for a new water delivery. IID will then design and construct the delivery in the Westside Main Canal along with pipe to the Westside Main Canal right of way line. At that point, the applicant can connect to the underground pipe.

- Any connection to IID's facility for water can only be performed by IID as the system is live 24/7 and the connection can only be scheduled with a low water level in the Westside Main Canal. It is suggested that the applicant start the process sooner than later.
- For both temporary and permanent water delivery/service, metering is required by IID.

22. Section 2.3.2.3 of the IS, titled *Stormwater Retention*, mentions that storm water retention basins will be constructed. Are these retention basins or detention basins as described in Section 2.3.2, titled *Common Components*?

Additional Clarification:

- If the project is entertaining a detention basin, then the basin would need to discharge to an existing drain. New drains crossing the Westside Main Canal will not be considered by IID.
- It is stated that at least 3 inches of rainfall across the entire site would be retained. IID is concerned that the basins will retain and not have an outlet. IID is requesting that the basins be designed for 5 inches (for a storm track) and not the 3 inches of precipitation over the site (for an individual storm). The concept of the 5-inch storm track was promoted for many years by the County of Imperial as a result of the late 1970s tropical storms Kathleen and Doreen that inundated Imperial County. Additionally, the hydrology study for the site should consider any other contributing area such as desert washes that may impinge on the project to assure there is no offsite drainage being routed onto the project site; otherwise, the site may need to consider additional retention volumes.

23. Section 2.3.2.4 of the IS, titled *Permanent Vehicle Access – Public Access Roads*, mentions that the applicant is proposing to construct public access roads on both the north and south side of the Westside Main Canal along with a clear-span bridge off the Westside Main Canal. Reference is made to Figures 4 and 5 of the IS, which show layout of access roads, bridge and an elevation profile of the bridge.

Additional Clarification:

- The depictions in both Figure 4 and 5 and the actual layout and elevation profiles have not been approved or reviewed by IID.
- More detail and clarity needs to be provided relative to the temporary access options. It is not clear if these include both south and north side of the Westside Main Canal banks, or rights of way.
- IID requires a cross section of the proposed public road access improvements in relation to the Westside Main Canal banks, with elevations

and dimensions, to carefully review and ensure there are no conflicts with the district's O&M operations. IID typically claims a minimum of either prescriptive or deeded right of way, whichever is greater to assure its ability to clean the canal as regular maintenance.

- IID suggests that the County of Imperial and the applicant review the need for a public road versus a private one for landowner access and public emergency access as opposed to full public use. This would also include the bridge crossing.
- Applicant will need to apply for encroachments for the bridge, construction access and for the public access road. Applicant should be advised that IID requires an encroachment permit and/or agreement for any encroachment across, over, under and/or parallel to district facilities.
- The bridge is clearly one of the major impacts to IID facilities. It is of the utmost importance for the applicant to start the formal plan submittal and permitting process with IID as soon as possible. Potential impacts to IID facilities requires a formal review by the district, otherwise, it will cause delays to the project's proposed schedule.
- IID typically claims prescriptive or deeded right of way, whichever covers more distance. Additionally, per the California Water Code, IID also claims additional right of way beyond the prescriptive/deeded, in order to conduct adequate maintenance of district facilities. This must be considered in the project's construction plan development.
- Due to the importance of the Westside Main Canal and concerns outlined herein, IID would look at a sufficient area between the Westside Main Canal and the access road so that the maintenance operations of one does not impact the other. Whether the access road is public or private, these O&M impacts to each other must be considered in the design process.

24. Section 2.3.2.7 of the IS titled *Fire Protection/Fire Suppression*.

Additional Clarification:

- Project site grading should address fire suppression flows and insure the integrity of the Westside Main Canal. The observation that water for fire suppression will be obtained by tapping into the Westside Main Canal shows a lack of understanding of how water can be obtained from IID. No "tapping" of the Westside Main Canal shall be permitted. Nevertheless, water can be obtained in accordance with IID policies. See item no. 21 for additional clarification.
- An explanation is needed on whether open storage basins for fire suppression water will be used or if all water storage is proposed with enclosed storage tanks. If open basins are used, such basin capacity shall include maximum amount of water for fire suppression plus a contingency

(20% suggested) for freeboard. Because of the regional importance of the Westside Main Canal and as a worst-case scenario, this is in addition to calculated storm water flows. These additional amounts are considered necessary in the event that the basin is full but the water is not easily accessible and/or sufficient to use for fire suppression.

25. Section 2.6 of the IS, titled *Existing and Proposed Utility Easements*. It bears repeating that applicant should be advised that any new facilities placed over/under and/or parallel to IID facilities will need to be reviewed and approved as part of the IID planning review and encroachment permitting process. For example, typically, there are minimum height clearances over the canal banks to any overhead power/cable lines. This is to ensure no impact to IID's ability to maintain its water and/or drain infrastructure.

Additional Clarification:

- If applicant is entertaining the upgrade of existing IID electrical facilities (S Line & Circuit L76) for interconnection purposes or to provide service to the project, then the electrical upgrade drawings need to be forwarded to IID's Water Department as well as the district's Energy Department to review for compliance with the departments' standards/requirements.
26. Section 2.10 of the IS, titled *Discretionary Actions*, calls for an IID Water Supply Assessment. However, there is no mention of an IID encroachment permit, and likely an encroachment agreement for any work to be placed in, over or under IID Water Department facilities, including any impact mitigations. Mitigations may not be environmental, but due to impacts determined after a detailed review of the construction-level plans to be provided for the IID's planning review, when such plans are available from the Applicant.
27. Section 3.8.2 of the IS, titled *Geology and Soils - Environmental Impact Analysis*. The project site's high potential for expansive soils, unsuitable for backfill for structure foundations, retaining walls or pipe bedding along with reference to IS figures 4 & 5 (retaining wall), is of concern to IID. Work on the Westside Main Canal bank is restricted and typically not allowed to outside entities. A water outage is not possible. Any work on the Westside Main Canal bank would imply strict requirements, conditions and supervision. The structural integrity of the Westside Main Canal is of utmost concern to IID.
28. Section 3.11 of the IS, titled *Hydrology and Water Quality*, indicates that subsections a) and c) are both "Potentially Significant Impact". It is requested that the comments provided herein related to storm drainage and retention basins be considered in the EIR document when it is prepared. The key issues of concern are whether the onsite storm water basins are retaining or detaining, if and where

they discharge to, capacity sufficient to meet a 5-inch storm track as opposed to a 3-inch precipitation event and location of basins to not impact the integrity of the Westside Main Canal or canal bank. Furthermore, section should indicate that project grading shall be sloped away from the Westside Main Canal.

29. Section 3.18 of the IS, titled *Transportation*, indicates all four categories as either "Less than Significant" or "No Impact". The IID takes no exception to this if the transportation being discussed and reviewed in the document is for public traffic using existing public roads. The issue that IID does take exception to is if the document is also referencing traffic on the Westside Main Canal bank as a means of temporary access for construction. If this is the case, then IID would suggest the finding under "c) Would the project substantially increase hazards to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?" and d) Would the project result in inadequate emergency access?" both be marked as "Less than Significant Impact with Mitigation Incorporation". The mitigation could be that the applicant will apply for an IID encroachment permit and comply with the conditions of the permit. The concerns by IID of construction and public traffic include the conditions of the canal bank soils, structural strength, nearness to the water, traffic speed, traffic safety, traffic control, coexistence with IID O&M activities and potential conflicts, adequate bank width and all weather surfacing (or lack thereof), dust and erosion control. If there are several alternatives for temporary access, they should all be clearly indicated in the IS, not only in this section, but also in the project description.
30. Section 3.20 of the IS, titled *Utilities and Service Systems*, indicates the following: Potable water service to the project site would be provided by the IID". This is not correct. IID only provides raw canal water, not potable water. Please also see IID comments under item no. 21. In addition, water provided from IID facilities for project construction is restricted to metered pump(s). On the matter of stormwater drainage, please see IID comments under item no. 22.

As with any other development project, IID will need to perform a comprehensive planning review of the project to determine detailed impacts as soon as construction-level plans are available. The above comments however should clarify IID's concerns. It is important that County of Imperial, prior to approving any grading plans or improvement plans for construction, communicate and collaborate with IID in the plan checking process to ensure that the applicant/developer understands that both agencies have a responsibility and accountability in the final approval of the construction documents and before construction begins so that any unnecessary delays can be prevented.

Should you have any questions, please do not hesitate to contact me at 760-482-3609 or at [dvargas@iid.com](mailto:dvargas@iid.com). Thank you for the opportunity to comment on this matter.

Respectfully,

A handwritten signature in black ink, appearing to read 'Donald Vargas', with a large, stylized flourish at the end.

Westside Canal Storage Battery Project  
NOP/IS SCH #2020040122

Mr. David Black, Planner  
County of Imperial Planning and Development Services  
801 Main Street  
El Centro, CA 92243

Dear Mr. Black:

Thank you for including the California Department of Transportation (Caltrans) in the Notice of Preparation / Initial Study (NOP/IS) (SCH #2020040122) review process for the Westside Canal Storage Battery project located near Interstate 8 (I-8) and State Route 98 (SR-98). The mission of Caltrans is to provide a safe, sustainable, integrated and efficient transportation system to enhance California's economy and livability. The Local Development-Intergovernmental Review (LD-IGR) Program reviews land use projects and plans to ensure consistency with our mission and state planning priorities.

Caltrans has the following comments:

**Traffic Control Plan/Hauling**

The California Department of Transportation (Caltrans) has discretionary authority with respect to highways under its jurisdiction and may, upon application and if good cause appears, issue a special permit to operate or move a vehicle or combination of vehicles or special mobile equipment of a size or weight of vehicle or load exceeding the maximum limitations specified in the California Vehicle Code. The Caltrans Transportation Permits Issuance Branch is responsible for the issuance of these special transportation permits for oversize/overweight vehicles on the State Highway System. Additional information is provided online at:

<http://www.dot.ca.gov/trafficops/permits/index.html>

Mr. David Black  
May 18, 2020  
Page 2

A Traffic Control Plan is to be submitted to Caltrans District 11, including the interchange at I-8/ Westside Road, at least 30 days prior to the start of any construction. Traffic shall not be unreasonably delayed. The plan shall also outline suggested detours to use during closures, including routes and signage.

Potential impacts to the highway facilities (I-8 and SR-98) and traveling public from the detour, demolition and other construction activities should be discussed and addressed before work begins.

If you have any questions, please contact Mark McCumsey, of the Caltrans Development Review Branch, at (619) 688-6802 or by e-mail sent to [mark.mccumsey@dot.ca.gov](mailto:mark.mccumsey@dot.ca.gov).

Sincerely,

El Centro, CA 92243

SUBJECT: Initial Study for General Plan Amendment 19-0003, Zone Change 19-0004,  
Conditional Use Permit 19-0015

Dear Mr. Minnick:

The Imperial County Air Pollution Control District ("Air District") would like to thank you for the opportunity to review and comment on the Initial Study (IS) for General Plan Amendment (GPA), Zone Change (ZC) 19-0004, and Conditional Use Permit (CUP) 19-0015 regarding the proposed Westside Canal Battery Storage Project ("Project") submitted by Consolidated Edison Development (CED; aka "Applicant"). The proposed Project will be located in the general vicinity of Mandrapa Road and Liebert Road, also identified as Assessor Parcel Numbers (APNs) 051-350-009, -010, -011, -018, and -019.

Upon review, the Air District understands that the IS has determined that the proposed Project will result in potentially significant environmental impacts, and an Environmental Impact Report (EIR) has been deemed appropriate to evaluate the proposed Project. Therefore, the Air District would like to reserve comments until it reviews the EIR. Solar projects can create significant cumulative emissions of PM<sub>10</sub> both during construction and operation. To gain insight on what the Air District expects from an Air Quality Analysis and general air quality mitigation measures, the applicant can review the Imperial County California Environmental Quality Act (CEQA) Handbook (ed. 2017). Section 6—Air Quality Analysis describes essential components of a sound Air Quality Analysis. Section 7—Mitigation Measures discusses Regulation VIII fugitive dust (PM<sub>10</sub>) which governs standard mitigation measures for the control of fugitive dust. As construction

activities can generate significant emissions of NO<sub>x</sub> from equipment, the Air District recommends that a CalEEMod (California Emissions Estimator Model) be used to determine the threshold of NO<sub>x</sub> emissions from construction equipment. Section 5.1—Motor Vehicle Emissions discusses its use to model various emissions of vehicle emissions associated with land use projects.

The Air District looks forward to reviewing the Air Quality Analysis as part of the EIR. If the applicant has any questions please call our office at (442) 265-1800.

Sincerely,

Curtis Blondell  
Environmental Coordinator

Hey David good morning

Just wanted to request a one day extension for the submittal of comments for the GPA 19-0003, ZC 19-0004, CUP 19-0015. My review of Curtis' letter took longer than I anticipated. Sorry of the delay

You o.k. with us submitting on the 19<sup>th</sup>?

Good Afternoon

Imperial County Fire Department would like to request some additional time to provide comments for this project due to the Covid-19 situation. ICFD would like to be able to fully review the submitted information with department chief staff. Again ICFD is requesting further time for review and comments and is greatly appreciated if possible.

Thank You

**CAUTION: This email originated outside our organization; please use caution.**

Hi Gabriela,

Please forward my comments to David Black, Planner IV on these two projects:

**Assessment #19-0018: Applicant: (CED) Con Edison Clean Energy Businesses**

We request that prior to the start of business operations that the facility informs the DTSC Imperial CUPA of their operations and whether they will have hazardous materials, hazardous waste, underground storage tanks, aboveground storage tanks, or be a CalARP facility. If so, they are not allowed to operate without a permit.

**Assessment # 19-0020: Applicant: Second Imperial Geothermal**

We require the facility to update their CERS account information with the modifications made at their facility. This must be done within 30 days of the modification.

## Executive Summary

This Visual Resources Impact Assessment evaluates potential impacts associated with the Westside Canal Battery Storage Project (project) per the applicable California Environmental Quality Act thresholds. A summary of the results is presented below.

1. **The project would not have a substantial adverse effect on a scenic vista.** The composition of views from areas and roadways surrounding the project would change as a result of the project however, no designated scenic vistas are identified in the Imperial County General Plan for the area, so **this Guideline is not applicable.**
2. **The project would not substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings, within a state scenic highway.** The project site is not visible from a designated Scenic Highway, nor from a route considered eligible for designation, so **this Guideline is not applicable.**
3. **The project would not substantially degrade the existing visual character or quality of the site and its surroundings.** The project would convert existing agricultural lands to a battery energy storage complex by replacing vegetation, and disturbed land with man-made elements including lithium-ion battery and/or flow battery energy storage facilities, a behind-the-meter solar energy facility to serve auxiliary power needs, a new on-site 230 kilovolt (kV) loop-in switching station, a 34.5 kV to 230 kV substation, underground electrical cables and other support equipment and structures, and permanent vehicular access to and from the site over a proposed bridge spanning Imperial Irrigation District's (IID's) Westside Main Canal. As viewed from surrounding areas and roadways, the project would largely be consistent with the existing visual character of the area, relating to similar elements in view. As a result, changes to the visual environment would not substantially degrade the existing visual character or quality of the site and its surroundings and the **visual impacts would therefore be insignificant. Short term construction related impacts would be less than significant.**
4. **Light and glare impacts associated with the project are not considered to be significant.** For the behind-the-meter solar facility, the Project proposes to use non-reflective photovoltaic (PV) panels, roof top and/or ground-mounted, which are not anticipated to be a significant source of glare. In addition, the project's lighting system will be designed to provide the minimum illumination required for security and operations. It is therefore anticipated that no

substantial sources of light and glare will be created so **light and glare impacts would be less than significant.**

5. **The project would be consistent with applicable policies and planning documents.** The project has been designed to be consistent with zoning and General Plan policies related to renewable energy and transmission. **Upon approval of a General Plan Amendment and Rezone, the project will be consistent with applicable policies and planning documents.**
7. **The composition of the project viewshed would not be adversely affected by physical changes introduced by cumulative projects.** The project in conjunction with cumulatively considerable projects would be largely consistent with the existing visual character and quality of the area which currently supports heavy agriculture, large scale solar facilities, and other green energy projects. Therefore, **visual impacts associated with cumulatively considerable projects would be less than significant.**

## 1.0 Introduction

The following Visual Resources Impact Assessment was prepared for the proposed Westside Canal Battery Storage Project (project).

### 1.1 Purpose

This report evaluates visual resource impacts associated with the project, to determine their significance under the California Environmental Quality Act (CEQA).

### 1.2 Key Issues

Key issues to be examined are identified in State CEQA Guidelines, Appendix G, for determining significance. The issues are whether the proposed project would have a substantial adverse effect on a scenic vista, substantially damage scenic resources within a state scenic highway, substantially degrade the existing visual character or quality of the site and its surroundings, and/or create a new source of substantial light or glare.

### 1.3 Principal Viewpoints to be Covered

This study analyzes changes in the visual environment that will occur as a result of project implementation from the following locations: Interstate 8 (I-8), Drew Road (County Highway 29), local roadways, surrounding residences including the Rio Bend RV Park and Golf Course, and the Westside Elementary School.

### 1.3 Definitions and Terminology

The following terms and concepts are used in the discussion below to describe and assess the visual environment and anticipated impacts from the proposed project.

**Key Observation Point (KOP):** A point along a travel route or at a use area where the proposed project would be most visible.

**Scenic Vista:** An area that is designated, signed, and accessible to the public for the express purposes of viewing and sightseeing as designated by a federal, state, or local agency.

**Scenic Highway:** A section of public roadway that is designated as a scenic corridor by a federal, state, or local agency.

**Scenic Corridors:** Scenic corridors refer to any designated freeway, highway, road, street, boulevard, or other vehicular right-of-way that traverses an area of unusual scenic quality.

**Sensitive Viewpoints:** Views from a public park, recreational trails, and/or culturally important sites are considered to have a high visual sensitivity and are considered examples of sensitive viewpoints.

**Sensitive Receptors:** Areas subject to high visibility by many people are considered to be sensitive receptors. Residential viewers typically have extended viewing periods and are therefore generally considered to have high visual sensitivity.

**Viewshed:** The landscape that can be viewed free of obstruction under favorable atmospheric conditions from a viewpoint or along a transportation corridor.

**Visual Compatibility:** The degree to which development with specific visual characteristics is similar in character to its setting.

**Visual Character:** Formed by the order of the patterns composing it: the visual elements of these patterns are the form, line, color, and texture of the landscape's components: Their interrelationships can be described in terms of dominance, scale, diversity, and continuity.

**Visual Impact:** The degree of change in visual resources and viewer response to those resources caused by a development project.

**Visual Quality:** Visual quality is dependent upon the visual environment's brilliance, distinction, and/or excellence. The two most commonly used criteria to define visual quality are vividness and intactness/unity. A visual resource with a high degree of vividness and intactness/unity will typically have a high level of visual quality.

**Viewers' Response:** An individual's perception of a view and his/her enjoyment of a view.

## 2.0 Project Description

Consolidated Edison Development, Inc. (CED) is proposing to develop, design, construct, own, operate, and maintain the CED Westside Canal Battery Storage Project (project), a utility-scale energy storage complex with a capacity of up to 2,000 megawatts (MW). The project would store energy generation from the electrical grid, and optimally discharge that energy back into the grid as firm, reliable generation and/or grid services.

The project would be comprised of lithium-ion battery and/or flow battery energy storage facilities, a behind-the-meter solar energy facility, a new on-site 230 kilovolt (kV) loop-in switching station, a 34.5 kV to 230 kV substation, underground electrical cables, and permanent vehicular access to and from the site over a proposed bridge spanning IID's Westside Main Canal. The proposed loop-in switching station would connect the project to the existing IID Campo Verde-Imperial Valley 230 kV radial gen-tie line, which connects to the Imperial Valley Substation (IV Substation) and the California Independent System Operator (CAISO), approximately one-third mile south of the project site. CED has submitted the necessary Interconnection Request Applications to the CAISO and IID.

The project would complement both the existing operational renewable energy facilities, as well as those planned for future development in Imperial County (County), and would support the broader southern California bulk electric transmission system by serving as a firm, dispatchable resource.

The project is pursuing the following objectives:

- To receive grid energy during beneficial market and operational periods and store that energy for dispatch when the customer (i.e., a load-serving entity) deems it to be more valuable.
- To be a valuable resource in allowing the customer and system operators to manage the effect of intermittent renewable generation on the grid and create reliable, dispatchable generation upon demand.
- To utilize available land that has not been used for agricultural production for more than 15 years, and enhance the site location by providing for permanent vehicular access.

## **2.1 Project Location**

The project would be located in the unincorporated Mount Signal area of the County, approximately 8.0 miles southwest of the city of El Centro and approximately 5.3 miles north of the U.S.-Mexico border (see Regional Location Map, Figure 1). The project site is comprised of two parcels owned by CED, Assessor Parcel Number (APN) 051-350-010 and APN 051-350-011, totaling approximately 148 acres. These parcels have limited access corridors for vehicular traffic and are considered less desirable for agricultural production, as reflected by the last 15 years during which no farming activity has occurred.

The project site is approximately one-third mile north of the IV Substation and directly south of the intersection of Liebert Road and the IID's Westside Main Canal. The project site is bounded by the Westside Main Canal to the north, BLM lands to the south and west, and vacant private land to the east. The Campo Verde solar generation facility is located north of the project site, across the Westside Main Canal. The Vicinity Map, provided as Figure 2, shows an aerial view of the project site, the above-mentioned nearby facilities, and the key observation point locations.

The two project parcels are proposed for development as a utility-scale energy storage complex. The project would also utilize portions of two parcels located north of the Westside Main Canal (APN 051-350-019 owned by IID and APN 051-350-018 owned by a private landowner) for site access and as a temporary construction staging area. The project would also access a small portion of APN 051-350-009 within an IID easement for connection to the existing IID Campo Verde-Imperial Valley 230 kV radial gen-tie line during the construction of a switching station on the project site. The total proposed project development footprint, encompassing both temporary and permanent impacts, would be 163.32 acres.

## **2.2 Project Components**

The Site Plan, provided as Figure 3, shows the conceptual plan for the project with a representation of the various energy storage technologies, behind-the-meter ground- and roof-mounted solar, common facilities within the project site, and permanent vehicular access to the project site. The actual configuration of the project would depend on the size of individual phases and the type of battery technology deployed. Specific project components are described below.

### **2.2.1 PHASING AND SCHEDULE**

The project would be constructed in three to five phases over a 10-year period, with each phase ranging from approximately 25 MW up to 400 MW per phase. Depending on the size of the battery system for a given phase, construction and commissioning (approval to operate) is anticipated to take approximately 6 to 12 months. For the purposes of this analysis, the applicant has assumed that construction activities would last for approximately 32 months to complete the full project build-out.

Construction of the 100- to 200- MW first phase would include roads, a permanent clear-span bridge across the Westside Main Canal, the Operations and Maintenance (O&M) facilities, water connections and water-mains, storm water retention, switching station and project substation, legal permanent vehicle access, as well as the first energy storage facility. To access the project site, construction workers would travel along Interstate 8 (I-8) and head 4.6 miles south to the project site, and would utilize the IID Fern Check Bridge as a temporary pedestrian bridge until the permanent bridge is constructed. During peak construction activities, approximately 200 workers and approximately 30 daily deliveries would be required. If approved, it is anticipated that construction of the first phase would begin in 2021.

It is anticipated that each subsequent phase would be constructed within one to two years of each other, with the timing and size of each phase dependent on market conditions and the applicant's ability to secure commercial contracts with prospective customers. With the project being built in phases, the necessary infrastructure, such as water mains, retention ponds, and access roads, would be built out to serve the project phases from west to east and expanded over time to serve each phase. These subsequent phases would require improvements such as additional substation equipment, water main and site road extension, but would not require construction of additional common facilities which would be completed during the first phase. The total nameplate (or rated capacity) capacity of the project at full build-out (all phases completed) would be approximately 2,000 MW.

Construction activities during all project phases would only occur Monday through Friday, between the hours of 7:00 a.m. and 7:00 p.m. or Saturday between the hours of 9:00 a.m. and 5:00 p.m., excluding holidays, per County Ordinance.

## **2.2.2 COMMON COMPONENTS**

As shown on the site plan (Figure 3), the northwest area of the project serves as the location for the common facilities, which include the switching station and project substation and the O&M facilities. With the project being built in phases, the necessary infrastructure, such as water mains, retention ponds and access roads, would be built out to serve the project phases from west to east and expanded over time to serve each phase.

A summary of the common facilities is presented below:

- 230 kV loop-in switching station
  - Connection to Campo Verde Imperial Valley 230 kV radial transmission line
  - Located on applicant property
- Project substation
- O&M facilities
- Project parking
- Storm water retention basins
- Fencing and gates
- Interior access roads

Industrial buildings, warehouses, engineered containers, and/or electrolyte storage tanks would be the primary structures needed to house the main project components. Other components to be located on the project site and adjacent to the proposed buildings, warehouses, containers, and tanks include the following:

- Inverters, transformers, power distribution panels
- Underground water-main loop for project operation and fire prevention
- Underground cable to connect to project substation
- Project site access roads (unpaved/crushed rock)
- Fire water storage tanks
- Above ground water storage tanks
- Heating, Ventilation, and Air Conditioning (HVAC) units
- Ground-mounted or roof-mounted photovoltaic (PV) arrays
- Emergency backup generator(s)

### **2.2.2.1 O&M Facilities**

The O&M facilities are expected to be the only manned facility on the site. It would include up to approximately 20 full-time employees depending upon the number of phases and type of energy storage facility constructed. O&M employees would work typical weekday

hours but may work extended hours, including weekends and 24 hours a day, depending upon the operations and maintenance needs. No offices or staffed control centers would be located within the storage-specific warehouses/buildings. For sanitary waste, the project would include a septic leach field to be located near the O&M facilities. The proposed O&M facilities would also require an HVAC unit.

### **2.2.2.2 Permanent Vehicle Access**

There are no circulation element roadways in the immediate vicinity of the project site. The nearest freeways are I-8, located 4.6 miles north of the project site, and State Route 98 (SR-98), located 5.2 miles south of the project site. Drew Road, a two-lane collector, is located 1.3 miles east of the project site. All other roadways in the immediate vicinity of the project site are rural roadways. All roadways that would be used to access the project site from I-8 are currently paved, except for the portion of Liebert Road south of Wixom Road. However, this segment would be paved or graveled prior to project operation.

The project is surrounded by private landowners to the east, BLM land to the south and west, and IID maintenance roads and Westside Main Canal to the north. Due to the project site having no direct vehicular access routes, the applicant is proposing to construct roads on both the north and south sides of the Westside Main Canal on private land, and a new clear-span Imperial County-specified bridge over the Westside Main Canal.

The permanent new clear-span County-specified bridge would span the Westside Main Canal to connect to a proposed access road easement on the north side of the Westside Main Canal. The north side proposed access road would ultimately connect the project to county road (CR) Liebert Road.

Construction of the permanent clear-span bridge spanning the IID's Westside Main Canal requires CED to have access to both the north side and the south of the Canal to perform the necessary construction activities. In addition to being necessary to facilitate construction of the new permanent clear-span bridge, access from the south side of the Canal would allow CED to commence construction on the first phase of the project simultaneously, thereby shortening the duration of construction and potentially minimizing the associated impacts. CED is evaluating various options for temporary construction access, including accessing the project site from the south side of the Westside Main Canal off SR-98, as well as options involving access from the north side of the Westside Main Canal from I-8.

Option 1 would use the existing SDG&E maintenance road off Highway 98, which extends approximately 4.4 miles to the IV Substation. Option 1 would then continue along an existing 1.2-mile-long dirt access road that leads north, then east, outside the western and northern boundaries of the substation. Option 1 then continues northwest along an existing

dirt access road that parallels two power lines until the access road connects with the western edge of the project. The existing dirt road was constructed for the construction and maintenance of the existing Campo Verde – Imperial Valley gen-tie line. Option 2 would use the existing IID Westside Mail Canal access road. The selected temporary access option would be used until construction of the permanent bridge is completed. Both temporary construction access routes are presented in Figure 4.

### **2.2.3 BATTERY STORAGE COMPONENTS**

The first phase of site construction would consist of either a lithium-ion battery storage facility or a flow battery storage facility. This first phase would be dependent on the first commercial contract awarded to the applicant by a customer. Large industrial buildings, warehouses, and/or containers to house the storage equipment, including battery cells, modules, racks, and controls for lithium-ion technologies, would be needed. For flow battery technologies, cell stack modules, pumps, and controls may be installed inside industrial buildings or pre-engineered outdoor enclosures. Electrolyte storage tanks and associated piping may be located indoors or outdoors, depending on the technology.

#### **2.2.3.1 Battery Modules Technology**

##### **Energy Storage**

Energy storage is the capture of energy produced at one time for use at a later time. A device that stores energy is generally called an accumulator or battery. Energy storage involves converting energy from forms that are difficult to store to more conveniently or economically storable forms. For the purpose of grid connected energy storage, electrical energy will be stored in the form of chemical energy in lithium-ion and/or flow batteries. Energy storage technology may be centralized or may be distributed throughout the plant. Due to requirements for energy storage, the project components such as the switching station, substation, transformers, and inverters will energize at all times with the potential to charge or discharge.

##### **Lithium-Ion Battery**

A lithium-ion battery is also a type of rechargeable battery. In the batteries, lithium ions move from the negative electrode through an electrolyte to the positive electrode during discharge, and back when charging. Lithium-ion batteries use an intercalated lithium compound as the material at the positive electrode and typically graphite at the negative electrode. The batteries have a high energy density, no memory effect and low self-discharge.

### Flow Battery

A flow battery is a rechargeable fuel cell in which an electrolyte containing one or more dissolved electroactive elements flows through an electrochemical cell that reversibly converts chemical energy directly to electricity. Additional electrolyte is stored externally, generally in tanks, and is usually pumped through the cell (or cells) of the reactor, although gravity feed systems are also known to be used. Flow batteries can be rapidly "recharged" by replacing the electrolyte liquid while simultaneously recovering the spent material for re-energization. Many flow batteries use carbon felt electrodes due to its low cost and adequate electrical conductivity.

#### **2.2.3.2 Backup Generators**

The project would include emergency backup generator(s) to supply auxiliary power to the facility during rare events in which the entire facility or portions of the facility are disconnected from the electrical grid system. The generators would be sized to accommodate control systems and HVAC loads for equipment protection. The purpose of the generators would be to provide system safety for events in which the transmission interconnection and the on-site solar generation system are not available, by supplying the battery HVAC system to maintain battery safety and warranty temperature parameters.

These generators may be either installed in a central location near the common facilities or distributed among individual buildings or containers. They may be diesel, natural gas, or propane fueled. The generators would be periodically tested each year to maintain backup capability in the event of a grid emergency. All generators would be subject to Imperial County Air Pollution Control District review and permitting requirements.

Table 1 is a generalized depiction of installed emergency generator capacity based on 1,000 MW of lithium-ion batteries and 1,000 MW of flow batteries, including their safety and warranty temperature parameters. Size and quantity will scale with the MW proposed in each phase. Detailed design is required to accurately calculate the generator load, which will be included with each design phase based on the final battery technology selection.

<b>Table 1</b>				
<b>Approximate Generator Size</b>				
<b>Technology</b>	<b>Project Size (MW)</b>	<b>Backup Generator Size (kW)</b>	<b>Backup Generator Quantity</b>	<b>Total Backup Generator Size (kW)</b>
Lithium-ion	1,000	1,750	20	35,000
Flow	1,000	1,000	20	20,000
<b>Total</b>	<b>2,000</b>	<b>--</b>	<b>--</b>	<b>55,000</b>

## **2.2.4 SOLAR FACILITY COMPONENTS**

Photovoltaic solar cells, also called PV cells, convert sunlight directly into electricity. PV gets its name from the process of converting light (photons) to electricity (voltage), which is called the PV effect. The panels are mounted at a fixed angle facing south, or they can be mounted on a tracking device that follows the sun, allowing them to capture the most sunlight. Many solar panels combined together to create one system is called a solar array. On-site PV solar generation would serve as station auxiliary power and be deployed throughout the project site.

## **2.3 Site Security**

A six-foot-tall fence (e.g., chain-link) topped with one-foot-tall barbed wire would be installed around the entire project site for safety and in order to control access. The switching station and each substation proposed on the site plan would also have fences installed around its perimeter. A camera-equipped call button would be installed at the front entry gate to the site which would be monitored from the project's O&M facilities. Throughout the site at various points, security cameras may be installed to monitor other areas of the project site. During the construction of each project phase, the applicant would have on-site security personnel between dusk and dawn and during hours of non-active construction.

## **2.4 Interconnection Options**

The proposed point of interconnection for the project is the IV Substation 230 kilovolt (kV) bus. As reflected in the conceptual site plan, to achieve this, the applicant plans to build a new loop-in switching station on the project site and connect to the existing IID Campo Verde - Imperial Valley 230 kV radial gen-tie line. This existing gen-tie line ultimately connects to the IV Substation one-third mile south of the project site. This location would serve as the project's point of interconnection to the CAISO grid. The applicant submitted the necessary Interconnection Request Applications to the CAISO and IID in 2017 and 2018, and approval is pending.

## **2.5 Existing and Proposed Utility Easements**

### **2.5.1 EXISTING EASEMENTS**

The project site (APNs 051-350-10 and 051-350-011) has three major easements lying across the site. The first is for overhead collector transmission circuits and utility facilities, as well as access. This is for the IID Campo Verde - Imperial Valley 230 kV transmission line easement, which lies inside and along the west property line and runs north/south.

The second major easement is a prescriptive easement for an overhead transmission circuit and a utility distribution line that runs north and south and lies directly in the center of the project site. The IID transmission line within this prescriptive easement is known as

the S-Transmission line (S-Line). The third major easement lies along the north property line. This easement was granted to IID for the purposes of the existing Westside Main Canal and operation and maintenance roads adjacent to the Westside Main Canal.

### **2.5.2 PROPOSED EASEMENTS**

The applicant and IID are in the process of determining the width of this S-Line easement to create a non-exclusive easement. This easement would also include the existing distribution line that lies within the easement. Until this new easement agreement is in place, the applicant has planned for a 300-foot temporary corridor on the project site plan (centerline of 300-foot corridor is the S-Line) to allow the IID energy engineering team to design and implement an appropriate new easement. Once the width and location of the new easement is determined, all other areas not part of the new S-Line easement lying within the 300-foot corridor will become part of the project site.

## **2.6 Project Operation**

Operation of the project would require routine maintenance and security. It is anticipated that the project would employ a plant manager and an O&M manager, as well as the addition of a facility manager once the complex deploys approximately 500 MW of generation. The complex will also employ staff technicians, with at least one additional technician for every approximately 250 MW of capacity.

Operation of the project at full build-out would require up to approximately 20 full-time employees depending upon the number of phases and type of energy storage facility constructed. The project may require fewer full-time equivalent employees, but 20 was assumed to provide a conservative estimate. O&M employees would work typical weekday hours but may work extended hours, including weekends and 24 hours a day, depending upon the operations and maintenance needs. Assuming two one-way trips per employee, the project would be anticipated to generate up to 40 trips per day from all maintenance and security personnel.

Figure 3 shows the conceptual site plan for the project with a representation of lithium-ion buildings and containers as well as flow buildings and containers. The components that make up the energy storage systems and common facilities require various preventative maintenance and at times corrective maintenance. The O&M staff would maintain the project in accordance with manufacturer and industry best practice maintenance schedules and requirements. Depending on the technology selected for the energy storage component, the substation and transmission lines as well as the behind-the-meter solar inverters and transformers would be energized at all times.

## **2.7 Land Use and Zoning**

The project site is currently zoned A-3 (Heavy Agriculture). Agricultural zoned land lies to the north, south, east, and west of the project site. The project proposes a General Plan Amendment and Rezone to change the land use designation and zoning for the project site from Agriculture (A-3) to Industrial. The Industrial zoning would be limited to Energy Production/Use.

## **2.8 Regulatory Framework**

### **2.8.1 STATE**

#### **2.8.1.1 Southern California Association of Governments**

The Southern California Association of Governments (SCAG) is responsible for fulfilling certain state requirements related to the California Environmental Quality Act (CEQA). Pursuant to CEQA, SCAG is responsible, through their Intergovernmental Review section, for reviewing regionally significant local plans, projects, and programs for consistency with SCAG's adopted regional plans.

#### *Analysis*

The IRG section does not include any relevant policies that address aesthetics, light or glare, so therefore the project cannot be reviewed for consistency with IRG policies.

### **2.8.2 LOCAL**

#### **2.8.2.1 Imperial County General Plan**

The Imperial County General Plan is a broad-based planning document that contains text, maps, and diagrams explaining the County's long-range growth and development goals and policies. The adopted General Plan contains the Renewable Energy and Transmission Element which contains policies related to visual resources.

#### *Renewable Energy and Transmission Element*

This Element addresses the potential impacts associated with renewable energy to existing visual character and quality, including scenic vistas, natural environment and existing landscape, general built environment and historic buildings, and scenic highways. In addition, the Element identifies the potential for Renewable energy facilities to create new sources of substantial light or glare which would adversely affect day or nighttime views in the area.

## **E. Implementation Standards**

### **3. Environmental**

The design, siting, and operation of renewable energy facilities shall give adequate consideration to potential direct and indirect environmental impacts pursuant to the California Environmental Quality Act related to aesthetics.

### **2.8.2.2 Zoning Ordinance**

The Imperial County Zoning Ordinance provides detailed regulatory provisions for development of all lands within the county. County zoning is used to implement the goals and objectives of the adopted General Plan in accordance with state law, which requires that the General Plan and corresponding zoning be consistent with one another. The project site is currently zoned A-3 (Heavy Agriculture). The project proposes a General Plan Amendment and Rezone to change the land use designation and zoning for the project site from Agriculture (A3) to Industrial.

## **3.0 Visual Environment of the Project**

The visual environment of the project is generally defined by the desert region within which it's located, where elevations range from below sea level to over 3,000-feet above mean sea level (AMSL) and the terrain includes a mountain backdrop, alluvial fans and desert floor. Views are expansive and characterized by dramatic landforms, native desert habitat, and low desert valleys where the form, line, color, and texture, of the natural setting is comingled with utility transmission towers, substations, industrial solar photovoltaic installations, intensive agriculture, and residential and commercial development.

### **3.1 Project Setting**

The site is generally flat, having been graded to support agriculture, its current use, and is approximately 6' below AMLS at its high and 22' below AMLS at its low.

Several residences, the Westside Elementary School, IID Campo Verde Solar facility, and a residential community are located to the north. Drew Road, several residential structures, agricultural fields, and open space are located to the east, and BLM land managed mainly as open desert, to the south and west of the project. The Imperial Valley Substation, with its numerous tall transmission towers, and other equipment, is located on BLM land south of the project.

Character views depicting the project setting are provided as Figures 5a and 5b, Existing Conditions.

Very little light and glare is generated in this area of the County. The primary source of light and glare in the area is from motor vehicles traveling on surrounding roadways. Glare is generated during daytime hours from the sun's reflection off cars and paved roadway surfaces. Likewise, at night, vehicle headlights on surrounding roadways generate light and glare. Warning lighting is also located on the existing transmission lines to alert aircraft of potential flight path hazards. Lighting associated with the Imperial Valley Substation and IID Campo Verde Solar facility is also present.

## 3.2 Project Viewshed

A “viewshed” is an analytical tool used to aid in the identification of views that could be affected by a potential project. The viewshed is defined as the surrounding geographic area from which the project is likely to be seen.

The project viewshed, provided as Figure 6, Generalized Viewshed, was determined through an analysis of aerial photographs, and topographic data produced and distributed by the USGS. This data is based on the National Elevation Dataset (NED) and uses 1/3 arc second data (approximate 10-meter accuracy). The viewshed does not account for intervening structures and vegetation that obstruct views toward the site but provides us with a generalized presentation of areas from which views of the site are available. Viewshed analysis was prepared using Global Mapper and evaluated the visibility of a 60’ transmitter to a receiver located 5’ above ground elevation.

Due to the relatively flat topography of the project site and surrounding area, views of the project are available from Interstate 8 to the north and northwest, Drew Road (County Highway 29) to the east, and local roadways to the north, and east.

## 4.0 Existing Visual Resources and Viewer Response

### 4.1 Existing Visual Resources

#### 4.1.1 VISUAL CHARACTER

Our understanding or cognition of the visual environment is based on the visual character of objects and the relationships between them. Descriptions of visual character can distinguish at least two levels of attributes: pattern elements and pattern character.

Visual pattern elements include an object’s form, line, color, and texture. Our awareness of these pattern elements varies with distance, for example individual details are lost and colors are muted as distances increase.

Pattern character refers to the visual relationships between these elements. Differences in visual character are generally traced to four aspects of pattern character: dominance, scale, diversity, and continuity. For example, there is a great difference between the visual character of country road and I-8, although both may exhibit similar line, color, and texture.

The four aspects of pattern character are defined as follows:

- Dominance: Specific components in a landscape may be visually dominant because of position, extent, or contrast of basic pattern elements.
- Scale is the apparent size relationship between a landscape component and its surroundings; an object can be made to look smaller or larger in scale by manipulating its visual pattern elements.

- Visual diversity is a function of the number, variety, and intermixing of visual pattern elements.
- Continuity is the uninterrupted flow of pattern elements in a landscape and the maintenance of visual relationships between immediately connected or related landscape components.

The project and project setting are assessed according to these attributes (see Visual Inventory/Character Evaluation, and Visual Quality Evaluation, provided as Figure 7 and Figures 8a and 8b) and if their visual character is similar, the visual compatibility of the project will be high. If the visual character of the project contrasts strongly with the visual character of its setting, its visual compatibility will generally be low. As noted on these assessment forms, evaluations are based on both photo simulations and through extrapolation.

#### **4.1.2 VISUAL QUALITY**

Aesthetics is not only concerned with the character of the visual experience, but also with its quality. The perception of quality is based upon a viewer's response to vividness, intactness, and unity occurring within the visual environment. These factors affect perceptual quality and are defined as follows:

- Vividness is the visual power or memorability of landscape components as they combine in striking and distinctive visual patterns.
- Intactness is the visual integrity of the natural and man-built landscape and its freedom from encroaching elements.
- Unity is the visual coherence and compositional harmony of the landscape considered as a whole.

Areas with high visual quality are those where all three of these factors are high. Areas with Moderate Visual Quality are those where one of these factors is low. Areas with low visual quality are those where two or more of these factors are low.

While many elements of the project's visual environment are considered memorable and distinct, both natural and man-made, they are not intact, free from visual encroachments, nor do they join to form coherent, harmonious, visual patterns associated with high quality visual environments. The area is therefore considered to have a low to medium visual quality rating.

#### **4.2 Viewer Response**

Viewer response is composed of two elements: viewer sensitivity and viewer exposure. These elements combine to form a method of predicting how the viewers might react to visual changes brought about by a project.

#### **4.2.1 VIEWER SENSITIVITY**

Viewer sensitivity is both the viewers' concern for scenic quality and the viewers' response to change in the visual resources that make up the view.

#### **4.2.2 VIEWER GROUPS**

Primary viewer groups exposed to the project consist of motorists, and surrounding residents, residential community golf course users, and school attendees.

#### **4.2.3 VIEWER EXPOSURE**

The number of viewers and the duration of view are also important to analyzing impacts.

The number of viewers in nearby residences (stationary view), and the duration of their view of a project would be very different than the number of people who see a project from a highway or roadway (moving view). Whether the viewers on the highway are residents of the local community or visitors may also affect their responses to a viewshed.

Viewer exposure is typically assessed by measuring the number of viewers exposed to the resource change, type of viewer activity, duration of their view, speed at which the viewer moves, and position of the viewer. Viewer exposure is described in greater detail in Chapter 5, Visual Impact Assessment.

#### **4.2.4 VIEWER AWARENESS**

A viewer's response is also affected by the degree to which he/she is receptive to the visual details, character, and quality of the surround landscape. A viewer's ability to perceive the landscape is affected by his/her activity. A viewer on vacation would probably take pleasure in looking at the landscape, and an individual may be strongly attached to the view from his/her home, but a local County resident commuting to work may not "register" those same visual resources on a daily basis. Viewer exposure is described in greater detail in Chapter 5, Visual Impact Assessment.

#### **4.2.5 SENSITIVITY TO CHANGE**

Visual sensitivity is based on an area's ability to absorb changes in character and quality. Areas with a high sensitivity to change are those that are visually prominent, distinctive, contain a dominant visual character element, and have high visual quality. These are areas that would contrast to a great degree with a proposed improvement.

An area with moderate sensitivity to change would contain a several visual character elements that vary in form, line, color, and texture, and that is of moderate visual quality. An area with low sensitivity to change are those that have many visual character elements that vary in form, line, color and texture, and is of low visual quality.

## 5.0 Visual Impact Assessment

This section describes the potential impacts related to aesthetics for the project. It describes the guidelines used to determine significance and identifies potential mitigation measures to reduce impacts below levels of significance.

### 5.1 Guidelines for Determining Significance

The project will result in a significant impact if it would:

#### 5.1.1 Visual Resources

Guideline No. 1: Have a substantial adverse effect on a scenic vista

Guideline No. 2: Substantially damage scenic resources, including, but limited to, trees, rock outcroppings, and historic buildings within a state scenic highway.

Guideline No. 3: Substantially degrade the existing visual character or quality of the site and its surroundings.

#### 5.1.2 Light and Glare

Guideline No. 4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.

#### 5.1.3 Consistency with Policy & Planning documents

Guideline No. 5: The project would not comply with applicable state or local goals, policies, or requirements related to visual resources including but not limited to the California Scenic Highway Program, Imperial County General Plan & Zoning Ordinance, as applicable.

### 5.2 Guideline Sources

**Guideline Nos. 1 and 2** are derived from the CEQA Guidelines, Appendix G, Environmental Checklist Form and are intended to support definition of whether the proposed project will have a significant impact on visual character and quality. Due to this circumstance, these two significance guidelines are based on established principles from the most widely used and accepted visual resource assessment methodologies, including the U.S. Department of Transportation, *Federal Highway Administration's Visual Impact Assessment for Highway Projects*; the U.S. Department of Agriculture, Forest Service Visual Management System; and the U.S. Department of Interior, Bureau of Land Management (BLM) modified Visual Management System. The concepts contained in these assessment approaches provide accepted practices for evaluating visual resources both objectively (visual character) and subjectively (visual quality). This is accomplished by comparing the existing visual environment to the construction and post-construction visual environment; and subsequently, determining whether the project will result in

physical changes that are deemed to be incompatible with visual character or degrade visual quality, as outlined in Guideline Nos. 1 and 2.

**Guideline No. 3** is based in part on the principles discussed above as well as those contained in County's General Plan related to preservation of visual resources.

**Guidelines Nos. 4 and 5** rely on policies contained in the Imperial County General Plan related to preservation of visual resources and aesthetics. Furthermore, the plan recognizes that renewable energy facilities may also create new sources of substantial light or glare which would adversely affect day or nighttime views in the area. Because of the proximity of several military installations in the area, future substantial sources of light and glare which would adversely affect day or nighttime views in the area would be considered significant as would projects that don't comply with applicable policies related to visual resources.

In compliance with the thresholds of significance and analysis methodologies determined for the project, this analysis includes the following elements and considerations:

- A map of the viewshed and a discussion of communities and roads from which it may be viewed as a prominent feature.
- A discussion of the compatibility of the scale and mass of the proposed project with the surrounding area.
- A discussion of the architectural style of the structures and their site utilization related to the manner in which surrounding properties have developed.
- Photo simulations and analysis comparing project to existing setting.

## **5.3 Analysis of Project Effects and Determination of Significance**

### **5.3.1 HAVE A SUBSTANTIAL ADVERSE EFFECT ON A SCENIC VISTA (GUIDELINE 1)**

The composition of views from areas and roadways surrounding the project would change as a result of project implementation, however, no designated scenic vistas are identified in the Imperial County General Plan for the area, so the impact is therefore considered **less than significant**.

### **5.3.2 DAMAGE SCENIC RESOURCES WITHIN A STATE SCENIC HIGHWAY (GUIDELINE 2)**

The project site is not visible from a designated Scenic Highway, nor from a route considered eligible for designation, so therefore this Guideline is not applicable.

### **5.3.3 DEGRADE THE EXISTING VISUAL CHARACTER OR QUALITY OF THE SITE AND ITS SURROUNDINGS (GUIDELINE 3)**

The proposed project would convert existing agricultural lands to a battery energy storage complex by replacing vegetation, and disturbed land with man-made elements including lithium-ion battery and/or flow battery energy storage facilities, a behind-the-meter solar energy facility to serve auxiliary power needs, a new on-site 230 kilovolt (kV) loop-in switching station, a 34.5 kV to 230 kV substation, underground electrical cables and other support equipment and structures, and permanent vehicular access to and from the site over a proposed bridge spanning Imperial Irrigation District's (IID's) Westside Main Canal. The project would occupy approximately 163.3 acres and would consist of industrial buildings, 30'-60' in height and approximately 140'-400' in length, that would house lithium-ion and/or flow battery storage technologies. In addition, there would be ground and/or roof-mounted solar PV for auxiliary power needs, storage tanks up to 50' in height, a battery storage system enclosed in 8' tall containers stacked up to 4 high, with a maximum anticipated height of 40'. A proposed loop-in switching station, project substation, retention ponds, operations and maintenance building, bridge crossing and circulation improvements are also planned for the project (see Site Plan & Site Plan Elements, Figure 3 and Figures 9 and 10).

#### **Short Term Visual Affects**

The project would be built in three to five phases over 10-year period, with each phase ranging from approximately 25 MW up to 400 MW per phase. During that time, short term impacts associated with project construction would occur as heavy equipment, materials, and vehicular traffic (see Figure 4, Temporary Construction Access Routes), are added to the site. This would impact nearby residences and users of area roadways, including I-8 and Drew Road. Lighting from construction activities and daytime glare from equipment and vehicles would be increased during construction periods. As phases of the project are completed, equipment would be removed and/or relocated elsewhere on the site, thereby potentially reducing the impact. While construction impacts are potentially significant, due to their short duration they are anticipated to be **less than significant**.

#### **Long Term Visual Affects**

The proposed project would alter the visual environment of an area that is transitioning from intense agriculture to energy production by introducing a new battery storage facility, a new bridge crossing the Westside Main Canal, large industrial buildings housing lithium-ion and/or flow battery storage technologies, stacked containerized battery storage systems, a loop-in switching station, project substation, connection to the IID Campo Verde – Imperial Valley transmission gen-tie line, operations & maintenance building, project parking, ground and/or roof mounted solar PV arrays, water storage tanks, security lighting, and other equipment and support facilities.

The entire site would be surrounding by a 6-foot chain link security fence topped with barbed wire and posts spaced 8-10' on center. The fence would provide minimal screening and most of the site would be visible from surrounding areas where view blocking vegetation, structures, and landforms do not exist.

### **Key Observation Points**

Key Observation Points (KOPs), selected and described below, represent typical views experienced by primary viewer groups.

Existing views of the project are available from areas surrounding the site, specifically from I-8, Drew Road, and local roadways (Wixom, Vaughn, and Liebert Road). Additionally, views of the project are available from the Westside Elementary School, Rio Bend RV and Golf Resort, and nearby residences.

To evaluate visual impacts, 12 KOPs were selected (see Figure 2, Vicinity Map & Key Observation Point Locations). The KOPs identified are described below:

#### **View from Interstate-8**

Views of the project are available from Interstate 8 (see KOP 1) which is located approximately 5.1 miles west of the site. From this location views are expansive and distant and include, memorable mountain landforms, desert floor with native habitat, overhead utilities and tower structures, development, intensive agriculture, and industrial scaled solar installations. From locations along I-8, project features such as the buildings, utility connections, and substation, will be visible and viewed in conjunction with the other elements described above. This will reduce project contrast such that it will appear as an extension of the elements that surround it, i.e., the structures, overhead utilities and transmission towers, substation, and tree groupings. Given the setting's lack of intactness and unity, existing views are assigned a low to medium visual quality rating. And while the project is visible in the background over an approximate distance of 0.5 mile, or several seconds traveling at 65 mph, it's contrast would be minimized due to its distance away from visual receptors and visual relationship to existing man-made elements in view. It is therefore anticipated that **visual impacts associated with the project along this corridor will be less than significant.**

#### **View near the Westview Elementary School looking southeast.**

Views from the Westview Elementary School encompass a foreground of agricultural fields, dirt roads, irrigation canals lined by view blocking vegetation and earthen berms, a middle ground containing the Campo Verde Solar facility, overhead utilities, the Imperial Valley Substation, and mountain backdrop (see KOP 2, Figure 11). This area is given a low visual quality rating based on its lack of vividness, intactness, and unity.

The project, as viewed from this location (see Photo Simulation KOP 2, Figure 12), will be visible behind photovoltaic arrays, substation, operations buildings, and overhead utilities associated with the Campo Verde facility, and will be seen in front of and amongst

structures associated with the Imperial Valley Substation and utility corridors. Buildings and structures will relate architecturally in terms of form, material, and color with other structures in the viewshed. Foreground view blocking vegetation and earthen berms will substantially screen the lower portions of the project from view, but overhead utilities and upper portions of buildings will be visible. As such, visible project components will relate to that which exists such that contrast is reduced between the project and existing visual environment. While the project will introduce a scale of structure not currently present in this viewshed, it will appear less dominant from this location than many of the existing elements in view. Furthermore, project buildings will be non-reflective and painted in light, earth-tone colors which will further reduce project contrast by relating to other colors in view, both man-made and natural. It is therefore anticipated that **changes to the visual environment, as a result of the project, will be less than significant.**

### **Nearby Residential Communities**

*KOP 3 represents a view looking south from the southern end of the Rio Bend RV Resort and Golf Course Community. Views from this KOP encompass the verdant landscape associated with the Rio Bend development, agricultural fields and outbuildings, natural vegetation, solar facilities, and memorable mountain landforms in the background (see Figure 13).*

This view has been assigned a low-med visual quality rating based on its vividness, intactness, and unity and is representative of what residents and guests will see looking south toward the project.

As viewed from this location (see Photo Simulation KOP 3, Figure 14), the project will be partially visible behind a foreground of view blocking vegetation, landforms, and structures. It will be viewed amongst equipment and structures associated with Campo Verde facility and Imperial Valley Substation. As such, project components will relate to existing elements in view, such as the transmission towers and overhead utilities, buildings, and photovoltaic arrays, which will reduce contrast between the project and existing visual environment. While the buildings will introduce a scale of structure not present in this viewshed, they will be lower than the other existing man-made elements that lie nearby, will be partially screened by view-blocking vegetation and berms associated with the adjacent canal, and will be painted in light earth tone colors, thereby relating to other elements in view, both man-made and natural. As such, it is anticipated that contrast will be reduced and the **change to the visual environment as a result of the project will be less than significant.**

### **Views from Neighboring Residences & Local Roadways**

Key Observation Points 4, 6, and 8, represent views of the project from surrounding residences and local roadways (Liebert, Wixom, and Vogel Roads).

Views from these locations encompass intensive agriculture, the Campo Verde Solar facility, overhead utilities, and mountain backdrop (see Figure 15).

This area is assigned a low visual quality rating based on lack of vividness, intactness, and unity and is representative of what residences and travelers along local roadways will experience when viewing the project.

The project as viewed from these areas (see Photo Simulation KOP 6, Figure 16) will appear amongst equipment and structures associated with Campo Verde facility and Imperial Valley Substation, partially screened by view-blocking vegetation and berms that line the adjacent canal. As such, project components will relate to a large degree to the existing elements in view, both man-made and natural. Project components will relate to existing overhead utilities, buildings, photovoltaic arrays, and vertical vegetative groupings. While the buildings will introduce a scale of structure not currently present in this viewshed, they will appear lower than the other man-made elements that surround them, will relate architecturally to surrounding structures and buildings, and will be painted in light, earth-tone colors to relate to other elements in view, both man-made and natural. Dominant mountain landforms will remain visible and foreground vegetation and canal berms will screen lower portions of the project from view. It is therefore anticipated that contrast will be reduced such that the **change in visual environment as a result of this project will be less than significant from these locations.**

#### **Views from Roadways Adjacent to Project**

Views from roadways adjacent to the project, KOPs 5, 11, & 12, depict views from Mandrapa and Liebert Roads looking south and east toward the project. Views from these areas encompass a variety of elements including dirt roadways, fallow fields, agriculture, desert vegetation, dominant patterns of overhead utilities, the Westside Canal and associated earthen berms, the Campo Verde facility, and a background consisting of mountains and dominant landforms (see Figure 17).

These are close-proximity views and represent areas most affected by the project. They are also areas that receive the least amount of traffic, as they are corridors used primarily for canal maintenance, access to the Campo Verde facility and project access.

As viewed from these areas, the project will appear rising behind the earthen berms behind a foreground of vegetation and structures. As with the other views, it will relate to a large degree to the existing man-made elements in view, appearing as an extension to that which exists, relate in form, line, color and texture, to the existing overhead utilities, outbuildings, photovoltaic arrays, and operations center of the neighboring Campo Verde facility and equipment of the Imperial Valley Substation.

While the industrial buildings will introduce a scale of structure not currently present in this viewshed, they will appear lower than some of the other man-made elements that surround them and will be painted in light, earth-tone colors, thereby relating to other elements in view, both man-made and natural. Dominant mountain landforms will remain visible and foreground vegetation and canal berms will screen and buffer the lower portions of the project from view.

It is therefore anticipated that the **change in visual environment as a result of the project will be less than significant.**

#### **Views from Local Highways**

The Drew Road Corridor (S29) offers views of the project to north and southbound travelers (KOPs 7, 9, & 10). Views from this corridor encompass a foreground of agricultural fields, dirt roads, irrigation canals, a middle ground containing the Campo Verde Solar facility, overhead utilities, the Imperial Valley Substation, tall vegetation, and mountain backdrop (see figures 18 and 19). This area is assigned a low visual quality rating based on its lack of vividness, intactness, and unity.

Given the design speeds along this corridor (55 mph+/-), views of the project will be of short duration. Where visible between view-blocking foreground vegetation, and structures (Photo Simulation KOP 10, Figure 20) the project will be visible on the horizon, backed by dominant landforms, and will relate to existing transmission towers and man-made structures within the viewshed. This will serve to reduce the contrast between the project and existing visual environment.

It is therefore anticipated that, from views from local highways, **the change in visual environment as a result of the project will be less than significant.**

#### **5.3.4 CREATE A NEW SOURCE OF SUBSTANTIAL LIGHT OR GLARE (GUIDELINE 4)**

The project proposes to use security and operation lighting and non-reflective photovoltaic (PV) panels, roof top and ground-mounted, which are not anticipated to create substantial adverse light and glare impacts to surrounding areas. While there exists some potential for low angle reflection from PV panels directed south during the summer solstice, as well as some indirect reflection, adverse impacts to the built environment associated with either are not anticipated to be significant, according to the Campo Verde's Solar Glare Analysis. In addition, the project's lighting system will be designed to provide minimum illumination for security and safety. Therefore, impacts associated with substantial light and glare are considered **less than significant.**

#### **Construction:**

During construction, short -term sources of lighting and glare will occur as part of the site's staging, storage, security areas, and from vehicles accessing the site. Construction related lighting will be directed on-site. Short term sources of glare from vehicle windshields or metallic surfaces of PV panels and support structures may occur but It is anticipated that construction related lighting and glare impacts would be **less than significant.**

#### **Operation:**

Project lighting would be the minimum needed to illuminate service and security areas. Lighting would be directed on-site and utilize shielding as necessary to minimize light

intrusion into dark skies and onto neighboring properties. While new sources of nighttime lighting will be introduced into the area, it is not anticipated to be substantial.

As described in further detail below, PV panels are designed to absorb light and not reflect it. Building materials, as well, will be non-reflective. While some glare impacts will occur as a result of project construction, they are not anticipated to be substantial.

While new sources of light and glare will not occur as a result of this project, they are anticipated to be **less than significant**.

### *Reflectivity of Flat-plate Photovoltaic Solar Panels*

As discussed in the Solar Glare Analysis prepared by the Good Company for several photovoltaic ground-mounted array installations in Imperial County (citations noted), flat-plate photovoltaic solar panels are designed to absorb sunlight in order to convert it into electricity<sup>1</sup>. Monocrystalline silicon wafers, the basic building block of most photovoltaic solar modules, absorb up to seventy percent of the sun's solar radiation in the visible light spectrum<sup>2</sup>. Solar cells are typically encased in a transparent material referred to as an encapsulant and covered with a transparent cover film, commonly glass. The addition of these protective layers further reduces the amount of visible light reflected from photovoltaic modules. Photovoltaic panels are using the absorbed energy in two ways; 1) the panels generate electricity, and 2) the mass of the panels heat up.

To maximize the efficiency of electricity production, the study states, photovoltaic manufacturers design their panels to minimize the amount of reflected sunlight. The most common methods to accomplish this are the application of anti-reflective coatings and surface texturing of solar cells. Combined, these techniques can reduce reflection losses to a few percent.<sup>3</sup> Most solar panels are now designed with at least one anti-reflective layer and some panels have multiple layers.

### *Comparison of the Reflectivity of Solar Panel to the Surrounding Environment*

One measure of reflectivity of solar panels to the surrounding environment described is albedo – the ratio of solar radiation across the visible and invisible light spectrum reflected by a surface. Albedo varies between 0, a surface that reflects no light, and 1, a mirror-like surface that reflects all incoming light. Solar panels with a single anti-reflective coating have a reflectivity of around 0.10.<sup>4</sup> By comparison, sand has an albedo between 0.15

<sup>2</sup> Luque and Hegedus. 2003. Handbook of Photovoltaic Science and Engineering. Wiley and Sons, New Jersey

<sup>3</sup> Ibid.

<sup>4</sup> Lanier and Ang. 1990. Photovoltaic Engineering Handbook. New York: Taylor & Francis.

and 0.45 and agricultural vegetation has an albedo between 0.18 and 0.25.<sup>5</sup> **In other words, solar panels have a lower reflectivity than the area's prevailing ground cover, sand and agricultural crops as the Good Company study states.**

*Visibility of a Direct Reflection of Sunlight for South Facing Fixed Mount Panels*

The Good Company study describes the impact of south facing PV panels as follows:

To maximize electricity production, solar panels must be oriented toward the sun as much as possible. For the purpose of this analysis it is anticipated that the panels will face polar south at a tilt of 25 degrees above horizontal. The position of the sun relative to the solar panels will vary by the time of day and time of year. As a result, the angle of direct reflection from the panels will also vary accordingly. The greatest likelihood of a low angle of direct reflection that might impact the built environment occurs midday on the summer solstice when the sun is at its highest point in the sky and the angle of reflection is lowest. The potential impact at that moment is the best proxy for maximum impact overall. During summer solstice at the proposed project's latitude, the sun's solar elevation is approximately 80 degrees<sup>6</sup>. With the sun at this height, the resulting angle of direct reflection is approximately 50 degrees above the horizon. It is unlikely that any objects in the built environment near the project site would be adversely affected by a direct reflection of sunlight from this angle, including vehicles traveling on nearby roads or houses south of the project site.

During the winter months, when the sun travels across the sky at lower angles relative to the horizon, the angle of reflection and the resulting height of the reflected sunlight are higher. At midday on the winter solstice at the proposed project's latitude, the sun's solar elevation is approximately 34 degrees. At this angle of elevation, the resulting angle of reflection is 96 degrees. At this angle of reflection, the height of the reflected sunlight would exceed 190 feet in elevation at a distance of only 20 feet away and the further away from the array the greater the height of the reflected sunlight.

While the discussion above discusses direct reflection, the Good Company's study also addresses indirect reflections, which is the visibility of diffused sunlight on the surface of panels. As is the case with direct reflections, indirect reflections are not considered a significant concern since they are significantly less intense and as the study notes, moving just 30 degrees off a direct reflection lowers light intensity by nearly 80%.<sup>7</sup> And while at

<sup>6</sup> Based on sun chart produced by University of Oregon Solar Radiation Monitoring Laboratory's Sun Chart software

<sup>7</sup> Glare Analysis (Calipatria I, Midway I, and Midway II), 2011.

certain times of the day an observer would have a view of an indirect reflection, the relative intensity of the reflection would not be significant or a concern.<sup>8</sup>

#### *Comparison of Fixed Mount and Single-Axis Tracking Mount Panels*

At midday on the summer solstice solar panels, either fixed mount or single-axis tracking mounts, will be facing the same direction and likely to produce their lowest angle reflection of the year. At other times of the year, as the Good Company study states, the angles of reflection would be higher and as such the height of direct reflection would increase as compared to the summer solstice.

Additionally, the project developer has proposed to construct a 8-foot chain link fence around the perimeter of the project, which will somewhat soften the peripheral view of the project (and any indirect reflection) for drivers traveling past the project.

In summary, direct or indirect glare impacts from either ground mounted fixed tilt or single axis tracking mounted panels are **not anticipated to be significant to viewers at ground level. Lighting for service and security areas is not anticipated to be a substantial source of light or glare.**

### **5.3.5 CONSISTENCY WITH APPLICABLE POLICIES & PLANNING DOCUMENTS (GUIDELINE 5)**

#### **5.3.5.1 Imperial County General Plan**

The Imperial County General Plan is a broad-based planning document that contains text, maps, and diagrams explaining the County's long-range growth and development goals and policies. The adopted General Plan contains the Renewable Energy and Transmission Element which contains policies related to visual resources.

#### *Renewable Energy and Transmission Element*

This Element addresses the potential impacts associated with renewable energy to existing visual character and quality, including scenic vistas, natural environment and existing landscape, general built environment and historic buildings, and scenic highways. In addition, the Element identifies the potential for Renewable energy facilities to create new sources of substantial light or glare which would adversely affect day or nighttime views in the area.

### **E. Implementation Standards**

#### **3. Environmental**

---

<sup>8</sup> Ibid.

*The design, siting, and operation of renewable energy facilities shall give adequate consideration to potential direct and indirect environmental impacts pursuant to the California Environmental Quality Act related to aesthetics.*

*Analysis:*

The project, as proposed, ties into existing transmission lines located within a designated utility corridor and will contain improvements substantially similar to those that exist in the immediate vicinity, with regard to site coverage, architecture and design. While industrial buildings 30'-60' in height, and storage tanks to 50' in height, are proposed, these structures will be partially screened by the berms and vegetation lining the Westside Main Canal, other surrounding vegetation and structures, and will be viewed in relative to the large scale, visually dominant overhead utilities that exist in the immediate area. As such, improvements will appear consistent and a part of those that currently exist, minimizing adverse aesthetic impacts by relating to existing man-made improvements in view. While changes to the visual environment will occur as a result of project implementation, contrast will be reduced, and views toward major landforms preserved, and impacts to existing visual character and quality minimized. New sources of light and glare are not anticipated to adversely affect the day or nighttime views in the area. **The project will therefore be consistent with General Plan policies related to renewable energy and transmission.**

### **5.3.5.2 Zoning Ordinance**

The Imperial County Zoning Ordinance provides detailed regulatory provisions for development of all lands within the county. County zoning is used to implement the goals and objectives of the adopted General Plan in accordance with state law, which requires that the General Plan and corresponding zoning be consistent with one another. The project site is currently zoned A-3 (Heavy Agriculture). The project proposes a General Plan Amendment and Rezone to change the land use designation and zoning for the project site from Heavy Agriculture (A3) to Industrial. **The project will be in compliance with underlying Zoning upon approval of a General Plan Amendment and Rezone.**

## **5.4 Cumulative Visual Impacts**

Cumulative impacts are those resulting from the combination of two or more individual effects; either (1) within a single project or (2) from a combination of multiple projects. Projects contributing to cumulative visual effects (including the proposed project) include those within the project viewshed. The viewshed encompasses the area within which the viewer is most likely to observe both the project and surrounding community uses.

Cumulatively considerable projects include those shown on the most current Imperial County Solar Farm Projects – South End Projects Map, provided as Figure 21. It includes the following projects presented in Table 2:

**TABLE 2  
CUMULATIVE PROJECT LIST**

	<b>Project Name</b>	<b>Description</b>
1	Imperial Solar West	1,130 Acres – Under Construction
2	Ocotillo Sol	100 Acres – Approved, not built
3	Centinella Solar	422 Acres – Approved, not built
4	Wisteria Ranch Solar Energy Center	2,330 Acres – Phase 1 built; Phase 2 approved, not built
5	Drew Solar, LLC	762 Acres – Pending Entitlement
6	Vega SES	574 Acres – Pending Entitlement
7	Big Rock Cluster (Big Rock Solar)	1,380 Acres - Approved, not built

These projects, within the project viewshed, will combine with the proposed project and change the composition of the visual environment as the area transitions from agriculture to one that includes a greater number of green energy projects. This will result in physical changes that would affect the viewshed, but it is not anticipated that these changes will be significant.

The project, therefore, in conjunction with cumulatively considerable projects, **would not significantly alter the composition of the visual environment and would therefore not result in cumulatively significant adverse visual impacts.**

## 6.0 Visual Mitigation and Design Considerations

While impacts would be less than significant, and no mitigation is required, this conclusion assumes the project would be utilizing non-reflective, light, earth-toned colors and materials. This will enable the project to relate to, and minimize contrast with, the surrounding natural and man-made visual environment.

# **APPENDIX B – AESTHETIC AND VISUAL RESOURCES**

## **B.2. Solar Glare Hazard Analysis**

# Solar Glare Hazard Analysis: Westside Canal Battery Storage Project

**To:** RECON Environmental, Inc.: Michael Page and Nick Larkin

**Date:** May 2020

**From:** Good Company: Justin Overdevest and Joshua Proudfoot

## KEY FINDINGS

- **Short windows of glare:** Glare could occur from March through October for short periods of time (approximately 5-20 minutes) during morning and evening hours with most sites experiencing low or no glare. The intensity of the glare is low to moderate, never extensive or dangerous.
- **Assessed multiple observation points:** Strategically placed Key Observation Points (KOPs) were analyzed surrounding the site, with only five of the 18 points showing potential for glare.
- **No dwellings or commercial structures are affected:** Only auxiliary gravel roads, agricultural areas, and electrical lines indicated potential for glare.
- **Taller building design more of a challenge:** The potential for glare is highest with the 50-foot building height, 25-degree panel tilt roof-mount array option, with generally higher glare anticipated from the 25-degree tilt over 10-degree tilt.
- **No impact on adjacent sensitive sites:** There is no airport/runway glare predicted at Imperial County Airport nor the nearby U.S. Naval Air Facility. There is no glare at either Air Traffic Control Tower (ATCT). There is no glare predicted at the nearby Imperial Valley substation.

## PROJECT DESCRIPTION

RECON hired Good Company to evaluate the potential for glare from the proposed Westside Canal Battery Storage (project) located in Imperial County, CA to surrounding ground-level key observation points (KOPs). The KOPs assessed include roads, agricultural areas, utility sites, and surrounding air strips including flight approaches and take offs.

Consolidated Edison Development, Inc. (CED) is proposing to develop, design, construct, own, operate, and maintain the CED Westside Canal Battery Storage Project (project), a utility-scale energy storage complex with a capacity of up to 2,000 megawatts (MW). The project would store energy generation from the electrical grid, and optimally discharge that energy back into the grid as firm, reliable generation and/or grid services.

The project would be comprised of lithium-ion battery and/or flow battery energy storage facilities, a behind-the-meter solar energy facility, a new on-site 230 kilovolt (kV) loop-in switching station, a 34.5kV to 230kV substation, underground electrical cables, and permanent

vehicular access to and from the site over a proposed bridge spanning Imperial Irrigation District's (IID's) Westside Main Canal. The proposed loop-in switching station would connect the project to the existing IID Campo Verde-Imperial Valley 230 kV radial gen-tie line, which connects to the Imperial Valley Substation (IV Substation) and the California Independent System Operator (CAISO), approximately one-third mile south of the project site. CED has submitted the necessary Interconnection Request Applications to the CAISO and IID.

The project would complement both the existing operational renewable energy facilities, as well as those planned for future development in the County, and would support the broader Southern California bulk electric transmission system by serving as a firm, dispatchable resource.

The project would be constructed in three to five phases over a 10-year period, with each phase ranging from approximately 25 MW up to 400 MW per phase. Depending on the size of the battery system for a given phase, construction and commissioning (approval to operate) is anticipated to take approximately 6 to 12 months. For the purposes of this analysis, the applicant has assumed that construction activities would last for approximately 32 months to complete the full project build-out.

Construction of the 100- to 200- MW first phase would include roads, a permanent clear-span bridge across the Westside Main Canal, the Operations and Maintenance (O&M) facilities, water connections and water-mains, storm water retention, switching station and project substation, legal permanent vehicle access, as well as the first energy storage facility. To access the project site, construction workers would travel along Interstate 8 (I-8) and head 4.6 miles south to the project site, and would utilize the IID Fern Check Bridge as a pedestrian bridge until the permanent bridge is constructed. During peak construction activities, approximately 200 workers and approximately 30 daily deliveries would be required. If approved, it is anticipated that construction of the first phase would begin in 2021.

It is anticipated that each subsequent phase would be constructed within one to two years of each other, with the timing and size of each phase dependent on market conditions and the applicant's ability to secure commercial contracts with prospective customers. With the project being built in phases, the necessary infrastructure, such as water mains, retention ponds, and access roads, would be built out to serve the project phases from west to east and expanded over time to serve each phase. These subsequent phases would require improvements such as additional substation equipment, water main and site road extension, but would not require construction of additional common facilities which would be completed during the first phase. The total nameplate (or rated capacity) capacity of the project at full build-out (all phases completed) would be approximately 2,000 MW.

Construction activities during all project phases would only occur Monday through Friday, between the hours of 7:00 a.m. and 7:00 p.m. or Saturday between the hours of 9:00 a.m. and 5:00 p.m., excluding holidays, per County Ordinance.

On-site photovoltaic (PV) solar generation will serve as station auxiliary power and be deployed throughout the project site, constructed during each phase. Each PV module would be constructed out of a poly-crystalline silicon semiconductor material encapsulated in glass, in which the PV effect would allow the electrons to flow through that material to produce electricity. The PV modules will be organized into electrical groups referred to as an array. Arrays can be mounted on a rooftop, on a motionless ground-mounted steel structure, or a rotating PV tracker. For a fixed ground mount or tracker, each array will encompass 5-8 or more acres of PV panels (producing at least 1 MWAC or more) and include at least one DC to AC inverter. Construction would include installation of mounting posts, module rail assemblies, PV modules, inverters, transformers and buried electrical conductors. Concrete would be required for the footings, foundations and pads for the transformers and substation work. Tracker foundations would be comprised of either driven or vibrated steel posts/pipes, and/or concrete in some places (depending on soil and underground conditions).

Roof mounted arrays will be set approximately 6-24" above the roof surface, and anchored to the building structure with a ballasted assembly, or a bolt and rail system. The size of each array will depend upon the capacity of the associated inverters, which in turn will depend upon the type and size of inverters available for purchase and other related electrical design considerations. Conductors will extend from the PV panels to the inverter(s) via a cable management system either underground or aboveground. The output of the inverter(s) will be connected to a transformer (if needed), to match the voltage at the point of interconnection (480V, 34.5kV, etc.). The interconnection point will be behind the on-site service meter. The transformers will connect to the system auxiliary load with an above ground or underground cable management system, such as overhead power lines, conduit, direct burial cables, etc.

## PROJECT LOCATION

The project would be located in the unincorporated Mount Signal area of the County, approximately 8.0 miles southwest of the city of El Centro and approximately 5.3 miles north of the U.S.-Mexico border. The project site is comprised of two parcels owned by CED, Assessor Parcel Number (APN) 051-350-010 and APN 051-350-011, totaling approximately 148 acres. These parcels have limited access corridors for vehicular traffic and are considered less desirable for agricultural production, as reflected by the last 15 years during which no farming activity has occurred.

The project site is approximately one-third mile north of the IV Substation and directly south of the intersection of Liebert Road and the IID's Westside Main Canal. The project site is bounded by the Westside Main Canal to the north, Bureau of Land Management lands to the south and west, and vacant private land to the east. The Campo Verde solar generation facility

is located north of the project site, across the Westside Main Canal. Figure 2 shows the project site on a U.S. Geological Survey Map. Figure 3a shows an aerial photograph of the project site and the above-mentioned nearby facilities.

The two project parcels are proposed for development as a utility-scale energy storage complex. The project would also utilize portions of two parcels located north of the Westside Main Canal (APN 051-350-019 owned by IID and APN 051-350-018 owned by a private land owner) for site access and as a temporary construction staging area. The project would also access a small portion of APN 051-350-009 within an IID easement for connection to the existing IID Campo Verde Imperial Valley 230 kV radial gen-tie line during the construction of a substation on the project site. The total proposed project development footprint, encompassing both temporary and permanent impacts, would be 163.32 acres.

## METHODOLOGY

The purpose of a glare analysis is to assess the potential impact of glare from PV modules and other components as a potential hazard or distraction for motorists, nearby residences, commercial and agriculture facilities, airports and approaching airplanes. Glare is a common phenomenon that originates from the reflection of a light source (usually the sun) off any reflective surface (e.g., windows, chrome automobile bumpers, water, etc.).

The methodology for the analysis consists of two parts: 1) identifying the observational points of concern ("key observation points," or KOPs) around the project site, and 2) conducting the calculations necessary to determine if the observational points of concern intersect with the angles of light reflection, resulting in glare.

RECON provided the location of the project site and we selected points of concern and KOPs using Google Maps. For the Westside Canal project site, our team identified adjacent road intersections, residential and agricultural structures, and regional air strips. Airport analyses include air traffic control towers and approaching flight paths and pilot visibility.

The calculations in this analysis are based on the Solar Glare Hazard Analysis Tool (SGHAT) methodology and tool, developed by Sandia National Laboratory for the U.S. Department of Energy. This subscription-based online tool is built on a Google Maps platform and allows assessment for potential solar glare hazard based on multiple variables including: panel elevations, observation points, panel tilt, panel orientation, reflectivity, peak direct normal irradiance and ocular measurements. The following points describe the main variables adjusted for this analysis:

- **Panel elevation:** refers to the height of the panels. To account for multiple architectural design options being considered by the development team, models were run at 5 ft., 20 ft., 30 ft., 40 ft., and 50 ft.

- **Panel orientation:** refers to the direction the panel is facing. Orientation is expressed in degrees off of due north. For example, 90° represents due east, whereas 180° is due south and 270° is due west. Models were run for 180°, facing due south.
- **Panel tilt:** angle of the panels. To account for multiple options, models for these fixed-tilt panels were run at 10° and 25° off horizontal.
- **Reflectivity:** refers to the amount of light reflected. This variable can be manually set or variable depending on glass surface texture and the presence of anti-reflective coatings (ARC).
- **Observation Height:** refers to the height of each KOP used for calculating glare. A height of five feet is used to compare to ground level observers either standing or driving vehicles. No multi-story structures are located adjacent to the site.
- **ATCT observation height:** refers to the height of Air Traffic Control Tower. KOPs for ATCTs were set at 100 ft.

The SGHAT tool's output provides a finding of whether or not the potential for glare exists as a result of the angle of reflected light reaching a particular observation point and the related intensity of the glare. The tool calculates the angle reflection for all hours of the day and all days of the year based on the changing azimuth<sup>1</sup> of the sun.

For approaching airplanes to designated runways, SGHAT calculates glare every quarter mile beginning at the threshold (beginning of runway) to two miles out. Flight path heights of each quarter mile point are calculated based on the threshold height above ground, glide slope and threshold elevation.

SGHAT has become the *de facto* option for solar glare hazard analysis due to its ease of use, powerful analytical abilities and design pedigree and acceptance by such organizations as the Federal Aviation Administration (FAA). ***Good Company's analysis is wholly dependent on the information provided by the developer client, RECON and the abilities and limits of the SGHAT tool.***

## DEFINING SOLAR GLARE HAZARD

Glare can be described as a continuous source of excessive brightness.<sup>2</sup> Glare, and its effect on vision, is not a simple measurement because the effect of glare depends on a number of

<sup>1</sup> Azimuth is the horizontal direction expressed as the angular distance between the direction of a fixed point (as the observer's heading) and the direction of the object. This word is being used here to describe the arc of the sun in the sky as it changes with the seasons (i.e. higher arc in the summer and lower in winter).

<sup>2</sup> Ho and Khalsa. 2011. *Summary of Impact Analyses of Renewable Energy Technologies on Aviation and Airports*. Sandia National Laboratories. Retrieved October 30, 2013 at [https://share.sandia.gov/phlux/static/references/glint-glare/SGHAT\\_Ho.pdf](https://share.sandia.gov/phlux/static/references/glint-glare/SGHAT_Ho.pdf)

factors including the source radiance, source angle, duration of exposure, wavelength, pupil diameter and eye focal length.

Retinal irradiance ( $\text{W}/\text{cm}^2$  – watts per  $\text{cm}^2$ ) and subtended source angle (mrad) are the two main factors used to assess impact on the human eye. Retinal irradiance calculates the total power of the light entering the pupil and the retinal image area. Subtended source angle is calculated using the light source size, distance and focal length. These two factors are shown as axes of Figure 1, which maps the potential ocular impacts and thresholds for each of the three bands of potential hazard from available research on the subject.

**Source: Solar Glare Hazard Analysis Tool (SGHAT, 2018)** <https://share-ng.sandia.gov/glare-tools/>

After-image experiences (green and yellow bands in Figure 1 above) vary broadly and are commonly described as flash blindness, which results from bright sources of light bleaching retinal visual pigments. Commonly, yellow can mean caution, and in some instances potential for after-image can infer caution such as when directly viewing the sun (a point labeled in Figure 1). However, when considering the results of the SGHAT tool, it is important to remember that the yellow band describes a range of effects, not a single point or single effect. Experiencing after-image potential is common. Examples of after-image potential include the eye's reaction to a flash bulb or a light being turned on in a dark room. The red band is not applicable to this analysis, as PV or CPV panels are not capable of creating the conditions that would cause permanent eye damage.

This technical definition of glare is provided to the reader as background information because the SGHAT tool uses calculated values for *retinal irradiance* and *subtended source angle*, and the same colors used in Figure 1, to describe the intensity of glare in the results. Figure 2 provides an example of the one output from the SGHAT tool. The yellow line shows the timing, duration and intensity of glare (yellow = potential for temporary after image). Data from the tool may also be downloaded as a text file.

**Figure 2: Example of SGHAT Results Graphic**

**Source:** Solar Glare Hazard Analysis Tool (SGHAT, 2018) <https://share-ng.sandia.gov/glare-tools/>

**Note:** This image is not a result from this study. No pilot line-of-sight glare was found during this analysis.

## ANALYSIS

The project analysis consisted of 18 key observation points (KOPs) representing road, utility, and agricultural sites. No commercial or residential sites were present. Two airplane runways were analyzed: Imperial County Airport (11 miles northeast of the site) and U.S. Naval Air Facility El Centro (7 miles north-northeast of the site). The topography gradually slopes upward to the south and west, becoming steeper in the southwest.

This glare analysis was run for flat-plate fixed-axis PV modules (or panels) with a fixed tilt of either 10° or 25° off horizontal facing due south (180°). A fixed-axis solar panel will reflect some light based on the angle of the sun relative to the surface of the panel. Panel reflectivity was assessed with SGHAT tool using an assumed smooth glass panel with anti-reflective coating (ARC) with SGHAT varying the reflectivity based on angle of sun incidence. Generally, smooth glass panels with ARC have a reflectivity of 2%. When the sun is closer to the horizon during sunrise and sunset, it will be reflected in the opposite direction at glancing angles (angles greater than 60°). Because the sun is so low in the sky during these times of the day, it is at these times that the likelihood for glare to be an issue at ground level is the greatest for ground-level observation points. At large glancing angles, reflectivity for PV modules can be 20% or more, even with texturing and anti-glare coatings.<sup>3</sup> Heights of 5 feet, 20 feet, 30 feet, 40 feet, and 50 feet were analyzed to allow for multiple architectural possibilities of both ground-mounted and rooftop arrays, with panel tilts of both 10 degrees and 25 degrees.

The 115-acre site was defined as having a combination of solar PV and battery storage coverage. Total spatial PV coverage was used based on the site boundaries provided by the solar developer client to assess all options.

Roads, structures and agricultural lands that are near the site were selected as KOPs. A substation to the south and an electrical power line were also selected in case of personnel performing work at either location. An observation height of five feet is used and is

**Figure 3: Examples of large roof-mounted and ground-mounted solar PV arrays.**

<sup>3</sup> Ho, C. April 2013. Relieving a Glaring Problem, Solar Today  
[https://share.sandia.gov/phlux/static/references/glint-glare/Ho-SolarToday-April13\\_v2.pdf](https://share.sandia.gov/phlux/static/references/glint-glare/Ho-SolarToday-April13_v2.pdf)

representative of sitting near first story windows and car windows. No multi-story buildings appeared to be present based on satellite imagery available from the SGHAT tool.

The airport analysis consists of a KOP at each site representing an air traffic control tower and flight paths of approaching flights out to two miles. The regional airport is 11 miles northeast of the PV site and the flight approaches are from the southeast/northwest (152°/332°) and east/west (90°/270°). The nearby U.S. Naval Facility is seven miles north-northeast of the PV site and the flight approaches are from southeast/northwest (135°/315°) and east/west (90°/270°). The flight path approaches take into account the pilot's line-of-sight.

## SITEWIDE RESULTS

All options assumed 180° orientation (due south) and a KOP observation height of five feet. The analysis estimated 5-20 minutes of glare per day during select months – see Results by KOP section for details. For reference, there are **525,600 minutes in one year.**

Green blocks represent number of minutes in one year of “low potential to cause temporary after-image” per the SGHAT tool. Yellow blocks represent number of minutes in one year of “potential to cause temporary after-image” per the SGHAT tool. See Individual KOP Results section for details.

**Figure 4: Summary of Glare Results for the Westside Canal Project 1 (minutes per year)**

Figure 6: Conceptual Site Layout of the Westside Canal Battery Storage Complex

Potential for after-image was detected at five of the 18 KOPs representing select roads, agricultural sites, and structures with anticipated human activity (see bold items below). KOP sites are as follows (see Figure 7):

1. Nearby electrical utility facility, north of the site
2. **Nearby built facility on the irrigation canal, north of the site**
  - a. Project 1: glare detected at all panel heights
  - b. Project 2: glare detected at ground-level and 20ft panel heights
3. **Corner of Mandrapa Road and Fig Drain, east of the site**
  - a. Project 1: glare detected at all panel heights
  - b. Project 2: glare detected at all panel heights
4. Nearby electrical substation, south of the site
5. Agricultural site/dirt road west of Mandrapa Road and Lyons Road, southeast of the site
6. **Corner of Mandrapa Road and Lyons Road, southeast of the site**
  - a. Project 1: glare detected at all panel heights
  - b. Project 2: glare detected at all panel heights
7. Agricultural site/dirt road west of Mandrapa Road, southeast of the site
8. Highway 98/Yuha Cutoff – a section of road west of Tom’s Hay Farm, south-southeast of the site
9. Highway 98/Yuha Cutoff, south of the site
10. Highway 98/Yuha Cutoff, southwest of the site
11. Highway 98/Yuha Cutoff, southwest of the site
12. A residential structure on the south side of the irrigation canal near Mandrapa Road, northwest of the site
13. Westside Road at the corner of a solar array installation, northwest of the site
14. A residence near Fern Canal south of Diehl Road, north of the site
15. A residence near Liebert Road and Wixom Road, north of the site
16. A residence near Wixom Road and Vogel Road, northeast of the site
17. **A utility pole (no other structures), southwest of the site**
  - a. Project 1: glare detected at all panel heights
  - b. Project 2: glare detected at all panel heights
18. **A nearby structure (aerial views indicate that the structure may be abandoned or used only for storage), north of the site**
  - a. Project 1: glare detected at all panel heights
  - b. Project 2: glare detected at 20ft, 30ft, 40ft, and 50ft panel heights

In addition to the 18 regular KOPs, two air facilities, their runway flight paths, and air traffic control towers (ATCT) were analyzed. The ATCTs will be listed as KOPs in the SGHAT reports.

19. US Naval Base El Centro, runway flight path, and ATCT (100 ft), north of the site
20. Imperial County Airport, runway flight path, and ATCT (100 ft), northeast of the site

Figure 7: Map showing site and all KOPs

Figure 8: Map showing site, majority of KOPs, and both airport facilities

Potential for glare exists from March to October for all panel heights and tilt angles. The potential for after-image is present only for short periods of time (5 – 20 minutes) in the morning or evening. Details for months of the year and time of day are available in detailed Results by KOP section.

## RESULTS BY KOP

This section provides more detailed information on the potential impacts to affected KOPs. KOPs that have no anticipated glare are not included (other than airports) but can be reviewed in the Appendices.

### Assumptions by the SGHAT tool:

- Times associated with glare are denoted in Standard time. For Daylight Savings, add one hour.
- Glare analyses do not account for physical obstructions between reflectors and receptors. This includes buildings, tree cover and geographic obstructions.
- Detailed system geometry is not rigorously simulated.
- The glare hazard determination relies on several approximations including observer eye characteristics, angle of view, and typical blink response time. Actual values and results may vary.
- Several calculations utilize the PV array centroid, rather than the actual glare spot location, due to algorithm limitations. This may affect results for large PV footprints. Additional analyses of array sub-sections can provide additional information on expected glare.
- The subtended source angle (glare spot size) is constrained by the PV array footprint size. Partitioning large arrays into smaller sections will reduce the maximum potential subtended angle, potentially impacting results if actual glare spots are larger than the sub-array size. Additional analyses of the combined area of adjacent sub-arrays can provide more information on potential glare hazards. (See previous point on related limitations.)
- Hazard zone boundaries shown in the Glare Hazard plot are an approximation and visual aid. Actual ocular impact outcomes encompass a continuous, not discrete, spectrum.
- Glare locations displayed on receptor plots are approximate. Actual glare-spot locations may differ.
- Glare vector plots are simplified representations of analysis data. Actual glare emanations and results may differ.
- Refer to the [User's Manual](#) for assumptions and limitations not listed here.

### How to read the results:

- **Satellite images:** All images courtesy of satellite imagery from the SGHAT tool.
- **Description:** Brief description of the location of the KOP.
- **Table results:** These tables describe analysis results for individual KOP with all scenarios, by project, in minutes per year.
  - Green blocks represent number of minutes in one year of "low potential to cause temporary after-image" per the SGHAT tool.

- Yellow blocks represent number of minutes in one year of “potential to cause temporary after-image” per the SGHAT tool. See individual KOP results for details.
- **Impacts:** Brief description of severity and timing of anticipated glare.
- **Sample details:** Four graphics from the reports were selected for detailed review, including annual predicted glare occurrence, daily duration of glare, glare reflection on PV footprint, and hazard plot. Only the most impactful scenario was selected. All scenarios can be viewed in Appendices. Explanation of how to read the graphics using the sample details from KOP 2:
  - Green colors represent “low potential to cause temporary after-image”
  - Yellow colors represent “potential to cause temporary after-image”
  - **Annual predicted glare occurrence:** This graphic explains what time of year that glare is anticipated, as well as what time of day. The following graphic shows that glare is anticipated to occur approximately between 6pm and 7pm, from mid-February to end of March, and mid-September to end of October. Keep in mind that times associated with glare are denoted in Standard time. For Daylight Savings, add one hour.

- **Daily duration of glare:** This graphic explains how many minutes per day of glare is expected for a given day of the year. The following graphic shows that glare is anticipated to occur for approximately 1-15 minutes per day, starting in mid-February, peaking at 15 minutes per day in March, and ending at the end of March. Glare is also predicted for 1-15 minutes starting in mid-September, peaking at 15 minutes per day at the end of September, and ending at the end of October.

- **Glare reflection on PV footprint:** This graphic outlines the project site and shows where glare is coming from. The following graphic has glare reflecting only from the far northwest corner of the site. Graphics will show either an outline of Project 1 or Project 2 (not both) depending on which scenario had stronger glare.

- **Hazard plot:** This graphic shows the hazard of the glare to the human eye. Glare from the site is mapped in orange circles, with a mapped yellow and blue circle representing direct viewing of unfiltered sun by comparison. For details explaining the components of this graphic, please see the *Defining Solar Glare* section of the methodology chapter of this report. Note: no scenario yielded permanent retinal damage.

## Glare results for Key Observation Point 2:

Figure 12: KOP detail and context maps.

**Description:** KOP 2 is located north and adjacent to the site, on an existing bridge and facility on the water channel. This facility does not appear to be frequently visited.

Figure 13: analysis results for individual KOP with all scenarios, by project, in minutes per year.

**Impacts:** Low impact with less than 15 minutes of glare in the evenings during spring and fall months.

Sample details:

Detailed annual predicted glare occurrence, daily duration of glare, glare reflection on PV footprint, and hazard plot from highest glare scenario.

**Figure 15: Project 2, Ground-mount at 10-degree tilt**

**Project 2 - OP Receptor (OP 2)**

PV array is expected to produce the following glare for receptors at this location:

- 0 minutes of "green" glare with low potential to cause temporary after-image.
- 644 minutes of "yellow" glare with potential to cause temporary after-image.

## Glare results for Key Observation Point 3:

Figure 16: KOP detail and context maps.

**Description:** KOP 3 is located east of the site on the intersection of Mandrapa Road and Fig Drain, near agricultural land. No structures nearby.

Figure 17: analysis results for individual KOP with all scenarios, by project, in minutes per year.

PROJECT 1	10-degree tilt		25-degree tilt

30 ft	3	885	2	1601
40 ft	5	757	3	1740
50 ft	5	963	5	1888

**Impacts:** Moderate impact with less than 20 minutes of glare in the evenings during spring through fall months.

Sample details:

Detailed annual predicted glare occurrence, daily duration of glare, glare reflection on PV footprint, and hazard plot from highest glare scenario.

**Figure 19: Project 2, 50-foot roof mount at 25-degree tilt**

**Project 2 - OP Receptor (OP 3)**

PV array is expected to produce the following glare for receptors at this location:

- 5 minutes of "green" glare with low potential to cause temporary after-image.
- 1,888 minutes of "yellow" glare with potential to cause temporary after-image.

## Glare results for Key Observation Point 6:

Figure 20: KOP detail and context maps.

**Description:** KOP 6 is located southeast of the site, on the intersection of Mandrapa Road and Lyons Road, near agricultural land. No structures nearby.

## 1.0 Introduction

As stated in Appendix G of the California Environmental Quality Act (CEQA) Guidelines, the Land Evaluation and Site Assessment (LESA) model is intended to provide lead agencies with an optional methodology to ensure significant effects on the environment of agricultural land conversion are quantitatively and consistently considered in the environmental review process. The model provides an approach for rating the relative quality of land resources using a point-based evaluation composed of six different factors. Land Evaluation factors are based upon measures of soil resource quality including Land Capability Classification (LCC) and Storie Index, while Site Assessment factors are evaluated based on a project's size, water resource availability, surrounding agricultural lands, and surrounding protected resource lands. For a given project, each of these factors is rated on a 100-point scale. Each factor has relative weights that are combined into one numeric score. That score is then evaluated against the scoring thresholds provided in the LESA Model instruction manual. The project's LESA model score is used to make a determination of the potential significance of the conversion of agricultural lands (California Department of Conservation 1997).

The following LESA Model was prepared for the proposed Westside Canal Battery Storage Project (Project), and the results are provided below.

## 2.0 Project Description

Westside Canal Battery Storage, LLC (Project Proponent), a subsidiary of Con Edison Clean Energy Businesses is proposing to develop, design, construct, own, operate, and maintain the Westside Canal Battery Storage Project (Project), a utility-scale energy storage complex with a capacity of up to 2,000 megawatts (MW). The Project would store energy generation from the electrical grid, and optimally discharge that energy back into the grid as firm, reliable generation and/or grid services.

The Project would be comprised of lithium-ion battery and/or flow battery energy storage facilities, a behind-the-meter solar energy facility, a new on-site 230 kilovolt (kV) loop-in switching station, a 34.5 kV to 230 kV substation, underground electrical cables, and permanent vehicular access to and from the site over a proposed bridge spanning Imperial Irrigation District's (IID's) Westside Main Canal. The proposed loop-in switching station would connect the Project to the existing IID Campo Verde-Imperial Valley 230 kV radial gen-tie line, which connects to the Imperial Valley Substation (IV Substation) and the California Independent System Operator (CAISO), approximately one-third mile south of the Project site. The Project Proponent has submitted the necessary Interconnection Request Applications to the CAISO and IID.

The Project would complement both the existing operational renewable energy facilities, as well as those planned for future development in the County, and would support the broader Southern California bulk electric transmission system by serving as a firm, dispatchable resource.

The Project is pursuing the following objectives:

- To receive grid energy during beneficial market and operational periods and store that energy for future dispatch when the customer (i.e., a load-serving entity) deems it to be more valuable.
- To be a valuable resource in allowing the customer and system operators to manage the effect of intermittent renewable generation on the grid and create reliable, dispatchable generation upon demand.
- To utilize available land that has not been used for agricultural production for more than 15 years and enhance the site location by providing for permanent vehicular access.

## **2.1 Environmental Setting**

The Project site was previously graded and used as farmland and has been fallow for more than 15 years. The General Plan land use designation and zoning for the Project site and all surrounding parcels to the north and east is Agriculture (A3). The General Plan land use designation for parcels to the south and west are designated open space/recreation areas; zoning does not apply to these Bureau of Land Management (BLM) lands. The Campo Verde solar generation facility is located north of the Project site and agricultural uses are located northeast of the Project site. Parcels farther north of the Project site also include a mix of agricultural uses and solar generation facilities. The parcel immediately east of the Project site is undeveloped. BLM land south and west of the Project site is generally undeveloped, relatively flat, and barren. The IV Substation is located approximately one-third mile south of the southern property line of the site.

## **2.2 Project Characteristics**

### **2.2.1 Project Location**

The Project would be located in the unincorporated Mount Signal area of the County, approximately 8.0 miles southwest of the city of El Centro and approximately 5.3 miles north of the U.S.-Mexico border. Figure 1 shows the regional location of the Project. The Project site is comprised of two parcels owned by the Project Proponent, Assessor Parcel Number (APN) 051-350-010 and APN 051-350-011, totaling approximately 148 acres. These parcels have limited access corridors for vehicular traffic and are considered less desirable for agricultural production, as reflected by the last 15 years during which no farming activity has occurred.

✱ Project Location

FIGURE 1  
Regional Location

The Project site is approximately one-third mile north of the IV Substation and directly south of the intersection of Liebert Road and the IID's Westside Main Canal. The Project site is bounded by the Westside Main Canal to the north, BLM lands to the south and west, and vacant private land to the east. The Campo Verde solar generation facility is located north of the Project site, across the Westside Main Canal. Figure 2 shows the Project site on a U.S. Geological Survey Map. Figure 3a shows an aerial photograph of the Project site and the above-mentioned nearby facilities.

The two Project parcels are proposed for development as a utility-scale energy storage complex. The Project would also utilize portions of two parcels located north of the Westside Main Canal (APN 051-350-019 owned by IID and APN 051-350-018 owned by a private land owner) for site access and as a temporary construction staging area. The Project would also access a small portion of APN 051-350-009 within an IID easement for connection to the existing IID Campo Verde Imperial Valley 230 kV radial gen-tie line during the construction of a substation on the Project site. The total proposed Project development footprint, encompassing both temporary and permanent impacts, would be approximately 163 acres.

## **2.2.2 Project Components**

The Project would be constructed in three to five phases over a 10-year period, with each phase ranging from approximately 25 MW up to 400 MW per phase. Depending on the size of the battery system for a given phase, construction and commissioning (approval to operate) is anticipated to take approximately 6 to 12 months. For the purposes of this analysis, the applicant has assumed that construction activities would last for approximately 32 months to complete the full Project build-out.

Construction of the 100- to 200- MW first phase would include roads, a permanent clear-span bridge across the Westside Main Canal, Operations and Maintenance (O&M) facilities, water connections and water-mains, storm water retention, switching station and Project substation, legal permanent vehicle access, as well as the first energy storage facility. To access the Project site, construction workers would travel along Interstate 8 (I-8) and head 4.6 miles south to the Project site, and would utilize the IID Fern Check Bridge as a temporary pedestrian bridge until the permanent bridge is constructed. During peak construction activities, approximately 200 workers and approximately 30 daily deliveries would be required. It is anticipated that construction of the first phase would begin in 2021.

It is anticipated that each subsequent phase would be constructed within one to two years of each other, with the timing and size of each phase dependent on market conditions and the applicant's ability to secure commercial contracts with prospective customers. With the Project being built in phases, the necessary infrastructure, such as water mains, retention ponds, and access roads, would be built out to serve the Project phases from west to east and expanded over time to serve each phase. These subsequent phases would require improvements such as additional substation equipment, water main and site road extension, but would not require construction of additional common facilities which would be completed during the first phase. The total nameplate capacity (or rated capacity) of the Project at full build-out (all phases completed) would be approximately 2,000 MW. On-site photovoltaic solar generation would serve as station auxiliary power and be deployed throughout the Project site, constructed during each phase.

 Project Boundary

FIGURE 2  
Project Location on USGS Map

PC ORIGINAL PKG

 Project Boundary

FIGURE 3a  
Project Location on  
Aerial Photograph

Construction activities during all Project phases would only occur Monday through Friday, between the hours of 7:00 a.m. and 7:00 p.m. or Saturday between the hours of 9:00 a.m. and 5:00 p.m., excluding holidays, per County Ordinance.

Due to the Project site having no direct vehicular access routes, the applicant is proposing to construct roads on both the north and south sides of the Westside Main Canal on private land, and a new clear-span Imperial County/-specified bridge over the Westside Main Canal. The permanent new clear-span County-specified bridge would span the Westside Main Canal to connect to a proposed access road easement on the north side of the Westside Main Canal. The north side proposed access road would ultimately connect the Project to county road (CR) Liebert Road.

Construction of the permanent clear-span bridge spanning the IID's Westside Main Canal requires the Project Proponent to have access to both the north side and the south of the canal to perform the necessary construction activities. In addition to being necessary to facilitate construction of the new permanent clear-span bridge, access from the south side of the canal would allow the Project Proponent to commence construction on the first phase of the Project simultaneously, thereby shortening the duration of construction and potentially minimizing the associated impacts. The Project Proponent is evaluating various options for temporary construction access, including accessing the Project site from the south side of the Westside Main Canal off of State Route 98, as well as options involving access from the north side of the Westside Main Canal from I-8.

Option 1 would use the existing SDG&E maintenance road off Highway 98, which extends approximately 4.4 miles to the IV Substation. Option 1 would then continue along an existing 1.2-mile-long dirt access road that leads north, then east, outside the western and northern boundaries of the substation. Option 1 then continues northwest along an existing dirt access road that parallels two power lines until the access road connects with the western edge of the Project. The existing dirt road was constructed for the construction and maintenance of the existing Centinela gen-tie line. Option 2 would use the existing IID Westside Mail Canal access road. The selected temporary access option would be used until construction of the permanent bridge is completed. Both temporary construction access routes are presented in Figure 3b. Temporary use of these access routes using existing utility roads within existing utility easements would not result in any permanent impacts to land uses or soils. Therefore, an impact analysis of these temporary access routes has not been included in this LESA.

### **3.0 Land Evaluation and Site Assessment Evaluation**

The Project site was evaluated using the 1997 California LESA Model to rate the quality and availability of agricultural resources and to identify whether the Project would meet the threshold criteria as having a significant impact to Agricultural Resources under CEQA Guidelines. The LESA evaluates land use and site assessment factors to identify if the Project would result in a significant agricultural resources impact. Each LESA Model factor is evaluated in the following sections.

FIGURE 3b  
Temporary Construction Access Routes

## 3.1 Land Evaluation

The land evaluation portion of the LESA Model focuses on two components of soil quality: the LCC Rating and the Storie Index Rating.

The LCC indicates the suitability of soils for most kinds of crops. Soils are rated from Class I to Class VIII, with soils having the fewest limitations receiving the highest rating. Class I soils have no significant limitation for raising crops. Classes VI through VIII have severe limitations, limiting or precluding their use for agriculture. Capability subclasses are also assigned by adding a small letter to the class designation. Capability subclasses include the letters e, w, s, or c. The letter e shows that the main limitation is risk of erosion. The letter w indicates that water in or on the soil interferes with plant growth or cultivation. The letter s indicates that the soil is limited mainly because it is shallow, droughty, or stony. Finally, the letter c is used only in some parts of the United States where cold or dry climates are a concern. Groupings are made according to the limitation of the soils when used to grow crops and the risk of damage to soils when they are used in agriculture.

The Storie Index provides a numeric rating (based upon a 100 point scale) of the relative degree of suitability or value of a given soil for intensive agriculture use. This rating is based upon soil characteristics only (California Department of Conservation 1997). The Storie Index assesses the productivity of a soil from the following four characteristics: degree of soil profile development; texture of the surface layer; slope; and manageable features, including drainage, microrelief, fertility, acidity, erosion, and salt content. A score ranging from 0 to 100 is determined for each factor, and the scores are multiplied together to derive an index rating. For simplification, Storie Index ratings have been combined into six grade classes as follows: Grade 1 (excellent), 81 to 100; grade 2 (good), 61 to 80; grade 3 (fair), 41 to 60; grade 4 (poor), 21 to 40; grade 5 (very poor), 11 to 20; and grade 6 (nonagricultural), 10 or less (U.S. Department of Agriculture Natural Resources Conservation Service 2017).

Review of the U.S. Department of Agriculture Soil Survey Map Sheet CA683 identified the following eleven soil types on the Project site (U.S. Department of Agriculture Natural Resources Conservation Service 2013).

- Glenbar Complex
- Holtville Silty Clay, Wet
- Indio-Vint Complex
- Meloland Fine Sand
- Meloland Very Fine Sandy Loam, Wet
- Vint And Indio Very Fine Sandy Loams, Wet
- Vint Loamy Very Fine Sand, Wet
- Imperial-Glenbar Silty Clay Loams, Wet, 0-2% Slopes
- Rositas Fine Sand, Wet, 0-2% Slopes
- Rositas Fine Sand, 0-2% Slopes
- Water

Figure 4 presents the distribution of these eleven soil types on the Project site. The LESA Model assigns LCC scores to each soil by multiplying the soils' LCC Rating by the soils' proportion of the Project site. Similarly, the Storie Index score is calculated by multiplying the soils' Storie Index rating by the soils' proportion of the Project site. Table 1 presents the calculations for the Project sites' LCC and Storie Index scores, which together constitute the Project sites' Land Evaluation (LE) scores. The final LE and Site Assessment (SA) scores are entered into the Final LESA Score Sheet presented in Table 7 (see Section 4.0).

Table 1 Land Capability Classification and Storie Index Score							
A	B	C	D	E	F	G	H
Soil Map Unit	Acres	Proportion of Project Area	LCC	LCC Rating	LCC Score	Storie Index	Storie Index Score
Glenbar Complex	1.96	1.2%	IIIs	60	0.7	52	0.6
Holtville Silty Clay, Wet	0.15	0.1%	IIw	80	0.1	30	0.0

Rositas Fine Sand, 0-2% Slopes	0.16	0.1%	IIIe	70	0.1	62	0.0
Water	0.09	0.1%	N/A	0	0.0	0	0.0
<b>Total</b>	163.32	100.0%	--	<b>LCC Total</b>	<b>64.2</b>	<b>Storie Index Total</b>	<b>44.7</b>
NOTE: Totals may vary due to independent rounding. LCC = Land Capability Classification							

## 3.2 Site Assessment Factors

The California LESA Model includes four Site Assessment factors that are separately rated and include the following:

- Project Size Rating;
- Water Resources Availability Rating;
- Surrounding Agricultural Land Rating; and
- Surrounding Protected Resource Land Rating (California Department of Conservation 1997).

  Project Boundary

#### Soil Classification

- 107 - Glenbar Complex - 2.0 ac. (1.2%)
- 110 - Holtville Silty Clay, Wet - 0.2 ac. (0.1%)
- 115 - Imperial-Glenbar Silty Clay Loams, Wet, 0-2% Slopes - 23.7 ac. (14.5%)
- 119 - Indio-Vint Complex - 0.1 ac. (0.1%)

- 121 - Meloland Fine Sand - 2.0 ac. (1.2%)
- 122 - Meloland Very Fine Sandy Loam, Wet - 18.2 ac. (11.1%)
- 132 - Rositas Fine Sand, 0-2% Slopes - 0.2 ac. (0.1%)
- 135 - Rositas Fine Sand, Wet, 0-2% Slopes - 15.5 ac. (9.5%)
- 142 - Vint Loamy Very Fine Sand, Wet - 49.9 ac. (30.6%)
- 144 - Vint And Indio Very Fine Sandy Loams, Wet - 51.6 ac. (31.6%)
- 145 - Water - 0.1 ac. (0.1%)

### 3.2.1 Project Size Rating

The Project Size rating is utilized to recognize the role that farm size plays in the viability of commercial agricultural operations. In general, larger farming operations can provide greater flexibility in farm management and marketing decisions, and can benefit from certain economies of scale for equipment and infrastructure. Additionally, larger operations tend to have greater impacts upon the local economy through direct employment, as well as impacts upon supporting industries and food processing industries (California Department of Conservation 1997).

The Project Size rating considers both the total acreage of land and the different quality of land that comprise the operation when evaluating agricultural productivity. Lands with higher quality soils lend themselves to greater management and cropping flexibility and have the potential to provide greater economic return per unit acre. Table 2 shows the Project Size Rating Scores the LESA Model assigns projects based on the acreage and LCC rating of soils within the Project site. As shown in Table 2, the Project Size rating divides the Project into three acreage groupings based upon the LCC ratings that were previously determined in the LE analysis. Under the Project Size rating, relatively fewer acres of high quality soils are required to achieve a maximum Project Size score. Alternatively, a maximum score on lesser quality soils could also achieve a maximum Project Size score (California Department of Conservation 1997). As shown in Table 3, the Project is assigned the maximum Project Size score of 100 because the Project site includes over 80 acres of soils with an LCC rating of IIw and IIe.

Table 2 Project Size Rating Scores					
LCC Class I or II soils		LCC Class III soils		LCC Class IV or lower	
Acres	Score	Acres	Score	Acres	Score
80 or Above	100	160 or Above	100	320 or Above	100
60 to 79	90	120 to 159	90	240 to 319	80
40 to 59	80	80 to 119	80	160 to 239	60
20 to 39	50	60 to 79	70	100 to 159	40
10 to 19	30	40 to 59	60	40 to 99	20
Fewer than 10	0	20 to 39	30	Fewer than 40	0
--	--	10 to 19	10	--	--
--	--	Fewer than 10	0	--	--
LCC = Land Capability Classification					

**Table 3**  
**Project Size Score**

Soil Type	I	J	K
	LCC Class I–II	LCC Class III	LCC Class IV–VIII
Glenbar Complex	--	2.0	--
Holtville Silty Clay, Wet	0.2	--	--
Indio-Vint Complex	0.1	--	--
Meloland Fine Sand	--	2.0	--
Meloland Very Fine Sandy Loam, Wet	--	18.2	--
Vint And Indio Very Fine Sandy Loams, Wet	51.6	--	--
Vint Loamy Very Fine Sand, Wet	49.9	--	--
Imperial-Glenbar Silty Clay Loams, Wet, 0-2% Slopes	--	23.7	--
Rositas Fine Sand, Wet, 0-2% Slopes	--	15.5	--
Rositas Fine Sand, 0-2% Slopes	--	0.2	--
<b>Total Acres</b>	101.8	61.4	0.0
<b>Project Size Scores</b>	100	70	0
<b>Highest Project Size Score</b>		<b>100</b>	--
NOTE: Totals may vary due to independent rounding. The Project site consists of 0.1 acre of water associated with the Westside Main Canal, which is included in Table 1 and Figure 4 above. However, water does not have an LCC Class, and therefore is not included in Table 3. LCC = Land Capability Classification			

### 3.2.2 Water Resources Availability Rating

The Water Resource Availability Rating is based upon identifying the various water sources that may supply a given property, and then determining whether different restrictions in supply are likely to take place in years that are characterized as being periods of drought and non-drought (California Department of Conservation 1997).

Although the Project site has been fallow for more than a decade, the Project site could be irrigated entirely by irrigation water provided by the IID. Due to the high reliability of IID to deliver water during drought and non-drought years, and due to the presence of the Westside Main Canal immediately adjacent to the northern Project boundary, the Project has no physical or economic restrictions that could reduce the availability of water resource supply during either drought or non-drought years. Consequently, the Project site is assigned the maximum Water Resources Availability score of 100 (Table 4).

**Table 4**  
**Water Resource Availability Score**

A	B	C	D	E
Project Portion	Water Source	Proportion of Project Area	Water Availability Score	Weighted Availability Score
1	Imperial Irrigation District Irrigation Water	1.0	100	100
Total Water Resources Score				100

### 3.2.3 Surrounding Agricultural Land Rating

The Surrounding Agricultural Land Rating provides a measurement of how land near a given project, both directly adjoining and within a defined distance away, may both influence and be influenced by the agricultural land use of the subject project site. The Surrounding Agricultural Land Rating is based on identification of a project site's "Zone of Influence" (ZOI), which consists of surrounding parcels located within 0.25 mile from the project boundary. Parcels that are intersected by the 0.25-mile buffer are included in their entirety. The project site is assigned a "Surrounding Agricultural Land" score based upon the percentage of agricultural land in the ZOI. The LESA Model rates the potential significance of the conversion of an agricultural parcel that has a large proportion of surrounding land in agricultural production more highly than one that has a relatively small percentage of surrounding land in agricultural production. Table 5 shows the Surrounding Agricultural Land Rating Scores the LESA Model assigns projects based on the percentage of surrounding land in agricultural production within the ZOI (California Department of Conservation 1997).

<b>Table 5</b>	
<b>Surrounding Agricultural Land Rating Scores</b>	
<b>Percent of Project's Zone of Influence in Agricultural Use</b>	<b>Surrounding Agricultural Land Score</b>
90 to 100	100
80 to 89	90
75 to 79	80
70 to 74	70
65 to 69	60
60 to 64	50
55 to 59	40
50 to 54	30
45 to 49	20
40 to 44	10
40 <	0

RECON conducted field reconnaissance to identify active farmland within the ZOI. Figure 5 shows that land within the northeastern portion of the ZOI is currently in agricultural production, which constitutes approximately 16 percent of the ZOI. Because land currently in agricultural production constitutes approximately 16 percent of the ZOI, the Project site is assigned a Surrounding Protected Resource Land Rating score of zero.

- Project Boundary
- Envelope
- 0.25-mile Buffer of Envelope
- Zone of Influence - 3,187 ac.
- Non-Farmland - 2,664.2 ac. (84% of Total)
- Active Farmland - 522.8 ac. (16% of Total)

FIGURE 5  
Surrounding Agricultural Land

### 3.2.4 Surrounding Protected Resource Land Rating

The Surrounding Protected Resource Land Rating is essentially an extension of the Surrounding Agricultural Land Rating, and is scored in a similar manner. Protected resource lands are those lands with long-term use restrictions that are compatible with or supportive of agricultural uses of land, including the following:

- Williamson Act contracted land;
- Publicly owned lands maintained as park, forest, or watershed resources; and
- Lands with agricultural, wildlife habitat, open space, or other natural resource easements that restrict the conversion of such land to urban or industrial uses (California Department of Conservation 1997).

Table 6 shows the Surrounding Protected Resource Land Rating Scores the LESA Model assigns projects based on the percentage of protected resource lands within the ZOI. Review of California Department of Conservation, Division of Land Resource Protection, Conservation Program Support mapping data determined that there are no parcels protected by Williamson Act Contracts within the ZOI (California Department of Conservation 2017). Review of the U.S. Department of the Interior, BLM mapping data for Areas of Critical Environmental Concern (ACEC) determined that 1,880 acres of the ZOI are within the Yuha Basin ACEC (U.S. Department of the Interior 2017). This land within the Yuha Basin ACEC constitutes 59 percent of the ZOI. Search of available geographic information systems data did not yield any sources identifying easements that restrict conversion of land to urban or industrial uses. Therefore, 1,307 acres of land within the ZOI are considered unprotected (41 percent of the ZOI). The locations of protected resource land surrounding the Project site is presented in Figure 6. Based on the results of the analysis, the Project site is assigned a Surrounding Protected Resource Land Rating score of 40.

Table 6 Surrounding Protected Resource Land Rating Scores	
Percent of Project's Zone of Influence Defined as Protected	Surrounding Protected Resource Land Score
90 to 100	100
80 to 89	90
75 to 79	80
70 to 74	70
65 to 69	60
60 to 64	50
55 to 59	40
50 to 54	30
45 to 49	20
40 to 44	10
40 <	0

- Project Boundary
- Envelope
- 0.25-mile Buffer of Envelope
- Zone of Influence - 3,187 ac.
- Unprotected Land - 1,307 ac (41% of Total)
- Protected Resource Land**
- BLM Yuha Basin ACEC - 1,880 ac (59% of Total)
- Williamson Act Parcels - 0.0 ac (0% of Total)

FIGURE 6  
Surrounded Protected Resource Land

## 4.0 Summary

The LESA Model is weighted so that 50 percent of the total LESA score is derived from the LE factors, and 50 percent is derived from the SA factors. Table 7 presents the individual scores and factor weighting used to develop the final LESA score. As shown in Table 7, the LE subscore is 27.2, while the SA subscore is 32.0, resulting in a final LESA score of 59.2. As shown in Table 8, a final LESA score between 40 to 59 points is considered significant if both the LE and SA subscores are greater than or equal to 20 points. Because both subscores (LE and SA) are greater than 20, the Project is considered to have a significant impact on agricultural resources.

Table 7 Final Land Evaluation and Site Assessment Score Sheet			
A	B	C	D
Factor Name	Factor Score (0–100 Points)	Factor Weighting (Total = 1.00)	Weighted Factor Score
<b>Land Evaluation</b>			
Land Capability Classification	64.2	0.25	16.1
Storie Index Rating	44.7	0.25	11.2
Land Evaluation Subscore			27.2
<b>Site Assessment</b>			
Project Size	100	0.15	15.0
Water Resource Availability	100	0.15	15.0
Surrounding Agricultural Lands	0	0.15	0
Protected Resource Lands	40	0.05	2.0
Site Assessment Subscore			32.0
Total Land Evaluation and Site Assessment Score			59.2

Table 8 California Land Evaluation and Site Assessment Model Scoring Thresholds	
Total Land Evaluation and Site Assessment Score	Scoring Decision
0 to 39 Points	Not Considered Significant
40 to 59 Points	Considered Significant <u>only</u> if Land Evaluation <u>and</u> Site Assessment subscores are each <u>greater</u> than or equal to 20 points
60 to 79 Points	Considered Significant <u>unless</u> either Land Evaluation <u>or</u> Site Assessment subscore is <u>less</u> than 20 points
80 to 100 Points	Considered Significant

**RE: FINAL REPORT OF FINDINGS ECONOMIC/EMPLOYMENT (JOBS)/FISCAL IMPACT ANALYSIS AND STATEMENT OF POTENTIAL FOR URBAN DECAY: CED WESTSIDE CANAL BATTERY STORAGE, LLC: IMPERIAL COUNTY, CA**

Dear Mr. Minnick and Mr. Black:

On behalf of Development Management Group, Inc., I am honored to provide you with our independent analysis of the economic, employment and fiscal impacts of the proposed CED Westside Canal Battery Storage, LLC project in Imperial County, CA. The purpose of this cover letter is to provide you with a brief explanation of each of the three analyses contained in this report and a summary. By review, the proposed project is a 2,000 MW battery storage facility over approximately 163 acres.

An *Economic Impact Analysis* calculates the predicted impact to a community or region as a result of a project or activity. This includes all known direct (and indirect) expenditures as a result of both construction and operation for the projected life of a facility/project. With respect to the CED Westside Canal Battery Storage, LLC project we have calculated that the economic impact to the Imperial County region will be approximately \$165.13 million over the thirty (30) year life of the project (inclusive of both project construction and operations but exclusive of governmental taxes and fees).

An *Employment or Jobs Impact Analysis* calculates the total amount of construction and operational jobs. Specific to the CED Westside Canal Battery Storage, LLC, we have determined that the proposed project will generate the equivalent of 1,549 full-time one-year equivalent construction jobs over the construction period (five-phases in odd years (1-9)) and 20 full-time equivalent permanent jobs, at buildout.

These are all new economic benefits and jobs as the subject site is reported to have not been actively used for agriculture or any other uses for at least fifteen (15) years.

---

Office: (760) 346-8820 ■ Mobile: (760) 272-9136 ■ Fax: (760) 346-8887  
michael@dmgeconomics.com ■ www.dmgeconomics.com

Finally, a *Fiscal Impact Analysis* calculates the amount of revenue a governmental agency is expected to receive and calculates the projected costs they will incur to provide appropriate services to both the project and the additional population/employment generated as a result of such. A comparative model is then produced in order to determine if the project is of economic benefit or cost to the government agency.

Development Management Group, Inc. has calculated that the CED Westside Canal Battery Storage, LLC will generate approximately \$81.53 million in net local (county) tax revenue over the thirty (30) year life of the project. This is derived from an estimated \$34.77 million in sales tax revenue and \$46.77 in net property tax revenue.

It is projected that it will cost the County about \$22.46 million to provide appropriate services to the project and related employment thus generating a projected surplus to the County of Imperial of about \$59.08 over the thirty (30) year period this report represents (subject to acceptance of the recommendations provided within the report).

Note that this amount is based solely on the tax laws that are currently in place and does not include any amounts that may be received by the County under a Public Benefits Agreement or similar arrangement.

A complete report of findings along with a list of sources and detailed calculations are contained within the report that follows. We are prepared to answer any questions you may have about our work and conclusions. I can be reached at (760) 272-9136 or by email at michael@dmgeconomics.com.

Sincerely,

Michael J. Bracken  
Managing Partner

## **1. Introduction**

Development Management Group, Inc. (DMG) has been retained by the County of Imperial to provide an independent Economic Impact Analysis (EIA), Employment/Jobs Impact Analysis (JIA) and Fiscal Impact Analysis (FIA) for a proposed energy battery storage facility to be constructed within the County of Imperial. The project is scheduled to hold a maximum of 2,000 MW of power for a period of one hour. CED Westside Main Battery Storage, LLC is the development company proposing this project. For purposes of this report, the project shall be referred to by its entire name or by ConEd Westside.

This Employment Impact Analysis assumes all calculations in 2020 dollars as a base year with an appropriate adjustment for future years (see notes in exhibits for assumptions). The expected life of the facility is 30 years which is generally in line with the length of entitlements for these types of projects.

## **7. Qualifications of Consultant**

Development Management Group, Incorporated (DMG, Inc.) specializes in services related to microeconomics and economic development. Such services include site selection and analysis, economic development strategic planning and implementation, development management, market/development feasibility, economic analysis, entitlement/permit processing and project financing. DMG has completed over two hundred (200) Fiscal and Economic Impact Analysis projects for both the private and public sector and serves as a contract economist for the Southern California Association of Governments.

For over fifteen (15) years, DMG, Inc. has assisted over five dozen companies with their site selection and entitlement/permit processing. These companies have created thousands of new construction and permanent jobs and invested tens of millions of dollars within the communities they are located. In addition, DMG, Inc. has assisted several public agencies and economic development corporations with economic impact analysis, strategic planning, marketing and other business recruitment projects creating the administrative and operational infrastructure to enable them to grow their economies.

The company founder, Michael Bracken, brings over 25 years of local, regional, and state government experience in the fields of economic development, redevelopment, housing and sales and use tax administration. Before founding Development Management, Inc., Bracken completed four years as the President and Chief Executive Officer of the Coachella Valley Economic Partnership where he led a regional business recruitment team that generated over \$90 million of economic investment for the Palm Springs Region of Southern California.

Bracken holds a Bachelor's Degree in Business Administration and a Master's Degree in Public Administration from The California State University San Bernardino (CSUSB). He co-designed CSUSB's Master's level course titled *Management of Local Economic Development*, which trains economic development professionals in business recruitment and effective use of financial and tax incentives.

He is also a former City Councilman and Vice-Chairman of a Community Redevelopment Agency providing unique and beneficial prospective to local governments.

## **8. Description of Economic Multipliers**

There are two types of multipliers that are generally utilized by economists. These include spending multipliers and job creation multipliers. Simply stated, spending multipliers is the calculation of the number of times a dollar is expected to be spent through the regional economy. Economic multipliers differ based on the origination of that particular dollar. For example, labor multipliers are higher than material multipliers as labor dollars are paid directly to personnel and generally spent more locally. Dollars spent on materials (for example, construction materials) are more likely to leave the regional economy as they are used to pay suppliers located elsewhere.

Economists often provides the example of a gold mining town when describing the concept of economic multipliers. Imagine a gold miner with money paying various persons within the town for a place to sleep, equipment to mine, food and entertainment. The recipients of these dollars then utilize the money they received for their own purchases (including a place to sleep, supplies for their businesses, food and entertainment). Economic multipliers are the basis of understanding how a particular business or use will impact a regional economy.

There is disagreement between individual economists and government authorities regarding appropriate economic multipliers. More aggressive economists often argue for higher economic multipliers stating that dollars continually circulate through an economy. Conservative economists believe that multipliers are lower, and that the circulation has an ending point (and therefore a new beginning point) in the spending cycle. In an effort to provide the greatest amount of accuracy to an analysis of this nature, Development Management Group, Inc. utilizes the RIMS II model (produced by the United States

Bureau of Economic Analysis) , which most economists consider to be a more conservative estimate of economic multipliers.

The RIMS II model is based on work by the United States Bureau of Economic Analysis. DMG, Inc. is utilizing the latest RIMS II Model (dated 2012/2017). Use is also made of the California Economic Strategy Panel 2009. They published a study titled “Using Multipliers to Measure Economic Impacts”. This publication looks at 473 industry types. In this report, earnings have an economic multiplier of between 1.40 (industries related to social assistance) and 7.59 (industries involving water transportation). Most economic multipliers are in the 2.00 to 2.50 range.

Employment multipliers help predict the number of additional jobs that are created elsewhere in the economy for each job of a certain type. For example, if a certain type of job (let’s say one involving the retail trade which has a multiplier of 1.6312, for each job directly attached to retail, an additional .6312 (or 6/10) of a job is created elsewhere in the economy). DMG, Inc. applies the use of economic multipliers in the following pages to help present potential economic, employment and fiscal impacts.

## **9. Need for Renewable Energy Generation**

As the Renewable Portfolio Standard (RPS) requirements continue to increase, so will investment in the region. California has essentially met the RPS standard of a minimum of 33% (SBX1-2) and is now working toward the implementation of SB350 which increases the RPS standard to 50% by 2030. Most recently (September 2018) California Governor Jerry Brown signed SB 100 into law, which sets the bar for California to generate 100% of energy through renewable sources by the year 2045.

Most forms of renewable energy have limitations for when it is produced. For example, wind energy can only be produced at times when the prevailing wind is sufficient for the wind-turbines to turn. Relative to solar energy, production occurs when the sun is active with photovoltaic panels.

For California to achieve RPS 50 and RPS 100, energy storage will need to occur. This will allow energy to be produced when it is most efficient or possible (again wind and solar), stored and brought to market through transmission and distribution when it is needed. The CED Westside Main Battery Storage, LLC project is meant to provide battery storage for energy production. The proposed project will hold as much as 2,000 MW of power for up to sixty (60) minutes.

## 10. Host Region, Location and Project Description

The County of Imperial, California (Imperial County) is located in the southeast corner of California. The population of the County is approximately 188,821. The California Employment Development Department (EDD) shows as of August 2020 that the unemployment rate for Imperial County is 22.9% with 69,200 available in the workforce, 53,400 employed and 15,900 currently unemployed.

CED Westside Canal Battery Storage, LLC is proposing to construct a 2,000 MW (phased) energy battery storage facility in the Imperial Valley portion of Southern California. The project would comprise the development of approximately 163 acres of land in areas that are generally described as portions of unincorporated Imperial County South of Interstate 8, North of Interstate 98, West of Drew Road and immediately South of and adjacent to the Westside Canal (generally about 9 miles West-North-West of the City of Calexico).

*Figure 1: Location Map*

By nature, a battery storage facility provides energy stabilization to residents and businesses. As described previously, wind and solar energy is only generated a limited number of hours per day. Energy demand is ongoing (though does vary by the time of day). A 2,000 MW battery storage facility has the ability to store power needed by up to 650,000 homes (at 325 homes per MW) for a period of sixty (60) minutes. At 3.5 persons per household, which is a general estimate in Southern California, the ConEd Westside Battery project could support a community of 2.3 million people with their energy needs for up to sixty minutes (note that the project developer indicates that the energy storage duration could last from one (1) hour to ten (10) hours). The facility is scheduled to be built over a period of about nine (9) years as demand for battery storage dictates growth. Note that while the project developer is seeking an entitlement to construct a maximum of 2,000 MW that the phasing only schedules out the first 1,500 MW (which is what DMG, Inc. has analyzed). If the entire project is eventually constructed, the economic, job and fiscal impacts will be different than what this analysis contains.

**The subject parcel numbers are provided below:**

051-350-009	051-350-018
051-350-010	051-350-019
051-350-011	

Total Acreage: 163 (approximate)

***Figure 2: Simulated Rendering of ConEd Westside Battery looking NW from Drew Rd. & Lyons***

## **11. Description of Analyses Contained and Limitations**

Development Management Group, Inc. is presenting three types of analysis. These include an Economic Impact Analysis, an Employment or Jobs Impact Analysis and a Fiscal Impact Analysis. Each serves a distinct purpose in evaluating the overall community economics of a project.

An ***Economic Impact Analysis*** is designed to provide calculations regarding the potential overall economic impact of a project for a region. It gives an understanding of the quantity of dollars that will flow through an economy as a result of a project. In the case of an energy battery storage project this includes such items as labor, construction materials, local purchases and operations. Additionally, calculations are presented regarding the amount of money that will be generated for governmental purposes (through taxes and fees). A combination of the two calculations (and associated multipliers) provides a full understanding of the potential economic impact.

An Employment Impact Analysis (or in this case what we term as a ***Jobs Impact Analysis***) provides calculations regarding the number of direct and indirect jobs that are generated as a result of construction and operation of the project. Additionally, it provides a comparison to the direct and indirect jobs that are currently in place if the subject land is in use.

Finally, a ***Fiscal Impact Analysis*** provides a financial picture of what it may cost a governmental authority (such as the County of Imperial) to provide essential goods and services to a community as a result of a specific development project and compares it to the revenue stream that is expected as a result of the same project. The consolidation of the two calculations provides a graphical analysis for which to determine if a project is fiscally viable for a governmental agency.

This report does have certain limitations, which are disclosed below:

1. CED Westside Canal Battery Storage, LLC has stated that their intention is to seek entitlements to build a maximum of 2,000 MW of battery storage. They have scheduled (for phasing/projection purposes) the first 1,500 MW over a nine-year timeframe (the balance would be constructed if there is sufficient market demand):

- a. Year 1: 100 MW
  - b. Year 3: 200 MW
  - c. Year 5: 300 MW
  - d. Year 7: 400 MW
  - e. Year 9: 500 MW
2. The applicant states they are seeking a forty (40) year Conditional Use Permit. DMG, Inc. has completed an Economic/Job/Fiscal Impact Analysis covering the first thirty (30) years of the proposed project's life. Our work is limited to thirty (30) years so that the figures presented are more useful to the County of Imperial in assessing impacts for budgeting purposes. This also recognizes that tax law and allocations are subject to change, based on State Law.
  3. DMG, Inc. does not provide an analysis of a highest and best use of the subject property. Our analysis is limited to analyzing the proposed/projected use.
  4. DMG, Inc. does not provide civil engineering services or construction cost estimation. We rely on information presented to us from the project developer, though we do compare said information to other similar projects we have analyzed (when applicable).
  5. DMG, Inc. endeavors to utilize as much third-party data as possible, but as with any projection, certain assumptions must be made for which to provide appropriate calculations and conclusions.
  6. DMG, Inc. recognizes that some of the data provided directly by the project proponent is considered proprietary in nature. This said, it is not completely possible to protect all such information in relation to completing this analysis without utilizing some of the specific numbers and calculations.
  7. DMG, Inc. has copyrighted each and every page of this report. The purpose of the Copyright is to protect our analysis and report structure as it is considered intellectual property of DMG, Inc. This said, the County of Imperial does have unlimited use of this report (in Final Report status) for analysis of the project and to submit to the County of Imperial and/or other governmental or permitting authorities which may print/publish for public comment and make public policy decisions, so long as it is not reverse engineered for use to analyze other project(s). Any use by any other person or entity of this analysis and/or system without the express written and/or licensed permission of Development Management Group, Inc. is prohibited.

## **12. Economic Impact Analysis (Exhibits A thru F)**

### **Construction and Operation**

CED Westside Canal Battery Storage's battery storage project is anticipated to cost approximately \$1.8 billion (this includes the construction of 1,500 MW of energy storage capacity for a period of sixty (60) minutes. If the entire 2,000 MW were to be constructed (over the same timeframe) the capital expenditures would total in excess of \$2.43 billion. The costs are generally split into short term (construction) and long term (operational) impacts.

The construction phase of the project is scheduled to include the following types of expenditures:

1. Site Acquisition
2. Engineering
3. Project Management (including Overhead and Profit to an EPC)
4. Battery Storage Facility (including the equipment and labor)
5. Site Work (clearing & grubbing, grading and fencing)
6. Project Substation (for which to "collect" the energy and prepare it for transmission)
7. Interconnection Facilities (to take the power and "load" it onto power transmission lines)
8. Interior Roads & Landscaping
9. Operations Facilities

In terms of construction, the project is expected to generate about 1,550 full-time equivalent jobs lasting about one (1) year. In total, about \$194.2 million is projected in on-site labor construction labor costs (this is exclusive of engineering, overhead, management and other professional hours scheduled through the EPC (EPC is an industry term meaning Engineering, Procurement & Construction)). The economic multiplier for construction labor is 1.1331. This means that for each dollar spent on labor to construct the facility it is anticipated that an additional 13.3 cents are spent within the economy as that dollar circulates. In total, it is projected that the economic impact of construction labor will be about \$220.05 million.

Additionally, \$1.61 billion in material purchases are anticipated to construct the energy storage (battery) project and support facilities. DMG, Inc. projects only a small portion of the material purchases will come from within the region. Such material may include aggregate, concrete, fencing, landscaping and similar items that would be available at a more cost-efficient basis locally.

Thus, for purposes of calculating the potential impact of the development of the project, we are estimating that 5% of the overall materials purchased may come from within the region. This would equate to about \$80.3 million dollars being spent within the region on materials during the construction period. In applying an economic multiplier of 1.1517 for construction material purchases, the overall economic impact of material purchases within the region is anticipated to be about \$92.47 million over the same period.

Long term operational impacts will take the form of operational labor, facility security and maintenance. Information from the developer suggests some additional local material purchases to be made as part of the operation of the facility. It is estimated that the local/regional economic impact of material purchases (during the thirty (30) year life) of the facility will have an economic impact of about \$30.6 million on the regional economy.

The project is scheduled to be built over five (5) phases. The first phase (100MW) will result in four (4) full-time operation jobs. Build-out (1,500 MW) will generate about 20 full-time jobs. Overall, the project has about 1 full-time operation job per 75MW of power produced. The projected full-time wages are significantly above median wages in the region. In year one, fully burdened salaries (inclusive of salary and benefits) exceed \$110,000 annually.

Finally, revenue from the sale of land has recirculate into the economy. At an approximate cost of \$1.18 million (DMG, Inc. research estimates), the economic impact of the land sale itself is \$1.33 million (note the land was previously purchased and DMG, Inc. is simply reflecting the economic impact of the transaction to the overall economy).

It is calculated that the construction and operation of CED Westside Canal Battery Storage project will have an overall economic impact to the County of Imperial of about \$165.13 million over a twenty (30) year period inclusive of construction and operation, but not including governmental revenues (taxes and fees).

### **Conclusion Regarding Economic Impact to the County of Imperial**

Development Management Group, Inc. projects that the CED Westside Canal Battery Storage project will have approximately ***\$165.13 million in economic impact to the regional economy*** over a thirty (30) year period not including governmental revenues (taxes and fees).

### **Governmental Revenues**

The CED Westside Canal Battery Storage will provide certain and specific tax revenues to the County of Imperial and other region-based taxing organizations. By way of background, while California Law provides a property tax exemption for qualified solar energy systems, there is no such language exemption that applies to energy battery storage projects. For reference, the solar exemption is found in Section 73 of the California Revenue and Taxation Code.

As stated previously, the proposed project will be built in phases. The build-out is scheduled to occur in Year 9 or Year 10. At that point, (Year 9) the project will generate about \$12.56 million in base level (1%) property taxes. That said, the equipment is believed to be on a depreciation schedule that will reduce its value (and therefore property) taxes on an annual basis. There is little information available regarding what an acceptable depreciation schedule will be as there are no other known battery storage facilities of this type/size in Southern California. DMG, Inc. has completed similar analysis for other battery storage projects and what we have used as a depreciation schedule for property tax purposes is what other project developers have stated they are using. That said, it is likely that this will be an item of discussion and potentially contention between various counties and project developers/owners and in no way is the presented depreciation schedule meant presented by or agreed to by either party. If the project developer and County of Imperial agreed to a specific depreciation schedule that is different from the one presented and used in Exhibit C, DMG, Inc. reserves the right to modify this report.

Depreciation Schedule (Year Refers to when Equipment Placed into Service)\*

Year 1: 95%	Year 6: 45%
Year 2: 85%	Year 7: 35%
Year 3: 75%	Year 8: 25%
Year 4: 65%	Year 9 (and After): 20%
Year 5: 55%	

\*Note the Depreciation Schedule presented and utilized has NOT been reviewed nor approved by the County of Imperial. The actual depreciation is within the purview of the County of Imperial and the State of California.

Overall, it is estimated that the ConEd Westside Battery project will generate some \$169.8 million in base level (1%) property taxes in the thirty (30) years of scheduled operation. Exhibit C provides the estimated tax revenue (inclusive of Sales & Use Tax and Property Tax) to the County of Imperial. Exhibit D is a breakdown of property tax revenues to the County of Imperial while Exhibit E provides a consolidated list of property tax revenue by taxing entities across Imperial County. The County of Imperial itself is expected to receive about \$46.8 million between General Fund (net of ERAF), County Library and County Fire dedicated property taxes. In total, tax benefitting entities across Imperial County will share \$193.75 million of property tax revenues over the first thirty (30) of the project. This is inclusive of various voter-approved taxing initiatives benefitting the Imperial Community College District and Imperial Unified School District.

The second revenue stream comes from Sales Taxes. In the State of California sales tax is applicable when construction materials are purchased by a construction contractor. An example would be a contractor that purchases roofing materials from a roofing supply company. At the time the contractor purchases the materials, he or she pays sales tax on the amount purchased. The point of sale is the place where the purchase was “principally negotiated” which is typically the location of the roofing supply business. The point of sale is important because local jurisdictions receive a portion of the sales tax collected.

In the case of an energy battery storage facility that is scheduled to have \$1.605 billion in materials purchases during the total construction period (Years 1-9), Sales & Use Tax revenue is significant. The point of sale provides substantial financial benefit to the jurisdiction for which the retailer (supplier) of the materials is located. It is noted that the State of California offers an exemption on the State of California portion of Sales & Use Tax applicable to materials used for battery storage. That said, the local share is still applicable.

The following paragraphs provide guidance regarding the applicability of sales tax on construction equipment and the appropriate structure so that the County of Imperial may maximize its ability to receive financial benefit as the designated point of sale:

There are two (2) documents which are worthy of review and understanding relative to how sales and use tax can and should be handled for the project in Imperial County. The first is Regulation 1521, which governs Construction Contractors and defines Construction Contracts. The second is Publication 28 entitled “Tax Information for City and County Officials” (relative to Sales and Use Tax). Both documents are available through the California State Board of Equalization.

Under Regulation 1521, materials utilized for the construction of the facility are subject to Sales & Use Tax. Further, CED Westside Canal Battery Storage or anyone else that would be installing them on real property would be a Construction Contractor and the “retailer” of the product. This means that CED Westside Canal Battery Storage or their Construction Contractor would be responsible for reporting and paying of sales and use tax to the State of California. A section under Regulation 1521 deals directly with Construction Contractors that are also the manufacturer of the product. Simply stated, there are various methods for which CED Westside Canal Battery Storage to determine the retail price or value of the product. Such methods are described in detail on Page 3 of Regulation 1521 (Measure of Tax: Determining Cost Price).

Sales and Use Tax applies to fixtures utilized in the construction process. The law provides the option for a Construction Contractor to obtain a “Sales Tax Jobsite Sub-Permit” that allows the reporting of sales and use taxes at the jobsite itself (rather than where the fixtures were purchased). Essentially this means that the County of Imperial (under the Jobsite Sub-Permit) would receive the maximum financial benefit of a project such as the one proposed by CED Westside Canal Battery Storage. Publication 28

Exhibits A and B provide greater detail as to both the qualification and application to obtain a “Jobsite Sub-Permit”.

Essentially, at such time as construction commences, CED Westside Canal Battery Storage would simply file for a “Sales Tax Jobsite Sub-Permit for Construction Contractors (Exhibit A of Publication 28). Sales Tax will then be reported to the Board of Equalization and paid by CED Westside Canal Battery Storage. Since the Sub-Permit will be specific to the job site, the County of Imperial will receive the maximum amount of sales tax as the local entity.

**Sales and Use Tax Designated for the County of Imperial:**

In total, the County of Imperial would receive a total of 2.33% of the cost or value of tangible personal property sold within the County. This is comprised of the 1% “Bradley-Burns Uniform Local Tax” base amount, .50% Public Health Allocation (from the State), .50% Public Safety Allocation\* and .33% Transportation Tax (the actual tax is .50%, though only .33% of the .50% goes to the County of Imperial specifically, the balance is used regionally and may benefit other municipalities within the region.

\*Note: there is uncertainty as to whether the State of California will provide the .50% for Public Health Allocation under this formula. This figure is within the State allocation that the State has chosen to forego for these types of projects.

In terms of application to the CED Westside Canal Battery Storage, if the County of Imperial were to require as part of the Conditions of Approval (or similar project governing document) that the site location be designated as the “Point of Sale” and the County of Imperial will be the beneficiary of \$34.8 million in sales tax over the construction period (Years 1-9).

It is projected that the County of Imperial will garner approximately \$204.53 million in **gross** revenues (sales and property taxes) over the life of the project (Years 1-30). The accepted multiplier for dollars generated (and spent) by local governments is 1.3918 which mean that the overall economic impact of the tax revenue received by the County of Imperial is approximately \$284.66 million over the twenty (30) year life of the project.

**\*\*Note:** The Imperial Irrigation District (incumbent provider of electricity) will likely receive about \$1,000,000 per year (at build-out) in revenue to transmit energy on the Campo Verde IV Generation Tie-in Line. As this amount is a) subject to negotiation and b) not revenue received by the County of Imperial itself, it is not scheduled in the predictive analysis.

### **13. Projected Employment Impacts (Exhibit G)**

The next model (Exhibit G) contemplates the payroll and labor (employment) impacts of the proposed use of the subject site for energy battery storage. During construction phases, the project will generate 1,549 full-time equivalent (FTE) jobs. This is based on approximately 3.22 million craft hours of work (the FTE is simply dividing the total craft hours by 2,080, the average amount of hours in a year for a full-time worker). Each construction job carries a jobs multiplier of 1.1859, meaning for each full-time equivalent job created for the construction of the facility another 2/10ths of a job is created elsewhere in the economy. Further for each \$1 spent toward construction labor, an additional 13.3 cents are generated elsewhere in the economy (based on a 1.1331 labor multiplier). Overall, this means that the construction of the facility will create a total of 1,837 direct and indirect jobs lasting one year (FTE) and produce about \$258.48 million in total economic impact from construction labor.

At build-out, the facility will have twenty (20) permanent on-site full-time employees engaged in a variety of professional and maintenance level tasks. Additionally, the facility may host outside vendors and equipment manufacturers completing various testing and compliance work. Overall, the operation staff will have wages in 2020 dollars that significantly exceed the median wages in Imperial County with positions starting between \$75,000 and \$100,000 per year (plus benefits) (note that the Median Household Income for Imperial County is estimated at \$45,834 per the American Community Survey (2018)). Utility jobs have one of the highest job multipliers, it is estimated that the one (1) direct job will generate an additional .45 of a job (1/2 a job) will be generated elsewhere in the economy.

**Figure 3**

**Employment Impacts from Proposed CED Westside Canal Battery Storage, LLC Project**

<i>Item</i>	<i>Battery Storage w/o Construction</i>	<i>Battery Storage w/Construction</i>
Construction FTE*	0	1,549
Projected Direct Jobs (at Buildout)*	20	1,569
Projected Total Jobs **	29	1,866
Projected 20-Year Employment Impact	\$98,250,378	\$318,298,398

\*Construction FTE is total one-year equivalent

\*\*Projected total jobs include both direct and indirect jobs based on RIMS II Modeling

**14. Fiscal Impact to the County of Imperial, California (as a Municipal Corporation) Exhibits**

**H-J**

A Fiscal Impact Analysis was completed to determine if the revenues scheduled were sufficient for which to allow the County of Imperial to provide essential goods and services to the project site and the additional population within the City as a result of the construction and/or operation of the energy battery storage facility. It is estimated that the County will receive a net of approximately \$81.53 million in tax revenues over the first thirty (30) years of the project (\$46.77 million in property tax revenue and \$34.77 million in sales tax). This figure is a base figure for which to better understand the aggregate fiscal impacts of the proposed CED Westside Canal Battery Storage project on the County.

There are multiple ways of conducting a Fiscal Impact Analysis. DMG, Inc. has chosen to utilize the following assumptions/methodology:

1. Land in and of itself has little call for service from the County of Imperial.
2. Persons employed (to construct, operate or secure) at the facility do require various general governmental services.
3. For purposes of evaluating the potential demand by persons for services, it is assumed that each full-time equivalent job (construction, operation or security) shall support an average citywide household size of 3.87 persons (meaning the employee and an additional 2.87 persons).

4. There is insufficient data to determine the level of specific police and fire services that may be required to service the site, based on its proposed use. Previous communication with various counties in Southern California by Development Management Group, Inc. (Imperial, Riverside, San Bernardino and Kern) reveal that there is not enough data from those regions for which to predict the level of service a County or City provides in terms of public safety call volume for which to calculate a direct costs. DMG, Inc. therefore utilizes a person-household based cost model.

To generate a Fiscal Impact Analysis, a schedule of costs for County of Imperial General Government Services (General Fund) was generated as Exhibit H. This was extrapolated from County of Imperial budget documents. Exhibit H shows approximately \$433.49 million for General Government expenditures by the County of Imperial in Fiscal Year 2019-2020 (this is budgeted amount and not actual spend and does not account for revenue declines because of Covid-19). This equates to approximately \$2,295.75 per person (based on a population of 188,821).

Revenue for counties come from a variety of tax sources including Sales & Use Tax, Transient Occupancy Taxes (also known as Hotel Taxes), Property Tax and revenues provided by the State and Federal Government. Revenues from State and Federal sources are not considered protected and therefore cities must always be able to potentially fund services to their residents without the benefit of these funds.

Development Management Group, Inc. recognizes that the revenue climate (at the State and Federal level) is ever changing and in order to provide a conservative analysis, it is expected that new projects into the County provide sufficient revenue for which to support 100% of the costs (without expectation of additional reimbursement from State or Federal sources). Also, local government budgets for FY 20-21 are considered constrained due to economic losses associated with Covid-19. Therefore, the FY 19-20 Budget for the County of Imperial is utilized to determine service costs to residents.

Utilizing project level data, we have generated a schedule that calculates the estimated costs to provide General Government services because of the proposed project. For example, in Year 1, it is estimated that there will be 205.04 full-time equivalent construction workers and four (4) full-time operational employees.

Overall, in Year 1 (construction and operations), DMG, Inc. calculates that the CED Westside Canal Battery Storage project will need to support a total population of 808.98. At a cost of \$2,296 per person, it will cost the City about \$1,857,227. In Year 2, where there is only operational staff (of four persons), the total population to be supported is 3.87 at a per capita cost of \$2,352 for a total cost of \$36,408. Over the first thirty (30) years of operation, it is estimated that hosting the CED Westside Canal Battery Storage Project will cost the County of Imperial \$22.46 million.

Exhibit J provides a comparison on a year by year basis of the anticipated revenues to the County of Imperial as a result of the project and compares it to the anticipated expense to provide General Government Services to the employees and their families/dependents. The exhibit accounts for the approximately 2.33% of sales tax that is anticipated to be received along with an allocation of (approximately) 27.55% of the overall property taxes paid being available to provide General Government Services. In total, the County of Imperial will receive \$81.53 million in total tax revenue because of the CED Westside Canal Battery Storage project.

Analysis of Exhibit J also shows that the CED Westside Canal Battery Storage will produce substantially more money in tax revenue than it will cost the County of Imperial to host the project. In fact, over the first thirty (30), the County of Imperial will receive \$59.08 million more in revenue than it will spend to host the facility.

#### **15. Statement Regarding Urban Decay (as a Result of CED Westside Canal Battery Storage Energy Center)**

The State CEQA Guidelines discuss and define the parameters for which the consideration of socioeconomic impacts should be included in an environmental evaluation. State CEQA Guidelines Section 15131 states that “economic or social information may be included in an EIR or may be presented in whatever form the agency desires.” Section 15131(a) of the Guidelines states that “economic or social effects of a project shall not be treated as significant effects on the environment.” An EIR may trace a chain of cause and effect from a proposed decision on a project through anticipated economic or social changes resulting from the project to physical changes caused in turn by the economic or social changes. The intermediate economic or social changes need not be analyzed in any detail greater than necessary to trace the chain of cause and effect. The focus on the analysis shall be on

the physical changes.” State CEQA Guidelines Section 15131(b) also state that “economic or social effects of a project may be used to determine the significance of physical changes caused by the project.” One example that has been used by others has been the physical division of a community if rail lines were installed thereby bisecting the community. It is possible that the impacts upon the community could be measured.

In recent years, California Courts have generally defined the term “urban decay” to mean the physical changes that a projects potential socioeconomic impacts could bring to other parts in a community. The case that brought the concept of urban decay to light is Bakersfield Citizens for Local Control v. City of Bakersfield (204) 124 Cal.App.4<sup>th</sup> 1184 in which the court set aside two EIR’s for proposed Wal-Mart projects that would have been located less than five (5) miles from each other. This appears to be the first time the courts used the words “urban decay” rather than “blight”. In essence, the courts ruled that the two (2) Wal-Mart projects could result in a chain reaction of store-closures and vacancies as a result of new retail growth that may or may not be supported by other changes in market conditions (i.e., the downtowns would become ghost towns because the Wal-Mart(s) moved the retail business away from the urban center).

Based on this case and work that DMG, Inc. (and others) have completed relative to “Urban Decay Analysis”), it appears that the core question to ask (and answer) is the following:

***Would the construction of the CED Westside Canal Battery Storage Project at the proposed site result in substantial and adverse physical changes to surrounding areas (i.e., will the project cause such a shift in the marketplace that other portions of the community become visually blighted “urban decay”)?***

The surrounding area contains a combination of solar energy generation projects and agriculture uses (as well as agriculture infrastructure). The proposed project is in keeping with the users in that corridor and in and of itself will not create a physical change to the physical characteristics of that area. In fact, the proposed project would add significant value to the solar generation in that area as it would create needed storage capacity for energy to be placed onto the grid at peak demand times.

***Would the construction of the CED Westside Canal Battery Storage energy battery storage project at the subject site serve as growth-inducing causing a significant addition of other development or population?***

As the State of California is working to confirm with its own laws to provide at least 50% of energy to businesses and residents from renewable sources (and 100% in the future), the State must either construct or allow others to construct energy storage facilities as the leading generators of renewable energy (solar and wind) are not able to generate twenty-four (24) hours a day.

The development and operation of the subject facility will create energy stability in times of production shortages and outages and provide energy at times of peak demand (such as early evening hours). The facility is meant to provide this product/service to existing users and is based on overall energy product by other sources. Essentially the energy battery storage facility is part and parcel to energy infrastructure to support existing production facilities. Therefore, this facility will not serve as growth inducing.

We have further determined that the development of the CED Westside Canal Battery Storage ***WILL NOT*** cause physical blight (urban decay) or serve as growth-inducing because the facility exists to support current renewable energy facilities to provide power supply stability.

#### **15. Recommendations Regarding Fiscal Impacts and Mitigation(s)**

Development Management Group, Inc. serves as an economist for the County of Imperial. In this capacity, we have been assigned the task of completing a full Economic/Job/Fiscal Impact Analysis as well as general recommendations regarding how the County can best maximize economic benefits and/or minimize fiscal harm to the County of Imperial as a Municipal Corporation and its residents.

- A. Development Management Group, Inc. recommends that the County of Imperial consider entering into a formal agreement that requires the project developer to provide certified (and independently audited) payroll records at the conclusion of the project to insure that craft hour estimates (provided by the developer) are accurate and to the extent that the actual craft hours exceeds the estimated craft hours that the County of Imperial is reimbursed for the cost of services needed to support the

construction of the facility. If this is a mitigation measure that the County determines is viable, DMG, Inc. will assist the County in drafting the specific condition of approval appropriate to address this recommendation.

- B. Development Management Group, Inc. recommends that the County of Imperial requires the applicant to have a qualified civil or traffic engineer calculate a) the average life of regional and surface streets from Interstate 8 and/or State Route 98 to the project site(s) b) the potential accelerated impact of street resurfacing based on the construction traffic (equipment and employees) over the first five (5) years of the project c) cost to resurface said streets d) calculate the proportional share for which CED Westside Canal Battery Storage, LLC should be responsible for as part of a direct mitigation payment to the County of Imperial prior to commencing construction. This recommendation is in the event that project construction will utilize surface streets outside of Interstate 8 and/or State Route 98.
- C. Development Management Group, Inc. recommends that the County of Imperial require CED Westside Canal Battery Storage, LLC to enter into a specific cost reimbursement agreement for direct police and fire protection services whereas for each call made to the project site for such public safety services that the project is responsible for reimbursing the County of Imperial. Such agreement can be created using a “Contract Cities Service Rate” for both police (Sheriff) and fire protection services.
- D. Development Management Group, Inc. recommends that the County of Imperial require CED Westside Canal Battery Storage, LLC to enter into a specific cost reimbursement agreement for direct judicial and prosecutory services whereas if a person(s) are tried in a court of law for potential crimes at the project site, that the project itself is required to reimburse the County for such costs.
- E. Development Management Group, Inc. recommends that the County of Imperial require CED Westside Canal Battery Storage, LLC or any other landowner associated with the project sites (parcels) to enter into an agreement(s) whereas the assessed land values shall increase by 2% per annum and improvements and their depreciation schedule (not exempt under Section 73 of the State of California Revenue and Taxation Code) be set by mutual agreement prior to project approval. Such agreement should contain a provision which prohibits said property owner(s) from appealing

their assessed value for the duration of the project operation (or 30 years) whichever comes first. Agreement shall be in full compliance with Proposition 13 in all other aspects.

- F. Development Management Group, Inc. recommends that the County of Imperial require the project developer through Conditions of Approval, Development Agreement or similar document to designate the project site as the “Point of Sale/Point of Use” in compliance with State Board of Equalization Regulation 1521 and file for a “Sales Tax Jobsite Sub-Permit for Construction Contractors” as outlined in State Board of Equalization Publication 28, Exhibit A.
- G. Development Management Group, Inc. recommends that the County of Imperial enter into some type of agreement with the project proponent that recognizes the taxable material cost estimates contained in Exhibit A of this report and provides a formal guarantee (bond or otherwise) in order to provide greater certainty of these figures.
- H. Development Management Group, Inc. recommends that the County of Imperial condition the project so that if battery storage or ancillary equipment is replaced with new equipment after the original construction period (most likely for purposes of utilizing newer technology) that the project site again designated as the "Point of Sale/Point of Use" as to create an additional local tax funding source for the County of Imperial. This requirement is similar to Item F but extends said condition in such cases as a substantial portion of the equipment is "upgraded", "replaced" or “repowered”.

(the balance of this page intentionally left blank)

## **17. Certification**

I certify that my engagement to prepare this report was not contingent upon developing or reporting predetermined results. The statements of fact contained herein and the substance of this report are based on public records, data provided by the CED Westside Canal Battery Storage, LLC and other sources as described in the reference section of this report. This report reflects my personal, unbiased professional analyses, opinions and conclusions. If any of the underlying assumptions related to this report change after the date of this report (December 4, 2020), then the undersigned reserves the professional privilege to modify the contents and/or conclusions of this report.

<b>Notes:</b>										
On-Site Construction Labor based on Prevailing Wage (inclusive) \$53.46. Estimated at 1,746 FTE (One-Year) Total Construction Labor or 3,632,622 craft hours										
Material Purchases estimated to increase by CPI (1.024467% Per Annum, Adjusted by Facility Size)										
Operational Labor estimated to increase by 2.4467% per annum (30-Year CPI)										
Multipliers based on RIMS II, Type 1 Categories 6, 7 & 48										
Project Size Defined as 2,025 MW of power for 1 hour, though only 1,500 MW is currently scheduled in this analysis (Market will dictate actual project side up to maximum amount)										
Land Purchase based on 148 Acres at \$8,000 Per Acre										
ConEd Indicates Nominal Land Leases that are not part of calculations

## Executive Summary

This report provides the results of the air quality emissions analysis performed for the proposed Westside Canal Battery Storage Project (Project) in Imperial County, California. The Project site consists of approximately 148 acres of agriculturally-zoned land located in the unincorporated Mount Signal area of the County, approximately 8.0 miles southwest of the city of El Centro (Assessor Parcel Numbers [APNs] 051-350-010 and 051-350-011). The Project site is located approximately one-third mile north of the Imperial Valley Substation (IV Substation) and directly south of the intersection of Liebert Road and the Imperial Irrigation District's (IID) Westside Main Canal. The Project site is bounded by the Westside Main Canal to the north, Bureau of Land Management (BLM) lands to the south and west, and vacant private land to the east. The Campo Verde solar generation facility is located north of the Project site, across the Westside Main Canal.

The two Project parcels are proposed for development as a utility-scale energy storage complex. The Project would also utilize portions of two parcels located north of the Westside Main Canal (APN 051-350-019 owned by IID and APN 051-350-018 owned by a private landowner) for site access and as a temporary construction staging area. The Project would also access a small portion of APN 051-350-009 within an IID easement for connection to the existing IID Campo Verde – Imperial Valley 230 kilovolt radial gen-tie line during the construction of a switching station on the Project site.

This analysis evaluates the significance of the Project in accordance with the California Environmental Quality Act (CEQA) and guidance from the Imperial County Air Pollution Control District (APCD). The Project was evaluated to determine if it would (1) conflict with applicable air quality plans, (2) result in cumulative impacts to air quality, (3) impact sensitive receptors, or (4) expose a substantial number of people to objectionable odors. Project emissions were calculated using the California Emissions Estimator Model Version 2016.3.2.

A significant air quality impact would occur if the Project conflicted with the Imperial County APCD's ozone and particulate matter air quality plans. Project air pollutant emissions would be consistent with regional growth projections and the air quality plan emission forecasts, and impacts would be less than significant.

A significant air quality impact would occur if the Project resulted in a cumulatively considerable net increase of any criteria pollutant for which the Project region is in non-attainment. Construction- and operation-related emissions would be less than all applicable significance thresholds provided mitigation measures MM-AIR-1, MM-AIR-2, and MM-AIR-3 are implemented. The Project site is in a non-attainment area for ozone, particulate matter with an aerodynamic diameter of 10 microns or less (PM<sub>10</sub>), and particulate matter with an aerodynamic diameter of 2.5 microns or less (PM<sub>2.5</sub>) emissions. Project ozone precursor, PM<sub>10</sub>, and PM<sub>2.5</sub> emissions would be less than applicable significance thresholds. Thus, the Project would not result in a cumulatively considerable net increase of ozone precursors or particulate matter emissions, and impacts would be less than significant.

A significant air quality impact would occur if the Project exposed sensitive receptors to substantial pollutant concentrations including air toxics. There are no sensitive receptors in the immediate vicinity of the Project site. The closest sensitive receptor is a single-family residence located approximately 4,000 feet northeast of the Project site at the intersection of Wixom Road and Vogel Road. The Project would result in the generation of diesel-exhaust particulate matter (DPM) during construction and mobile-source carbon monoxide (CO) during operation. Due to the limited duration of construction and the distance to the nearest sensitive receptor, DPM generated by Project construction activities is not expected to create conditions where the incremental cancer risk exceeds the Imperial County APCD's ten in one million significance threshold; thus impacts from DPM exposure would be less than significant. Due to the limited traffic generated by the Project, the Project would not substantially contribute to elevated CO concentrations; impacts from mobile-source CO emissions would be less than significant. The components of solar generation facilities, including the proposed storage and transmission components, have been shown to emit insignificant air toxic emissions, and localized air quality impacts from Project operations would be less than significant.

Project construction would result in temporary odors associated with diesel exhaust. Odors generated from construction would be temporary and intermittent, and would largely dissipate at short distances from the source. Solar generation facilities, including the proposed storage and transmission components, are not known to emit odors during operation. Thus, the Project would not create objectionable odors adversely affecting a substantial number of people, and impacts would be less than significant.

The Project would have a less than significant impact on air quality. Mitigation measures MM-AIR-1, MM-AIR-2, and MM-AIR-3 would be required along with the standard Imperial County APCD dust and equipment measures discussed in this analysis is required.

# 1.0 Introduction

## 1.1 Purpose of the Report

This report evaluates the significance of air quality emissions associated with the Westside Canal Battery Storage Project (Project). This report characterizes existing conditions at the Project site and in the region, identifies applicable rules and regulations, and assesses impacts related to air quality associated with construction and operation of the Project.

## 1.2 Project Description

Westside Canal Battery Storage, LLC (Project Proponent), a subsidiary of Con Edison Clean Energy Businesses, is proposing to develop, design, construct, own, operate, and maintain the Westside Canal Battery Storage Project (Project), a utility-scale energy storage complex with a capacity of up to 2,000 megawatts (MW). The Project would store energy generation from the electrical grid, and optimally discharge that energy back into the grid as firm, reliable generation and/or grid services.

The Project would be comprised of lithium-ion battery and/or flow battery energy storage facilities, a behind-the-meter solar energy facility, a new on-site 230 kilovolt (kV) loop-in switching station, a 34.5 kV to 230 kV substation, underground electrical cables, and permanent vehicular access to and from the site over a proposed bridge spanning Imperial Irrigation District's (IID's) Westside Main Canal. The proposed loop-in switching station would connect the Project to the existing IID Campo Verde – Imperial Valley 230 kV radial gen-tie line, which connects to the Imperial Valley Substation (IV Substation) and the California Independent System Operator (CAISO), approximately one-third mile south of the Project site. The Project Proponent has submitted the necessary Interconnection Request Applications to the CAISO and IID.

The Project would complement both the existing operational renewable energy facilities, as well as those planned for future development in Imperial County (County), and would support the broader southern California bulk electric transmission system by serving as a firm, dispatchable resource.

The Project is pursuing the following objectives:

- To receive grid energy during beneficial market and operational periods and store that energy for dispatch when the customer (i.e., a load-serving entity) deems it to be more valuable.
- To be a valuable resource in allowing the customer and system operators to manage the effect of intermittent renewable generation on the grid and create reliable, dispatchable generation upon demand.
- To utilize available land that has not been used for agricultural production for more than 15 years, and enhance the site location by providing for permanent vehicular access.

### 1.2.1 Project Location

The Project would be located in the unincorporated Mount Signal area of the County, approximately 8.0 miles southwest of the city of El Centro and approximately 5.3 miles north of the U.S.-Mexico border. Figure 1 shows the regional location of the Project. The Project site is comprised of two parcels owned by the Project Proponent, Assessor Parcel Number (APN) 051-350-010 and APN 051-350-011, totaling approximately 148 acres. These parcels have limited access corridors for vehicular traffic and are considered less desirable for agricultural production, as reflected by the last 15 years during which no farming activity has occurred.

The Project site is approximately one-third mile north of the IV Substation and directly south of the intersection of Liebert Road and the IID's Westside Main Canal. The Project site is bounded by the Westside Main Canal to the north, Bureau of Land Management (BLM) lands to the south and west, and vacant private land to the east. The Campo Verde solar generation facility is located north of the Project site, across the Westside Main Canal. Figure 2 shows an aerial photograph of the Project site and the above-mentioned nearby facilities.

The two Project parcels are proposed for development as a utility-scale energy storage complex. The Project would also utilize portions of two parcels located north of the Westside Main Canal (APN 051-350-019 owned by IID and APN 051-350-018 owned by a private landowner) for site access and as a temporary construction staging area. The Project would also access a small portion of APN 051-350-009 within an IID easement for connection to the existing IID Campo Verde – Imperial Valley 230 kV radial gen-tie line during the construction of a substation on the Project site. The total proposed Project development footprint, encompassing both temporary and permanent impacts, would be approximately 163 acres.

### 1.2.2 Project Components

Figure 3a shows the conceptual site plan for the Project with a representation of the various energy storage technologies, behind-the-meter ground- and roof-mounted solar, common facilities within the Project site, and permanent vehicular access to the Project site. The actual configuration of the Project would depend on the size of individual phases and the type of battery technology deployed. Specific Project components are described below.

FIGURE 2  
Project Location on  
Aerial Photograph

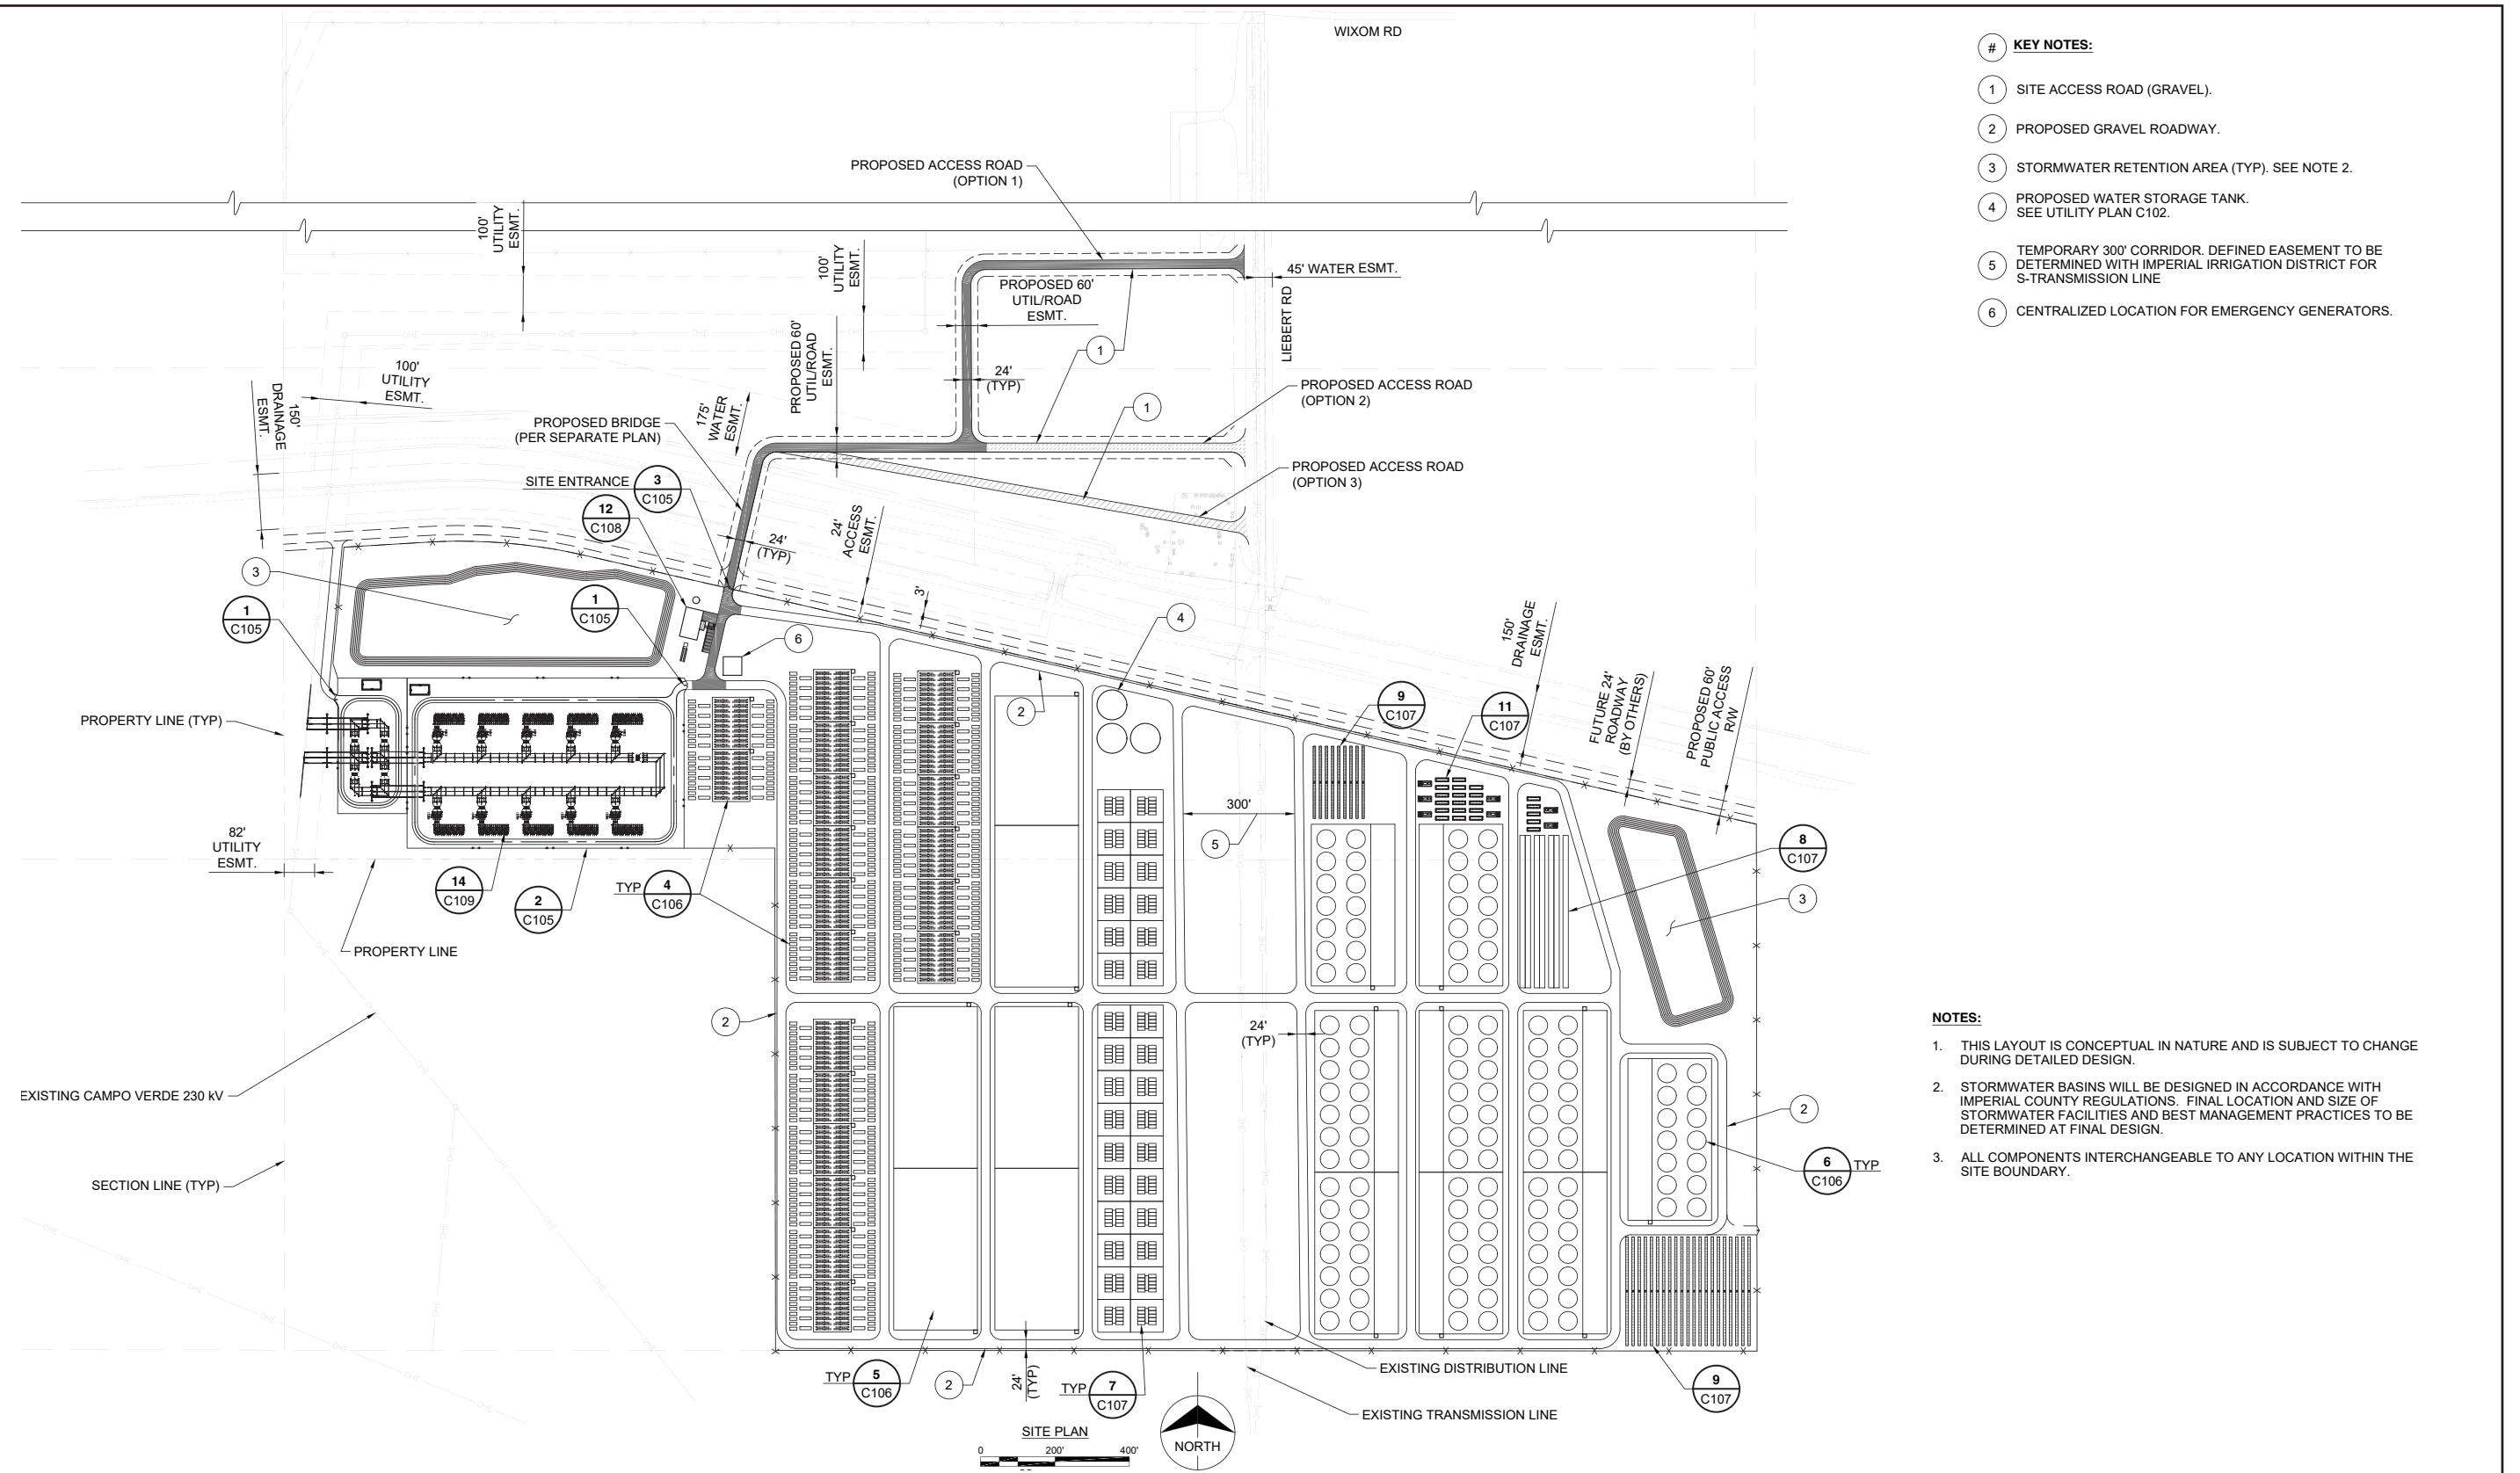

FIGURE 3a  
Site Plan

### 1.2.2.1 Phasing and Schedule

The Project would be constructed in three to five phases over a 10-year period, with each phase ranging from approximately 25 MW up to 400 MW per phase. Depending on the size of the battery system for a given phase, construction and commissioning (approval to operate) is anticipated to take approximately 6 to 12 months. For the purposes of this analysis, the applicant has assumed that construction activities would last for approximately 32 months to complete the full Project build-out.

Construction of the 100- to 200-MW first phase would include roads, a permanent clear-span bridge across the Westside Main Canal, the Operations and Maintenance (O&M) facilities, water connections and water-mains, storm water retention, switching station and Project substation, legal permanent vehicle access, as well as the first energy storage facility. To access the Project site, construction workers would travel along Interstate 8 (I-8) and head 4.6 miles south to the Project site, and would utilize the IID Fern Check Bridge as a temporary pedestrian bridge until the permanent bridge is constructed. During peak construction activities, approximately 200 workers and approximately 30 daily deliveries would be required. It is anticipated that construction of the first phase would begin in 2021.

It is anticipated that each subsequent phase would be constructed within one to two years of each other, with the timing and size of each phase dependent on market conditions and the applicant's ability to secure commercial contracts with prospective customers. With the Project being built in phases, the necessary infrastructure, such as water mains, retention ponds, and access roads, would be built out to serve the Project phases from west to east and expanded over time to serve each phase. These subsequent phases would require improvements such as additional substation equipment, water main and site road extension, but would not require construction of additional common facilities which would be completed during the first phase. The total nameplate (or rated capacity) capacity of the Project at full build-out (all phases completed) would be approximately 2,000 MW.

Construction activities during all Project phases would only occur Monday through Friday, between the hours of 7:00 a.m. and 7:00 p.m. or Saturday between the hours of 9:00 a.m. and 5:00 p.m., excluding holidays, per County Ordinance.

### 1.2.2.2 Common Components

As shown on the site plan (see Figure 3a), the northwest area of the Project serves as the location for the common facilities, which include the switching station and Project substation and the O&M facilities. A summary of the common facilities is presented below:

- 230 kV loop-in switching station
  - Connection to Campo Verde – Imperial Valley 230 kV radial transmission line
  - Located on applicant property
- Project substation
- O&M facilities
- Project parking

- Storm water retention basins
- Fencing and gates
- Interior access roads

Industrial buildings, warehouses, engineered containers, and/or electrolyte storage tanks would be the primary structures needed to house the main Project components. Other components to be located on the Project site and adjacent to the proposed buildings, warehouses, containers, and tanks include the following:

- Inverters, transformers, power distribution panels
- Underground water-main loop for Project operation and fire prevention
- Underground cable to connect to Project substation
- Project site access roads (unpaved/crushed rock)
- Fire water storage tanks
- Above ground water storage tanks
- Heating, Ventilation, and Air Conditioning (HVAC) units
- Ground-mounted or roof-mounted photovoltaic (PV) arrays
- Emergency backup generator(s)

#### **a. O&M Facilities**

The O&M facilities are expected to be the only manned facility on the site. It would include up to approximately 20 full-time employees depending upon the number of phases and type of energy storage facility constructed. O&M employees would work typical weekday hours but may work extended hours, including weekends and 24 hours a day, depending upon the operations and maintenance needs. No offices or staffed control centers would be located within the storage-specific warehouses/buildings. For sanitary waste, the Project would include a septic leach field to be located near the O&M facilities. The proposed O&M facilities would also require an HVAC unit.

#### **b. Permanent Vehicle Access**

There are no circulation element roadways in the immediate vicinity of the Project site. The nearest freeways are I-8, located 4.6 miles north of the Project site, and State Route 98 (SR-98), located 5.2 miles south of the Project site. Drew Road, a two-lane collector, is located 1.3 miles east of the Project site. All other roadways in the immediate vicinity of the Project site are rural roadways. All roadways that would be used to access the Project site from I-8 are currently paved, except for the portion of Liebert Road south of Wixom Road. However, this segment would be paved or graveled prior to Project operation.

The Project is surrounded by private landowners to the east, BLM land to the south and west, and IID maintenance roads and Westside Main Canal to the north. Due to the Project site having no direct vehicular access routes, the applicant is proposing to construct roads on both the north and south sides of the Westside Main Canal on private land, and a new clear-span Imperial County-specified bridge over the Westside Main Canal.

The permanent new clear-span County-specified bridge would span the Westside Main Canal to connect to a proposed access road easement on the north side of the Westside Main Canal. The north side proposed access road would ultimately connect the Project to county road (CR) Liebert Road.

Construction of the permanent clear-span bridge spanning the IID's Westside Main Canal requires the Project Proponent to have access to both the north side and the south of the Canal to perform the necessary construction activities. In addition to being necessary to facilitate construction of the new permanent clear-span bridge, access from the south side of the Canal would allow the Project Proponent to commence construction on the first phase of the Project simultaneously, thereby shortening the duration of construction and potentially minimizing the associated impacts. The Project Proponent is evaluating various options for temporary construction access, including accessing the Project site from the south side of the Westside Main Canal off SR-98, as well as options involving access from the north side of the Westside Main Canal from I-8.

Option 1 would use the existing SDG&E maintenance road off Highway 98, which extends approximately 4.4 miles to the IV Substation. Option 1 would then continue along an existing 1.2-mile-long dirt access road that leads north, then east, outside the western and northern boundaries of the substation. Option 1 then continues northwest along an existing dirt access road that parallels two power lines until the access road connects with the western edge of the Project. The existing dirt road was constructed for the construction and maintenance of the existing Campo Verde – Imperial Valley gen-tie line. Option 2 would use the existing IID Westside Main Canal access road. The selected temporary access option would be used until construction of the permanent bridge is completed. Both temporary construction access routes are presented in Figure 3b.

### **1.2.2.3 Battery Storage Components**

The first phase of site construction would consist of either a lithium-ion battery storage facility or a flow battery storage facility. This first phase would be dependent on the first commercial contract awarded to the applicant by a customer. Large industrial buildings, warehouses, and/or containers to house the storage equipment, including battery cells, modules, racks, and controls for lithium-ion technologies, would be needed. For flow battery technologies, cell stack modules, pumps, and controls may be installed inside industrial buildings or pre-engineered outdoor enclosures. Electrolyte storage tanks and associated piping may be located indoors or outdoors, depending on the technology.

## **a. Battery Modules Technology**

### ***Energy Storage***

Energy storage is the capture of energy produced at one time for use at a later time. A device that stores energy is generally called an accumulator or battery. Energy storage involves converting energy from forms that are difficult to store to more conveniently or economically storable forms. For the purpose of grid connected energy storage, electrical energy will be stored in the form of chemical energy in lithium-ion and/or flow batteries. Energy storage technology may be centralized or may be distributed throughout the plant. Due to requirements for energy storage, the Project components such as the switching station, substation, transformers, and inverters would be energized at all times with the potential to charge or discharge.

### ***Lithium-Ion Battery***

A lithium-ion battery is a type of rechargeable battery in which lithium ions move from the negative electrode through an electrolyte to the positive electrode during discharge, and back when charging. Lithium-ion batteries use an intercalated lithium compound as the material at the positive electrode and typically graphite at the negative electrode. The batteries have a high energy density, no memory effect and low self-discharge.

### ***Flow Battery***

A flow battery is a rechargeable fuel cell in which an electrolyte containing one or more dissolved electroactive elements flows through an electrochemical cell that reversibly converts chemical energy directly to electricity. Additional electrolyte is stored externally, generally in tanks, and is usually pumped through the cell (or cells) of the reactor, although gravity feed systems are also known to be used. Flow batteries can be rapidly "recharged" by replacing the electrolyte liquid while simultaneously recovering the spent material for re-energization. Many flow batteries use carbon felt electrodes due to its low cost and adequate electrical conductivity.

## **b. Backup Generators**

The Project would include emergency backup generator(s) to supply auxiliary power to the facility during rare events in which the entire facility or portions of the facility are disconnected from the electrical grid. The Project would use a hybrid approach to emergency backup power supply. Rather than relying exclusively on backup generators, the hybrid approach involves dedicating a portion of the battery storage system capacity as a source of emergency backup power. The reserved battery storage capacity would be approximately 3 to 4 percent of the size of the constructed battery storage system. This hybrid approach would also rely on the use of on-site, behind-the-meter (BTM) solar power generation to supplement the facility's backup power supply needs. Additionally, propane-fueled generators would augment the backup battery storage capacity and the BTM solar power generation.

The generators would be sized to accommodate control systems and HVAC system loads for equipment protection. Approximately 1.25 MW of backup power generation would be needed for every 100 MW of installed battery storage capacity. Each propane-fueled generator would have a capacity of 150 kilowatts or larger. The purpose of the generators would be to provide system safety for events in which the transmission interconnection and the on-site solar generation system are not available, by supplying the battery HVAC system to maintain battery safety and warranty temperature parameters.

The propane-fueled generators would be installed in a central location near the common facilities or distributed among individual buildings or containers. The generators would be periodically tested (monthly) to maintain backup capability in the event of a grid outage. All generators would be subject to Imperial County (APCD review and permitting requirements).

#### **1.2.2.4 Solar Facility Components**

Photovoltaic solar cells, also called PV cells, convert sunlight directly into electricity. PV gets its name from the process of converting light (photons) to electricity (voltage), which is called the PV effect. The panels are mounted at a fixed angle facing south, or they can be mounted on a tracking device that follows the sun, allowing them to capture the most sunlight. Many solar panels combined together to create one system is called a solar array. On-site, behind-the-meter, PV solar generation would serve as station auxiliary power and be deployed throughout the Project site.

### **1.2.3 Site Security**

A six-foot-tall fence (e.g., chain-link) topped with one-foot-tall barbed wire would be installed around the entire Project site for safety and in order to control access. The switching station and each substation proposed on the site plan would also have fences installed around its perimeter. A camera-equipped call button would be installed at the front entry gate to the site which would be monitored from the Project's O&M facilities. Throughout the site at various points, security cameras may be installed to monitor other areas of the Project site. During the construction of each Project phase, the applicant would have on-site security personnel between dusk and dawn and during hours of non-active construction.

### **1.2.4 Interconnection Options**

The proposed point of interconnection for the Project is the IV Substation 230 kV bus. As reflected in the conceptual site plan, to achieve this, the applicant plans to build a new loop-in switching station on the Project site and connect to the existing IID Campo Verde – Imperial Valley 230 kV radial gen-tie line. This existing gen-tie line ultimately connects to the IV Substation one-third mile south of the Project site. This location would serve as the Project's point of interconnection to the CAISO grid. The applicant has submitted the necessary Interconnection Request Applications to the CAISO and IID.

## 1.2.5 Existing and Proposed Utility Easements

### a. Existing Easements

The Project site (APNs 051-350-10 and 051-350-011) has three major easements lying across the site. The first is for overhead collector transmission circuits and utility facilities, as well as access. This is for the IID Campo Verde – Imperial Valley 230 kV transmission line easement, which lies inside and along the west property line and runs north/south.

The second major easement is a prescriptive easement for an overhead transmission circuit and a utility distribution line that runs north and south and lies directly in the center of the Project site. The IID transmission line within this prescriptive easement is known as the S-Transmission line (S-Line). The third major easement lies along the north property line. This easement was granted to IID for the purposes of the existing Westside Main Canal and appropriate infrastructure and operation and maintenance roads adjacent to the Westside Main Canal.

### b. Proposed Easements

The applicant and IID are in the process of determining the width of this S-Line easement to create a non-exclusive easement. This easement would also include the existing distribution line that lies within the easement. Until this new easement agreement is in place, the applicant has planned for a 300-foot temporary corridor on the Project site plan (centerline of 300-foot corridor is the S-Line) to allow the IID energy engineering team to design and implement an appropriate new easement. Once the width and location of the new easement is determined, all other areas not part of the new S-Line easement lying within the 300-foot corridor will become part of the Project site.

## 1.2.6 Project Operation

Operation of the Project would require routine maintenance and security. It is anticipated that the Project would employ a plant manager and an O&M manager, as well as the addition of a facility manager once the complex deploys approximately 500 MW of generation. The complex will also employ staff technicians, with at least one additional technician for every approximately 250 MW of capacity.

Operation of the Project at full build-out would require up to approximately 20 full-time employees depending upon the number of phases and type of energy storage facility constructed. The Project may require fewer full-time equivalent employees, but 20 was assumed to provide a conservative estimate. O&M employees would work typical weekday hours but may work extended hours, including weekends and 24 hours a day, depending upon the operations and maintenance needs. Assuming two one-way trips per employee, the Project would be anticipated to generate up to 40 trips per day from all maintenance and security personnel.

Figure 3a shows the conceptual site plan for the Project with a representation of lithium-ion buildings and containers as well as flow buildings and containers. The components that make up the energy storage systems and common facilities require various preventative maintenance and at times corrective maintenance. The O&M staff would maintain the Project in accordance with manufacturer and industry best practice maintenance schedules and requirements. Depending on the technology selected for the energy storage component, the substation and transmission lines as well as the behind-the-meter solar inverters and transformers would be energized at all times.

## **1.2.7 Discretionary Actions**

### **1.2.7.1 General Plan Amendment and Rezone**

The Project proposes a General Plan Amendment and Rezone to change the land use designation and zoning for the Project site from Agriculture (A3) to Industrial. The Industrial zoning would be limited to Energy Production/Use.

### **1.2.7.2 Development Agreement**

The applicant may pursue a development agreement with the County of Imperial for this Project.

## **1.3 Criteria Pollutants**

Air quality impacts can result from the emission of pollutants associated with construction and operation of a Project. Construction impacts are short term and may result from fugitive dust, equipment exhaust, and indirect effects associated with construction workers and deliveries. Operational impacts are long term and may result from equipment and processes used in the Project (e.g., water heaters, engines, boilers, and paints or solvents), motor vehicle emissions associated with the Project, regional impacts resulting from growth-inducing development, and local hot-spot effects stemming from sensitive receivers being placed close to highly congested roadways. Health effects can include the following:

- Increased respiratory infections
- Increased discomfort
- Missed days from work and school
- Increased mortality

The analysis of air quality impacts is based on the National and California Ambient Air Quality Standards (NAAQS and CAAQS). NAAQS and CAAQS represent the maximum levels of background pollution considered safe, with an adequate margin of safety, to protect the public health and welfare. Six pollutants of key concern known as “criteria pollutants” include ozone, carbon monoxide (CO), nitrogen dioxide (NO<sub>2</sub>), sulfur dioxide (SO<sub>2</sub>), particulate matter (PM<sub>10</sub> and PM<sub>2.5</sub>), and lead (Pb).

### 1.3.1 Ozone

Ozone is the primary component of smog. Ozone is not directly emitted into the air but is formed through complex chemical reactions between precursor emissions of nitrogen oxides (NO<sub>x</sub>) and reactive organic gases (ROG) (a.k.a. volatile organic compounds [VOC] or reactive organic compounds) in the presence of sunlight. The adverse health effects associated with exposure to ozone pertain primarily to the respiratory system. Scientific evidence indicates that ambient levels of ozone affect not only sensitive receptors, such as asthma sufferers and children, but healthy adults as well. Exposure to ozone has been found to significantly alter lung functions by increasing respiratory rates and pulmonary resistance, decreasing tidal volumes (the amount of air inhaled and exhaled), and impairing respiratory mechanics. Symptomatic responses include throat dryness, chest tightness, headache, and nausea. About half of smog-forming emissions come from automobiles.

### 1.3.2 Carbon Monoxide

Carbon monoxide is a colorless, odorless gas that is formed when carbon in fuel is not burned completely. It is a component of motor vehicle exhaust, which contributes about 56 percent of all CO emissions nationwide. CO enters the bloodstream through the lungs by combining with hemoglobin, which normally supplies oxygen to the cells. However, CO combines with hemoglobin much more readily than oxygen does, resulting in a drastic reduction in the amount of oxygen available to the cells. Adverse health effects associated with exposure to CO concentrations include such symptoms as dizziness, headaches, and fatigue (United States Environmental Protection Agency [U.S. EPA] 2017a).

Small-scale, localized concentrations of CO above the NAAQS and CAAQS may occur at intersections with stagnation points such as those that occur on major highways and heavily traveled and congested roadways. Localized high concentrations of CO are referred to as “CO hotspots” and are a concern at congested intersections, where automobile engines burn fuel less efficiently and their exhaust contains more CO.

### 1.3.3 Nitrogen Dioxide

Nitrogen dioxide is a brownish, highly reactive gas that is present in all urban environments. The major human-made sources of NO<sub>2</sub> are combustion devices, such as boilers, gas turbines, and mobile and stationary reciprocating internal combustion engines. Inhalation is the most common route of exposure to NO<sub>2</sub>. Because NO<sub>2</sub> has relatively low solubility in water, the principal site of toxicity is in the lower respiratory tract. The severity of the adverse health effects depends primarily on the concentration inhaled rather than the duration of exposure. An individual may experience a variety of acute symptoms, including coughing, difficulty with breathing, vomiting, headache, and eye irritation during or shortly after exposure. After a period of approximately 4 to 12 hours, an exposed individual may experience chemical pneumonitis or pulmonary edema with breathing abnormalities, cough, cyanosis, chest pain, and rapid heartbeat.

### **1.3.4 Sulfur Dioxide**

Sulfur dioxide is a combustion product, with the primary source being power plants and heavy industries that use coal or oil as fuel. SO<sub>2</sub> is also a product of diesel engine combustion. The health effects of SO<sub>2</sub> include lung disease and breathing problems for people with asthma. SO<sub>2</sub> in the atmosphere contributes to the formation of acid rain.

### **1.3.5 Particulate Matter**

Health studies have shown a significant association between exposure to particulate matter and premature death in people with heart or lung diseases. Other important effects include aggravation of respiratory and cardiovascular disease, lung disease, decreased lung function, asthma attacks, and certain cardiovascular problems such as heart attacks and irregular heartbeat (U.S. EPA 2017b).

#### **1.3.5.1 Inhalable Coarse Particles (PM<sub>10</sub>)**

PM<sub>10</sub> is particulate matter with an aerodynamic diameter of 10 microns or less. Ten microns is about one-seventh of the diameter of a human hair. Particulate matter is a complex mixture of very tiny solid or liquid particles composed of chemicals, soot, and dust. Under typical conditions (i.e., no wildfires) particles classified under the PM<sub>10</sub> category are mainly emitted directly from activities that disturb the soil including travel on roads and construction, mining, or agricultural operations. Other sources include windblown dust, salts, brake dust, and tire wear.

#### **1.3.5.2 Inhalable Fine Particles (PM<sub>2.5</sub>)**

Airborne, inhalable particles with aerodynamic diameter of 2.5 microns or less have been recognized as an air quality concern requiring regular monitoring. Federal regulations required that PM<sub>2.5</sub> monitoring begin January 1, 1999. Similar to PM<sub>10</sub>, PM<sub>2.5</sub> is also inhaled into the lungs and causes serious health problems.

### **1.3.6 Lead**

Lead is a metal found naturally in the environment as well as in manufactured products. At high levels of exposure, lead can have detrimental effects on the central nervous system. The major sources of lead emissions have historically been mobile and industrial sources. As a result of the phase-out of leaded gasoline, metal processing is currently the primary source of lead emissions.

## 2.0 Regulatory Framework

### 2.1 Federal Regulations

#### 2.1.1 Criteria Pollutants

The NAAQS represent the maximum levels of background pollution considered safe, with an adequate margin of safety, to protect the public health and welfare. The Clean Air Act (CAA) was enacted in 1970 and amended in 1977 and 1990 (42 United States Code [USC] 7401) for the purposes of protecting and enhancing the quality of the nation's air resources to benefit public health, welfare, and productivity. In 1971, in order to achieve the purposes of Section 109 of the CAA (42 USC 7409), the U.S. EPA developed primary and secondary NAAQS.

Six criteria pollutants of primary concern have been designated: ozone, CO, SO<sub>2</sub>, NO<sub>2</sub>, lead, and respirable particulate matter (PM<sub>10</sub> and PM<sub>2.5</sub>). The primary NAAQS "... in the judgment of the Administrator, based on such criteria and allowing an adequate margin of safety, are requisite to protect the public health ..." and the secondary standards "... protect the public welfare from any known or anticipated adverse effects associated with the presence of such air pollutant in the ambient air" (42 USC 7409(b)(2)). The NAAQS are presented in Table 1 (California Air Resources Board [CARB] 2016).

An area within a state is designated as either attainment or non-attainment for a particular pollutant. States are required to adopt enforceable plans, known as a State Implementation Plan (SIP), to achieve and maintain air quality meeting the NAAQS. State plans also must control emissions that drift across state lines and harm air quality in downwind states. Once a non-attainment area has achieved the NAAQS for a particular pollutant, it is redesignated as an attainment area for that pollutant. To be redesignated, the area must meet air quality standards for three consecutive years. After redesignation to attainment, the area is known as a maintenance area and must develop a 10-year plan for continuing to meet and maintain air quality standards, as well as satisfy other requirements of the CAA.

The Project site is located in Imperial County, which is a moderate non-attainment area for the 1997 and 2008 federal ozone standards (U.S. EPA 2017c). The Imperial Valley portion of the county is a serious non-attainment area for the 1987 federal PM<sub>10</sub> standard (U.S. EPA 2017c). The portion of Imperial County that includes El Centro and other cities in Imperial Valley (nonattainment area is defined by townships) is a moderate non-attainment area for the 2012 federal PM<sub>2.5</sub> standards (U.S. EPA 2017c). On May 13, 2017, the U.S. EPA issued a clean data determination declaring that Imperial County had achieved attainment of the 2006 federal PM<sub>2.5</sub> standard (U.S. EPA 2017d).

**Table 1**  
**State and National Ambient Air Quality Standards**

Pollutant	Averaging Time	California Standards <sup>1</sup>		National Standards <sup>2</sup>		
		Concentration <sup>3</sup>	Method <sup>4</sup>	Primary <sup>3,5</sup>	Secondary <sup>3,6</sup>	Method <sup>7</sup>
Ozone <sup>8</sup>	1 Hour	0.09 ppm (180 µg/m <sup>3</sup> )	Ultraviolet Photometry	–	Same as Primary Standard	Ultraviolet Photometry
	8 Hour	0.07 ppm (137 µg/m <sup>3</sup> )		0.070 ppm (137 µg/m <sup>3</sup> )		
Respirable Particulate Matter (PM <sub>10</sub> ) <sup>9</sup>	24 Hour	50 µg/m <sup>3</sup>	Gravimetric or Beta Attenuation	150 µg/m <sup>3</sup>	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	20 µg/m <sup>3</sup>		–		
Fine Particulate Matter (PM <sub>2.5</sub> ) <sup>9</sup>	24 Hour	No Separate State Standard		35 µg/m <sup>3</sup>	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	12 µg/m <sup>3</sup>	Gravimetric or Beta Attenuation	12 µg/m <sup>3</sup>	15 µg/m <sup>3</sup>	
Carbon Monoxide (CO)	1 Hour	20 ppm (23 mg/m <sup>3</sup> )	Non-dispersive Infrared Photometry	35 ppm (40 mg/m <sup>3</sup> )	–	Non-dispersive Infrared Photometry
	8 Hour	9.0 ppm (10 mg/m <sup>3</sup> )		9 ppm (10 mg/m <sup>3</sup> )	–	
	8 Hour (Lake Tahoe)	6 ppm (7 mg/m <sup>3</sup> )		–	–	
Nitrogen Dioxide (NO <sub>2</sub> ) <sup>10</sup>	1 Hour	0.18 ppm (339 µg/m <sup>3</sup> )	Gas Phase Chemi-luminescence	100 ppb (188 µg/m <sup>3</sup> )	–	Gas Phase Chemi-luminescence
	Annual Arithmetic Mean	0.030 ppm (57 µg/m <sup>3</sup> )		0.053 ppm (100 µg/m <sup>3</sup> )	Same as Primary Standard	
Sulfur Dioxide (SO <sub>2</sub> ) <sup>11</sup>	1 Hour	0.25 ppm (655 µg/m <sup>3</sup> )	Ultraviolet Fluorescence	75 ppb (196 µg/m <sup>3</sup> )	–	Ultraviolet Fluorescence; Spectrophotometry (Pararosaniline Method)
	3 Hour	–		–	0.5 ppm (1,300 µg/m <sup>3</sup> )	
	24 Hour	0.04 ppm (105 µg/m <sup>3</sup> )		0.14 ppm (for certain areas) <sup>10</sup>	–	
	Annual Arithmetic Mean	–		0.030 ppm (for certain areas) <sup>10</sup>	–	
Lead <sup>12,13</sup>	30 Day Average	1.5 µg/m <sup>3</sup>	Atomic Absorption	–	–	High Volume Sampler and Atomic Absorption
	Calendar Quarter	–		1.5 µg/m <sup>3</sup> (for certain areas) <sup>12</sup>	Same as Primary Standard	
	Rolling 3-Month Average	–		0.15 µg/m <sup>3</sup>		
Visibility Reducing Particles <sup>14</sup>	8 Hour	See footnote 13	Beta Attenuation and Transmittance through Filter Tape	No National Standards		
Sulfates	24 Hour	25 µg/m <sup>3</sup>	Ion Chromatography			
Hydrogen Sulfide	1 Hour	0.03 ppm (42 µg/m <sup>3</sup> )	Ultraviolet Fluorescence			
Vinyl Chloride <sup>12</sup>	24 Hour	0.01 ppm (26 µg/m <sup>3</sup> )	Gas Chromatography			
See footnotes on next page.						

See footnotes on next page.

**Table 1**  
**State and National Ambient Air Quality Standards**

ppm = parts per million; ppb = parts per billion;  $\mu\text{g}/\text{m}^3$  = micrograms per cubic meter; – = not applicable.

- <sup>1</sup> California standards for ozone, carbon monoxide (except 8-hour Lake Tahoe), sulfur dioxide (1 and 24 hour), nitrogen dioxide, particulate matter ( $\text{PM}_{10}$ ,  $\text{PM}_{2.5}$ , and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.
- <sup>2</sup> National standards (other than ozone, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over three years, is equal to or less than the standard. For  $\text{PM}_{10}$ , the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above  $150 \mu\text{g}/\text{m}^3$  is equal to or less than one. For  $\text{PM}_{2.5}$ , the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard. Contact the U.S. EPA for further clarification and current national policies.
- <sup>3</sup> Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of  $25^\circ\text{C}$  and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of  $25^\circ\text{C}$  and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.
- <sup>4</sup> Any equivalent measurement method which can be shown to the satisfaction of the Air Resources Board to give equivalent results at or near the level of the air quality standard may be used.
- <sup>5</sup> National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.
- <sup>6</sup> National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.
- <sup>7</sup> Reference method as described by the U.S. EPA. An “equivalent method” of measurement may be used but must have a “consistent relationship to the reference method” and must be approved by the U.S. EPA.
- <sup>8</sup> On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.
- <sup>9</sup> On December 14, 2012, the national annual  $\text{PM}_{2.5}$  primary standard was lowered from  $15 \mu\text{g}/\text{m}^3$  to  $12.0 \mu\text{g}/\text{m}^3$ . The existing national 24-hour  $\text{PM}_{2.5}$  standards (primary and secondary) were retained at  $35 \mu\text{g}/\text{m}^3$ , as was the annual secondary standards of  $15 \mu\text{g}/\text{m}^3$ . The existing 24-hour  $\text{PM}_{10}$  standards (primary and secondary) of  $150 \mu\text{g}/\text{m}^3$  also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.
- <sup>10</sup> To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. Note that the national standards are in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the national standards to the California standards the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.
- <sup>11</sup> On June 2, 2010, a new 1-hour  $\text{SO}_2$  standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971  $\text{SO}_2$  national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.  
Note that the 1-hour national standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the 1-hour national standard to the California standard the units can be converted to ppm. In this case, the national standard of 75 ppb is identical to 0.075 ppm.
- <sup>12</sup> The ARB has identified lead and vinyl chloride as ‘toxic air contaminants’ with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.
- <sup>13</sup> The national standard for lead was revised on October 15, 2008 to a rolling 3-month average. The 1978 lead standard ( $1.5 \mu\text{g}/\text{m}^3$  as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.
- <sup>14</sup> In 1989, the ARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are “extinction of 0.23 per kilometer” and “extinction of 0.07 per kilometer” for the statewide and Lake Tahoe Air Basin standards, respectively.

## 2.1.2 Nonroad Diesel Engine Standards

The U.S. EPA developed Nonroad Diesel Engine Standards in 1994. The standards apply to all engines rated over 50 horsepower in nearly all nonroad diesel equipment. Some of the most commonly regulated types of equipment include construction and farming equipment. The primary effect of the Nonroad Diesel Engine Standards has been to reduce NO<sub>x</sub> and PM<sub>10</sub> emissions from equipment subject to the standards.

The Nonroad Diesel Engine Standards have been phased-in in tiers. Tier 1 standards applied to engines sold between 1996 and 2000, Tier 2 standards applied to engines sold between 2001 and 2006, and Tier 3 standards applied to engines sold between 2006 and 2008. Additional Tier 4 standards were authorized in 2004, and were phased in for engines sold between 2008 and 2015.

While all new equipment must meet Tier 4 standards, existing equipment may continue to circulate. The U.S. EPA maintains replacement schedules for various sizes of equipment fleets that require retrofits or replacements over time to gradually bring the existing equipment up to standard.

## 2.2 State Regulations

### 2.2.1 Criteria Pollutants

The California Clean Air Act was enacted in 1988 (California Health & Safety Code Section 39000 et seq.). Under the California Clean Air Act, CARB has developed the CAAQS and generally has set more stringent limits on the criteria pollutants than the NAAQS (see Table 1). In addition to the federal criteria pollutants, the CAAQS also specify standards for visibility-reducing particles, sulfates, hydrogen sulfide, and vinyl chloride (see Table 1).

The state of California is divided geographically into 15 air basins for managing the air resources of the state on a regional basis. Areas within each air basin are considered to share the same air masses and, therefore, are expected to have similar ambient air quality. Similar to the CAA, the state classifies these specific geographic areas as either “attainment” or “nonattainment” areas for each pollutant based on the comparison of measured data with the CAAQS.

The Project site is located in the Salton Sea Air Basin, which encompasses Imperial County and parts of Riverside County (Coachella Valley). The Salton Sea Air Basin is a non-attainment area for the CAAQS for ozone and PM<sub>10</sub> (CARB 2017).

### 2.2.2 Toxic Air Contaminants

The public’s exposure to toxic air contaminants (TACs) is a significant public health issue in California. Diesel-exhaust particulate matter (DPM) emissions have been established as TACs. In 1983, the California Legislature enacted a program to identify the health effects of TACs and to reduce exposure to these contaminants to protect the public health (Assembly

Bill [AB] 1807: California Health and Safety Code Sections 39650–39674). The California Legislature established a two-step process to address the potential health effects from TACs. The first step is the risk assessment (or identification) phase. The second step is the risk management (or control) phase of the process.

The California Air Toxics Program establishes the process for the identification and control of TACs and includes provisions to make the public aware of significant toxic exposures and for reducing risk. Additionally, the Air Toxics "Hot Spots" Information and Assessment Act (AB 2588, 1987, Connelly Bill) was enacted in 1987 and requires stationary sources to report the types and quantities of certain substances routinely released into the air. The goals of the Air Toxics "Hot Spots" Act are to collect emission data, to identify facilities having localized impacts, to ascertain health risks, to notify nearby residents of significant risks, and to reduce those significant risks to acceptable levels.

The Children's Environmental Health Protection Act, California Senate Bill (SB) 25 (Chapter 731, Escutia, Statutes of 1999), focuses on children's exposure to air pollutants. SB 25 requires CARB to review its air quality standards from a children's health perspective, evaluate the statewide air monitoring network, and develop any additional air toxic control measures needed to protect children's health. Locally, toxic air pollutants are regulated through the Imperial County Air Pollution Control District's (APCD) Regulation X. Of particular concern statewide are DPM emissions. DPM was established as a TAC in 1998, and is estimated to represent a majority of the cancer risk from TACs statewide (based on the statewide average). Diesel exhaust is a complex mixture of gases, vapors, and fine particles. This complexity makes the evaluation of health effects of diesel exhaust a complex scientific issue. Some of the chemicals in diesel exhaust, such as benzene and formaldehyde, have been previously identified as TACs by CARB and are listed as carcinogens either under the state's Proposition 65 or under the federal Hazardous Air Pollutants program.

Following the identification of DPM as a TAC in 1998, CARB has worked on developing strategies and regulations aimed at reducing the risk from DPM. The overall strategy for achieving these reductions is found in CARB's Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles (CARB 2000). A stated goal of the plan is to reduce the statewide cancer risk arising from exposure to DPM by 85 percent by 2020.

In April 2005, CARB published the *Air Quality and Land Use Handbook: A Community Health Perspective* (CARB 2005). The CARB Air Quality Handbook makes recommendations directed at protecting sensitive land uses from air pollutant emissions while balancing a myriad of other land use issues (e.g., housing, transportation needs, economics, etc.). It notes that the CARB Air Quality Handbook is not regulatory or binding on local agencies and recognizes that application takes a qualitative approach. As reflected in the CARB Air Quality Handbook, there is currently no adopted standard for the significance of health effects from mobile sources. Therefore, CARB has provided guidelines for the siting of land uses near heavily traveled roadways. Of pertinence to this analysis, CARB guidelines indicate that siting new sensitive land uses within 1,000 feet of distribution centers with heavy truck traffic should be avoided when possible.

As an ongoing process, CARB will continue to establish new programs and regulations for the control of diesel particulate and other air-toxics emissions as appropriate. The continued development and implementation of these programs and policies will continue to reduce the public's exposure to DPM.

### 2.2.3 State Implementation Plan

The California SIP is a collection of documents that set forth the state's strategies for achieving the NAAQS. The California SIP is a compilation of new and previously submitted plans, programs (such as air quality management plans, monitoring, modeling, permitting, etc.), district rules, state regulations, and federal controls. CARB is the lead agency for all purposes related to the California SIP under federal law. Local air districts and other agencies, such as the Department of Pesticide Regulation and the Bureau of Automotive Repair, prepare SIP elements and submit them to CARB for review and approval. CARB then forwards revisions to the U.S. EPA for approval and publication in the *Federal Register*. All of the items included in the California SIP are listed in the Code of Federal Regulations (CFR) at 40 CFR 52.220.

The Imperial County APCD is responsible for preparing and implementing the portion of the California SIP applicable to the portion of the Salton Sea Air Basin that is in Imperial County. These portions include:

- Imperial County 2009 State Implementation Plan for Particulate matter Less than 10 Microns in Aerodynamic Diameter
- Imperial County 2013 State Implementation Plan for the 2006 24-Hour PM<sub>2.5</sub> Moderate Non-attainment Area
- Imperial County 2017 State Implementation Plan for the 2008 8-Hour Ozone Standard

### 2.2.4 California In-Use Off-Road Diesel-Fueled Fleets Regulation

The California In-Use Off-Road Diesel-Fueled Fleets Regulations were approved by CARB in July 2007, and subsequent major amendments were incorporated in December 2011. The regulations are intended to reduce diesel-exhaust and NO<sub>x</sub> emissions from in-use off-road heavy-duty diesel vehicles in California. The regulation requires that any operator of diesel-powered off-road vehicles with 25-horsepower or greater engines meet specific fleet average targets. CARB maintains schedules for small, medium, and large equipment fleets that require equipment retrofits or replacements over time to gradually bring the existing equipment up to standard. As of January 2018, all newly purchased equipment for medium and large equipment fleets will be required to meet Tier 3 or higher engine standards.

## 2.3 Local Regulations

### 2.3.1 CEQA Air Quality Handbook

The Imperial County APCD adopted its *CEQA Air Quality Handbook: Guidelines for the Implementation of the California Environmental Quality Act of 1970* in 2007 and amended the handbook in December 2017 (Imperial County APCD 2017a). The Imperial County APCD CEQA Air Quality Handbook provides guidance on how to determine the significance of impacts, including air pollutant emissions, related to the development of residential, commercial, and industrial projects. Where impacts are determined to be significant, the Imperial County APCD CEQA Air Quality Handbook provides guidance to mitigate adverse impacts to air quality from development projects.

### 2.3.2 Stationary Source Permitting

Pursuant to Imperial County APCD Rule 207 (New & Modified Stationary Source Review) and associated rules such as Rule 201 (Permits Required) and Rule 208 (Permit to Operate), the construction, installation, modification, replacement, and operation of any equipment which may emit air contaminants requires Imperial County APCD permits. The Imperial County APCD requires that all such equipment be assessed for the potential to result in health risk impacts, and permits to operate equipment must be renewed each year equipment is in use or upon the modification of equipment.

### 2.3.3 Fugitive Dust Control

The Imperial County APCD Regulation VIII regulates emissions of fugitive dust. Fugitive dust is:

Particulate Matter entrained in the ambient air which is caused from man-made and natural activities such as, but not limited to, movement of soil, vehicles, equipment, blasting, and wind. This excludes Particulate Matter emitted directly in the exhaust of motor vehicles or other fuel combustion devices, from portable brazing, soldering, or welding equipment, pile drivers, and stack emissions from stationary sources (Imperial County APCD, Rule 800 (c)(18)).

Regulation VIII includes the following specific rules:

- Rule 800–Fugitive Dust Requirements for Control of PM<sub>2.5</sub>
- Rule 801–Construction and Earthmoving Activities
- Rule 802–Bulk Materials
- Rule 803–Carry Out and Track Out
- Rule 804–Open Areas
- Rule 805–Paved and Unpaved Roads
- Rule 806–Conservation Management Practices

## 3.0 Environmental Setting

### 3.1 Land Use Environment

The Project site was previously graded and used as farmland and has been fallow for more than 15 years. The General Plan land use designation and zoning for the Project site and all surrounding parcels to the north and east is Agriculture (A3). The General Plan land use designation for parcels to the south and west are designated open space/recreation areas; zoning does not apply to these BLM lands. The Campo Verde solar generation facility is located north of the Project site and agricultural uses are located northeast of the Project site. Parcels farther north of the Project site also include a mix of agricultural uses and solar generation facilities. The parcel immediately east of the Project site is undeveloped. BLM land south and west of the Project site is generally undeveloped, relatively flat, and barren. The Imperial Valley Substation is located approximately one-third mile south of the southern property line of the site.

### 3.2 Regional Setting and Climate

Climate conditions at the Project site, like the rest of Imperial County, are governed by the large-scale sinking and warming of air in the semi-permanent tropical high-pressure center of the Pacific Ocean. The high-pressure ridge blocks out most storms except in winter when it is weakest and farthest south. The coastal mountains prevent the intrusion of any cool, damp air found in California coastal environs. Because of the barrier and weakened storms, Imperial County experiences clear skies, extremely hot summers, mild winters, and little rainfall (Imperial County APCD 2017b).

Winters are mild and dry with daily average temperatures ranging between 65 and 75 degrees Fahrenheit (°F). Summers are extremely hot with daily average temperatures ranging between 104 and 115°F. The flat terrain and the strong temperature differentials created by intense solar heating result in moderate winds and deep thermal convection. The combination of subsiding air, protective mountains, and distance from the ocean all combine to severely limit precipitation (Imperial County APCD 2017b).

The large daily oscillation of temperature produces a corresponding large variation in the relative humidity. Nocturnal humidity rises to 50 to 60 percent, but drops to about 10 percent during the day. Prevailing winds are from the west-northwest through southwest; a secondary flow maximum from the southeast is also evident. The prevailing winds from the west and northwest occur seasonally from fall through spring and are known to be from the Los Angeles area. Occasionally, Imperial County experiences periods of extremely high wind speeds. Wind speeds can exceed 31 miles per hour and this occurs most frequently during the months of April and May. However, speeds of less than 6.8 miles per hour account for more than one-half of the observed wind measurements (Imperial County APCD 2017b).

### 3.3 Existing Air Quality

Air quality at a particular location is a function of the kinds, amounts, and dispersal rates of pollutants being emitted into the air locally and regionally. The major factors affecting pollutant dispersion are wind speed and direction, the vertical dispersion of pollutants (which is affected by temperature inversions), and topography.

Imperial County experiences surface inversions almost every day of the year. Due to strong surface heating, these inversions are usually broken and allow pollutants to be more easily dispersed. In some circumstances, the presence of the Pacific high-pressure cell can cause the air to warm to a temperature higher than the air below. This highly stable atmospheric condition, termed a subsidence inversion, can act as a nearly impenetrable lid to the vertical mixing of pollutants. The strength of these inversions makes them difficult to disrupt. Consequently, they can persist for one or more days, causing air stagnation and the build-up of pollutants. Highest and worst-case ozone levels are often associated with the presence of subsidence inversions (Imperial County APCD 2017b).

Air quality is commonly expressed as the number of days in which air pollution levels exceed state standards set by CARB or federal standards set by the U.S. EPA. The Imperial County APCD maintains five air quality monitoring stations located throughout the region. Air pollutant concentrations and meteorological information are continuously recorded at these stations. Measurements are then used by scientists to help forecast daily air pollution levels, and to gauge compliance with state and federal air quality standards.

The nearest active monitoring station is the El Centro Monitoring Station located approximately 9.6 miles northeast of the Project site. The El Centro Monitoring Station measures ozone, NO<sub>2</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub>. Table 2 provides a summary of measurements collected at the El Centro Monitoring Station for the years 2016 through 2018.

<b>Table 2</b>				
<b>Summary of Air Quality Measurements - El Centro Monitoring Station</b>				
Pollutant/Standard	2016	2017	2018	
<b>Ozone</b>				
Days State 1-hour Standard Exceeded (0.09 ppm)	4	4	2	
Days State 8-hour Standard Exceeded (0.07 ppm)	11	17	14	
Days Federal 8-hour Standard Exceeded (0.07 ppm)	11	17	14

Federal Annual Average (µg/m <sup>3</sup> )	9.4	8.4	8.6	
SOURCE: California Air Resources Board (CARB) 2020.				
ppm = parts per million; µg/m <sup>3</sup> = micrograms per cubic meter				
* Calculated days value. Calculated days are the estimated number of days that a measurement would have been greater than the level of the standard had measurements been collected every day. The number of days above the standard is not necessarily the number of violations of the standard for the year.				

## 4.0 Thresholds of Significance

The California Natural Resources Agency maintains State CEQA Guidelines to assist lead agencies in developing significance thresholds for assessing potentially significant environmental impacts. According to the CEQA Guidelines Appendix G Environmental Checklist, implementation of the Project would have significant environmental impacts on air quality if it would:

- 1) Obstruct or conflict with the implementation of the applicable air quality plan.
- 2) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard.
- 3) Expose sensitive receptors to substantial pollutant concentration including air toxics such as diesel particulates.

- 4) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

As stated in the State CEQA Guidelines, these questions are “intended to encourage thoughtful assessment of impacts and do not necessarily represent thresholds of significance” (Title 14, Division 6, Chapter 3 Guidelines for Implementation of the CEQA, Appendix G, Environmental Checklist Form). The State CEQA Guidelines encourage lead agencies to adopt regionally specific thresholds of significance. When adopting these thresholds, the amended Guidelines allow lead agencies to consider thresholds of significance adopted or recommended by other public agencies, or recommended by experts, provided that the thresholds are supported by substantial evidence.

The Imperial County APCD CEQA Air Quality Handbook establishes the following four separate evaluation categories (Imperial County APCD 2017a):

- 1) Comparison of calculated project emissions to Imperial County APCD emission thresholds.
- 2) Consistency with the most recent Clean Air Plan for Imperial County.
- 3) Comparison of predicted ambient pollutant concentrations resulting from the project to state and federal health standards, when applicable.
- 4) The evaluation of special conditions which apply to certain projects.

Any development with a potential to emit criteria pollutants below significance levels defined by the Imperial County APCD is called a “Tier I project,” and is considered by the Imperial County APCD to have less than significant potential adverse impacts on local air quality. For Tier I projects, the project proponent should implement a set of feasible “standard” mitigation measures (enumerated by the Imperial County APCD) to reduce the air quality impact to an insignificant level. A “Tier II project” is one whose emissions exceed any of the thresholds. Its impact is significant and the project proponent should select and implement all feasible “discretionary” mitigation measures (also enumerated by the Imperial County APCD) in addition to the standard measures.

## 4.1 Operational Impacts

Table 3 provides general guidelines for determining the significance of impacts based on the total emissions that are expected from project operation established by the Imperial County APCD.

Table 3 Significance Thresholds for Operations		
Pollutant	Tier I	Tier II
NO <sub>x</sub> and ROG	Less than 137 lbs/day	137 lbs/day and greater
PM <sub>10</sub> and SO <sub>x</sub>	Less than 150 lbs/day	150 lbs/day and greater
CO and PM <sub>2.5</sub>	Less than 550 lbs/day	550 lbs/day and greater
ROG = reactive organic gas; NO <sub>x</sub> = oxides of nitrogen; CO = carbon monoxide; PM <sub>10</sub> = particulate matter with an aerodynamic diameter 10 microns or less; lbs/day = pounds per day SOURCE: Imperial County APCD 2017a.		

As stated above, Tier 1 projects are required to implement all feasible standard measures specified by the Imperial County APCD. Tier II projects are required to implement all feasible standard measures as well as all feasible discretionary measures specified by the Imperial County APCD.

## 4.2 Construction Impacts

The Imperial County APCD has also established thresholds of significance for project construction. Table 4 provides general guidelines for determining significance of impacts based on the total emissions that are expected from project construction.

<b>Table 4</b>	
<b>Significance Thresholds for Construction</b>	
<b>Pollutant</b>	<b>Thresholds (pounds/day)</b>
PM <sub>10</sub>	150
ROG	75
NO <sub>x</sub>	100
CO	550
ROG = reactive organic gas; NO <sub>x</sub> = oxides of nitrogen; CO = carbon monoxide; PM <sub>10</sub> = particulate matter with an aerodynamic diameter 10 microns or less. SOURCE: Imperial County APCD 2017a.	

Regardless of project size, all feasible standard measures specified by the Imperial County APCD for construction equipment and fugitive PM<sub>10</sub> control for construction activities should be implemented at construction sites. Control measures for fugitive PM<sub>10</sub> construction emissions in Imperial County are found in Imperial County APCD Regulation VIII and in the Imperial County APCD CEQA Air Quality Handbook and are discussed below.

## 4.3 Public Nuisance Law (Odors)

State of California Health and Safety Code Sections 41700 and 41705 and Imperial County APCD Rule 407 prohibit emissions from any source whatsoever in quantities of air contaminants or other material that cause injury, detriment, nuisance, or annoyance to the public health or damage to property.

The Imperial County APCD CEQA Air Quality Handbook provides screening level distances for potential odor sources. If a project is proposed within one mile of a wastewater treatment plant, sanitary landfill, composting station, feedlot, asphalt plant, painting and coating operation, or rendering plant, a potential odor problem may result (Imperial County APCD 2017a).

## 5.0 Air Quality Assessment

Implementation of the Project would result in air pollutant emissions associated with the construction and operation. Emissions were calculated using California Emissions Estimator Model (CalEEMod) Version 2016.3.2 (California Air Pollution Control Officers Association [CAPCOA] 2017). The CalEEMod program is a tool used to estimate emissions resulting from land development projects in the state of California. CalEEMod was developed with the participation of several state air districts including the South Coast Air Quality Management District (SCAQMD).

CalEEMod estimates parameters such as the type and amount of construction equipment required, trip generation, and utility consumption based on the size and type of each specific land use using data collected from surveys performed in SCAQMD. Where available, parameters were modified to reflect project-specific data.

### 5.1 Construction-related Emissions

Construction-related activities are temporary, short-term sources of air pollutant emissions. Sources of construction-related emissions include:

- Fugitive dust from grading activities;
- Exhaust emissions from construction equipment;
- Application of chemical coatings (paints, stains, sealants, etc.); and
- Exhaust and fugitive dust emission from on-road vehicles (trips by workers, delivery trucks, and material-hauling trucks).

The Project would be constructed in three to five phases over a 10-year period. For the purposes of this CEQA analysis, it was assumed that construction activities would last for a total of approximately 32 months to complete the full Project build-out. Construction of the access road from the north of the Project site, the bridge over the IID canal, and common facilities (including site grading and infrastructure, O&M building construction and substation construction) on the Project site south of the IID canal would occur simultaneously in order to reduce the overall construction schedule. This first phase of construction as well as construction of the first battery storage phase is anticipated to last for 12 months. Total construction of the subsequent battery storage phases is anticipated to last for 20 months. Construction emissions were calculated assuming construction activities would begin in 2021 and last for 32 consecutive months. This is conservative because if sequential construction activities were to occur at a later date, emissions would be less since construction equipment gets cleaner over time due to statewide rules and regulations.

In order to begin construction on the Project site prior to completion of the bridge, construction equipment would be hauled to the Project site. The Project Proponent is evaluating various options for temporary construction access, including accessing the Project site from the south side of the Westside Main Canal off SR-98, as well as options involving access from the north side of the Westside Main Canal from I-8. Under access Option 1, all construction equipment and material deliveries would access the site from the south along

the 5.6-mile unpaved road until completion of the access road and bridge north of the Project site. The first 4.4 miles of the access road is an existing unpaved service road consisting of well compacted dirt and crushed rock, and the last 1.2 miles is an unpaved dirt road that would be covered with construction mats. To access the Project site, construction workers would travel along I-8 and head 4.6 miles south to the Project site, and would utilize the IID Fern Check Bridge as a pedestrian bridge until the permanent bridge is constructed. A majority of this worker access route is paved, and the last approximately 0.3 mile is an unpaved dirt road. Under access Option 2, all material deliveries would access the site using the IID Westside Main Canal access road. As the Option 1 distance is longer than Option 2, emissions were calculated using access Option 1. During peak construction activities, approximately 200 workers and 30 daily deliveries would be required.

### 5.1.1 Mobilization Fugitive Dust

Mobilization fugitive dust calculations were modeled based on utilization Option 1. As discussed in Section 5.1 above, the first 4.4 miles of the access road is an existing unpaved service road consisting of well compacted dirt and crushed rock, and 1.2 miles is an unpaved dirt road that would be covered with construction mats. Hauling equipment to the Project site would result in emissions of fugitive dust. Fugitive dust ( $PM_{10}$  and  $PM_{2.5}$ ) emissions were calculated using U.S. EPA AP-42 methodology for calculating unpaved road dust emissions. The following equation was used:

$$E = k \times (s/12)^a \times (W/3)^b \div (M/0.2)^c$$

Where,

E = Emission factor (pounds per mile traveled)

s = surface material silt content (percent)

W = mean vehicle weight (tons)

M = surface material moisture content (percent)

k, a, b, c = empirical constants for  $PM_{10}$  and  $PM_{2.5}$

For construction equipment mobilization, emissions were calculated without dust control measures. It is anticipated that up to eight pieces of construction equipment would be hauled to the site per day during Project mobilization.

### 5.1.2 Grading Fugitive Dust

Fugitive dust would be associated with construction activities that involve ground disturbance. Calculation of fugitive dust emissions are based on the area of disturbed ground and the fugitive dust measures implemented.

The Imperial County APCD requires that, regardless of the size of a project, all feasible standard measures for fugitive  $PM_{10}$  must be implemented at construction sites. Standard measures from the Imperial County APCD handbook are listed below.

**Standard Measures for Fugitive PM<sub>10</sub> Control:**

- a) All disturbed areas, including Bulk Material storage which is not being actively utilized, shall be effectively stabilized and visible emissions shall be limited to no greater than 20% opacity for dust emissions by using water, chemical stabilizers, dust suppressants, tarps or other suitable material such as vegetative ground cover.
- b) All on site and off site unpaved roads will be effectively stabilized and visible emissions shall be limited to no greater than 20% opacity for dust emissions by paving, chemical stabilizers, dust suppressants and/or watering.
- c) All unpaved traffic areas one (1) acre or more with 75 or more average vehicle trips per day will be effectively stabilized and visible emission shall be limited to no greater than 20% opacity for dust emissions by paving, chemical stabilizers, dust suppressants and/or watering. The transport of Bulk Materials shall be completely covered unless six inches of freeboard space from the top of the container is maintained with no spillage and loss of Bulk Material. In addition, the cargo compartment of all Haul Trucks is to be cleaned and/or washed at delivery site after removal of Bulk Material.
- d) The transport of Bulk Materials shall be completely covered unless six inches of freeboard space from the top of the container is maintained with no spillage and loss of Bulk Material. In addition, the cargo compartment of all Haul Trucks is to be cleaned and/or washed at delivery site after removal of Bulk Material.
- e) All Track-Out or Carry-Out will be cleaned at the end of each workday or immediately when mud or dirt extends a cumulative distance of 50 linear feet or more onto a paved road within an Urban area.
- f) Movement of Bulk Material handling or transfer shall be stabilized prior to handling or at points of transfer with application of sufficient water, chemical stabilizers or by sheltering or enclosing the operation and transfer line.
- g) The construction of any new Unpaved Road is prohibited within any area with a population of 500 or more unless the road meets the definition of a Temporary Unpaved Road. Any temporary unpaved road shall be effectively stabilized and visible emissions shall be limited to no greater than 20% opacity for dust emission by paving, chemical stabilizers, dust suppressants and/or watering.

Construction emission estimates account for stabilization of unpaved roads, limiting vehicle speeds on unpaved roads, track-out control devices, and replacement of ground cover based on SCAQMD's Fugitive Dust Mitigation Tables (SCAQMD 2007). The dust control efficiencies are summarized in Table 5. Note that during all construction activities, the water truck would get water directly from the IID canal immediately adjacent to the Project site and,

therefore, there would not be any emissions associated with transporting water to the Project site.

<b>Table 5 Fugitive Dust Mitigation Efficiencies</b>		
Activity	Measure	PM <sub>10</sub> Control Efficiency
Track-out	Use a gravel apron, 25 feet long by road width, to reduce mud/dirt track-out from unpaved truck exit routes.	46%
Travel over unpaved roads (15 miles per hour [mph])	Limit maximum speed on unpaved roads to 15 miles per hour.	57%
Travel over unpaved roads (25 mph)	Limit maximum speed on unpaved roads to 25 miles per hour.	44%
Water Truck	Apply water every 3 hours to disturbed areas within a construction site.	61%
Grading	Replace ground cover in disturbed areas as quickly as possible.	5%
Travel over unpaved roads	Apply chemical dust suppressant annually to unpaved parking areas.	84%
SOURCE: SCAQMD 2007		

### 5.1.3 Equipment Exhaust

The equipment anticipated to be used in Project construction was provided by the Project applicant and is shown below in Table 6.

<b>Table 6 Anticipated Construction Schedule and Equipment</b>						
Construction Equipment	Phase 1 (12 months)			Phases 2–5 (20 months)	Horse- power	Load Factor
	Bridge	Substation	Battery Storage	Battery Storage		
Wheeled Loader	--	--	1	1	97	0.37
Scraper	--	--	1	1	367	0.48
Grader	--	--	1	1	187	0.41
Dozer	--	--	1	1	247	0.40
Excavator	--	--	1	1	158	0.38
Backhoe	1	1	1	1	97	0.37
Rollers	1	1	1	1	80	0.38
Forklift	1	1	1	1	89	0.20
Crane	--	3	3	3	231	0.29
Skid Steer	--	1	2	2	97	0.37
Water Truck <sup>1</sup>	--	--	1	1	402	0.38
Drill Rig	1	--	--	--	221	0.50
NOTE: Each construction activity would also require a number of pick-up trucks. Emissions associated with pick-up trucks are included in the worker commute calculations.						
<sup>1</sup> Water truck modeled as off-highway truck.						

CalEEMod calculates emissions of all pollutants from construction equipment using emission factors from CARB's off-road diesel equipment emission factors database, OFFROAD 2011 (CARB 2011). Consistent with CARB requirements, all equipment was assumed to meet CARB Tier 3 In-Use Off-Road Diesel Engine Standards.

The Imperial County APCD requires that, regardless of the size of a project, all feasible standard measures for construction equipment must be implemented at construction sites. Standard measures from the Imperial County APCD handbook are listed below.

### **Standard Measures for Construction Combustion Equipment**

- a) Use of alternative fueled or catalyst equipped diesel construction equipment, including all off-road and portable diesel powered equipment.
- b) Minimize idling time either by shutting equipment off when not in use or reducing the time of idling to 5 minutes as a maximum.
- c) Limit, to the extent feasible, the hours of operation of heavy duty equipment and/or the amount of equipment in use.
- d) Replace fossil fueled equipment with electrically driven equivalents (provided they are not run via a portable generator set).

## **5.1.4 On-road Vehicle Emissions**

Construction would generate mobile source emissions from worker trips and material delivery (vendor) trips. As discussed, construction workers would travel along I-8 and head 4.6 miles south to the Project site, and would utilize the IID Fern Check Bridge as a pedestrian bridge until the permanent bridge is constructed. All construction equipment and material deliveries would access the site from the south until completion of the access road and bridge. As required by the Imperial County APCD standard PM<sub>10</sub> mitigation measures, to reduce dust, the unpaved access road would either be watered or a chemical dust suppressant would be applied. As shown in Table 5, use of a water truck to apply water every 3 hours would reduce emissions by 61 percent, and chemical dust suppressants would reduce emissions by 84 percent. Since the use of a water truck is less efficient at reducing dust, this was included in the emission calculations; however, either dust suppressant method may be used. A reduced speed of 15 mph was modeled. During peak construction activities for the utility-scale energy storage complex, approximately 200 workers, and 30 daily deliveries would be required.

CalEEMod calculates emissions of all pollutants from on-road trucks and passenger vehicles using emission factors derived from CARB's motor vehicle emission inventory program EMFAC2014 (CARB 2014). Vehicle emission factors were multiplied by the total estimated number of trips and the average trip length to calculate the total mobile emissions.

## **5.1.5 Construction Emission Estimates**

### **5.1.5.1 Mobilization Fugitive Dust**

Using the methodology summarized in Section 5.1.1, fugitive dust emissions were calculated. Maximum daily emissions were calculated based on up to eight pieces of equipment being delivered to the site per day. These maximum daily emissions were also calculated assuming that the 1.2-mile portion of the access road from the IV Substation to the Project site would

be covered with construction mats, and that speeds on the access road would be limited to 15 mph. Fugitive dust emissions are summarized in Table 7, and calculations are provided in Attachment 1.

<b>Table 7</b> <b>Equipment Mobilization Fugitive Dust Emissions</b> <b>(pounds per day)</b>		
Amount Delivered to Site Per Day	PM <sub>10</sub>	PM <sub>2.5</sub>
1	18	3
2	36	5
3	54	8
4	72	10
5	90	13
6	108	16
7	126	18
8	144	21

As shown in Table 7, with up to eight pieces of equipment delivered to the site per day, PM<sub>10</sub> emissions are not anticipated to exceed the threshold of 150 pounds per day. There is no construction emission threshold for PM<sub>2.5</sub>. Emissions of PM<sub>2.5</sub> are provided for informational purposes only. The results of the analysis presented in Table 7 assumes compliance with the measures presented in MM-AIR-1 below, which would ensure that impacts would be less than significant.

MM-AIR-1: The following measures would be required for construction equipment mobilization:

- The 1.2-mile portion of the access road from the IV Substation to the Project site shall be covered with construction mats.
- No more than eight pieces of construction equipment shall be delivered to the Project site in one day.
- A speed limit of 15 mph on the access road shall be enforced.

### 5.1.5.2 Construction Emissions

Construction activities would begin once the needed construction equipment has been delivered to the Project site. Maximum daily emissions associated with mobilization, the first phase, and subsequent phases two through five are summarized in Table 8. CalEEMod output files for Project construction and operations are contained in Attachment 2.

Table 8 Maximum Daily Construction Air Pollutant Emissions						
Emission Source	Maximum Daily Emissions (pounds)					
	ROG	NO <sub>x</sub>	CO	SO <sub>x</sub>	PM <sub>10</sub>	PM <sub>2.5</sub>

<b>Total</b>	<b>22</b>	<b>84</b>	<b>119</b>	<b>&lt;1</b>	<b>100</b>	<b>14</b>
<i>Significance Threshold</i>	<i>75</i>	<i>100</i>	<i>550</i>	<i>-</i>	<i>150</i>	<i>-</i>
Exceeds Threshold?	No	No	No	-	No	-
Battery Storage Phases 2-5 (January 2022 – August 2023)						
Construction Equipment	2	41	49	<1	2	2
Material Deliveries	<1	8	2	<1	7	1
Worker Trips	4	4	28	<1	48	6
<b>Total</b>	<b>7</b>	<b>52</b>	<b>79</b>	<b>&lt;1</b>	<b>58</b>	<b>9</b>
<i>Significance Threshold</i>	<i>75</i>	<i>100</i>	<i>550</i>	<i>-</i>	<i>150</i>	<i>-</i>
Exceeds Threshold?	No	No	No	-	No	-
SOURCE: Attachment 2 NOTE: Totals may vary due to independent rounding. ROG = reactive organic gas; NO <sub>x</sub> = oxides of nitrogen; CO = carbon monoxide; PM <sub>10</sub> = particulate matter with an aerodynamic diameter 10 microns or less; PM <sub>2.5</sub> = particulate matter with an aerodynamic diameter 2.5 microns or less						

As shown in Table 8, construction emissions are not anticipated to exceed the applicable significance thresholds for all criteria pollutants. The results of the analysis presented in Table 8 assumes compliance with the measures presented in MM-AIR-2 below, which would ensure that impacts would be less than significant.

MM-AIR-2: The following measures would be required for construction activities:

- The 1.2-mile portion of the southern access road from the IV Substation to the Project site shall be covered with construction mats.
- A material delivery speed limit of 15 mph on the access road shall be enforced.

- For material deliveries from the south, one of the following dust suppressant measures would be required for the 4.4-mile service road:
  - A water truck shall apply water every 3 hours, or as deliveries occur; or
  - A chemical dust suppressant shall be applied.
- For the 0.3-mile portion of the northern access route that is unpaved (south of Wixom Road to the worker parking area) one of the following dust suppressant measures would be required:
  - A water truck shall apply water every 3 hours, or as worker access occurs; or
  - A chemical dust suppressant shall be applied.
- A water truck shall apply water to all active on-site grading areas every 3 hours.

## 5.2 Operation-related Emissions

Operation-related sources of air pollutant emissions include the direct emission of criteria pollutants. Common direct emission sources include mobile sources such as project-generated traffic and area sources such as the use of landscaping equipment.

### 5.2.1 Mobile Sources

CalEEMod calculates mobile source emissions using emission factors derived from CARB's motor vehicle emission inventory program, EMFAC2014 (CARB 2014). Operation of the Project would require up to 20 employees. Assuming two one-way trips per employee, the Project would be anticipated to generate up to 40 trips per day from all maintenance and security personnel. A 20-mile trip length was modeled.

### 5.2.2 Energy Sources

CalEEMod calculated emissions associated with building electricity and natural gas usage. Energy sources are mostly associated with greenhouse gas emissions; however, there are also minimal criteria pollutant emissions from energy sources. Emissions were calculated using 2016 Title 24 Energy Code standards. This is conservative since the O&M building would be required to comply with the more recent 2019 Title 24 Energy Code, which is more energy efficient than the previous version.

### 5.2.3 Area Sources

An area source is any non-permitted stationary source of emission. Common area sources include fireplaces, natural gas used in space and water heating, consumer products, architectural coatings, dust from farming operations, landscaping equipment, and small combustion equipment such as boilers or backup generators. The Project does not include measurable amounts of fireplace use, natural gas use, consumer products, architectural coatings, or other area sources.

Routine weed abatement and landscape maintenance would occur as needed. The Project site is bounded by roads, agricultural uses, and solar generation facilities. As the Project is not

adjacent to natural lands, landscaping maintenance for maintaining a fire-clearing zone would be minimal and would result in less than measurable emissions.

## 5.2.4 Propane-Fueled Emergency Generators

As discussed in Section 1.2.2.3(b) above, the Project would include emergency backup propane-fueled generators to augment the backup battery storage capacity, as well as BTM solar power generation during rare events in which the entire facility, or portions of the facility, are disconnected from the electrical grid. The generators would be periodically tested (monthly) to maintain backup capability in the event of a grid emergency. Emissions due to emergency generator testing were calculated using emission factors provided in the generator specifications. The Project would include up to 20 propane-fueled generators. The exact testing schedule is not known at this time. For the purposes of the emission calculations, it was assumed that each of the 20 generators would be tested once per month for a total operation time of two hours each per month. If all generators were to be tested on the same day, this would be a total of 40 hours of cumulative operation time per day. Emissions were calculated using U.S. EPA AP-42 emission factors and a fuel consumption rate of approximately 23 gallons per hour, based on specifications for a representative propane-fueled generator.

## 5.2.5 Operations Emission Estimates

Table 9 provides a summary of the criteria pollutant emissions generated by the Project operations. CalEEMod output files for Project construction and operations are contained in Attachment 2. Calculations for propane-fueled emergency generator testing are provided in Attachment 3.

Table 9 Maximum Daily Operations Air Pollutant Emissions						
Emission Source	Maximum Daily Emissions (pounds)					
	ROG	NO <sub>x</sub>	CO	SO <sub>x</sub>	PM <sub>10</sub>	PM <sub>2.5</sub>
Area Sources	12	<1	<1	0	<1	<1
Energy Sources	<1	<1	<1	<1	<1	<1
Mobile Sources	1	7	13	<1	48	5
Emergency Generator Testing	1	12	7	<1	1	1
<b>Total Operations</b>	<b>14</b>	<b>19</b>	<b>20</b>	<b>&lt;1</b>	<b>48</b>	<b>6</b>
<i>Significance Threshold</i>	<i>137</i>	<i>137</i>	<i>550</i>	<i>150</i>	<i>150</i>	<i>550</i>
Exceeds Threshold?	No	No	No	No	No	No
SOURCE: Attachments 2 and 3						
NOTE: Totals may vary due to independent rounding.						
ROG = reactive organic gas; NO <sub>x</sub> = oxides of nitrogen; CO = carbon monoxide;						
PM <sub>10</sub> = particulate matter with an aerodynamic diameter 10 microns or less;						
PM <sub>2.5</sub> = particulate matter with an aerodynamic diameter 2.5 microns or less						

To ensure that fugitive dust emissions would be controlled during project operation, the following mitigation would be required.

#### MM-AIR-3: Operational Dust Control Plan:

To help reduce fugitive dust emissions from on-site unpaved roads and accumulation of small dunes during operations, an Operational Dust Control Plan (ODCP) would be prepared. The ODCP would include strategies for how dust emissions would be controlled and maintained during Project operations. The ODCP would be submitted to the Imperial County APCD for approval prior to the issuance of a Certificate of Occupancy.

## 5.3 Project-Level Impact Analysis

As discussed in Section 4.0, the California Natural Resources Agency's State CEQA Guidelines includes questions that were developed to encourage thoughtful assessment of impacts. Project impact assessment consistent with these CEQA checklist questions is provided below.

*1. Would the project obstruct or conflict with the implementation of the applicable air quality plan?*

CARB is the lead agency for preparation of the California SIP, which outlines the state measures to achieve NAAQS. CARB delegates responsibility for preparation of SIP elements to local air districts and requires local air districts to prepare Air Quality Attainment Plans outlining measures required to achieve CAAQS.

The Imperial County APCD is the air district responsible for the Project area. Applicable Imperial County APCD air quality plans include:

- Imperial County 2009 State Implementation Plan for Particulate matter Less than 10 Microns in Aerodynamic Diameter;
- Imperial County 2013 State Implementation Plan for the 2006 24-Hour PM<sub>2.5</sub> Moderate Non-attainment Area; and
- Imperial County 2017 State Implementation Plan for the 2008 8-Hour Ozone Standard.

The primary concern for assessing consistency with air quality plans is whether the project would induce growth that would result in a net increase in criteria pollutant emissions that exceeds the assumptions used to develop the plan. The criteria pollutant emission projections for the Imperial County APCD air quality plans are based on Southern California Association of Governments' (SCAG) population growth and regional vehicle miles traveled projections, which are based in part on the land uses established by local general plans. As such, projects that propose development that is consistent with the local land use plans would be consistent with growth projections and air quality plans criteria pollutant emissions estimates. In the event that a project would result in development that is less dense than anticipated by the growth projections, the project would be considered consistent with the air quality plans. In the event a project would result in development that results in greater than anticipated growth projections, the project would result in air pollutant emissions that may not have

been accounted for in the air quality plans and thus may obstruct or conflict with the air quality plans.

The existing land use designation for the Project site of Agriculture (A3) is assigned a trip generation rate of two vehicle trips per acre per day (County of Imperial 2008). Based on this trip generation rate, the 148-acre Project site would generate approximately 296 daily trips as an agricultural use. The Project proposes a General Plan Amendment and Rezone to change land use designation and zoning for the Project site from Agriculture (A3) to Industrial. As described in Section 5.2.1, Project operations would generate up to 40 trips per day, which would be less than the 296 daily trips that would be generated by the Project site as an agricultural use. Therefore, mobile source emissions associated with the Project would be less than what is accounted for in the Imperial County APCD air quality plans that originally considered the Project site as an agricultural use. Furthermore, the Project would not construct housing or other uses that would result in regional population growth. Therefore, the Project would not result in new growth beyond what was originally anticipated in SCAG's growth projections for Imperial County. Additionally, as summarized in Table 9, operation of the Project would result in emissions that are well below all applicable project-level significance thresholds. Therefore, Project emissions would be consistent with SCAG's growth projections and the Imperial County APCD's air quality plans, and impacts would be less than significant.

*2. Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?*

The Project site is in non-attainment areas for NAAQS and CAAQS for ozone and particulate matter. The majority of regional PM<sub>10</sub> and PM<sub>2.5</sub> emissions originate from dust stirred up by wind or by vehicle traffic on unpaved roads (Imperial County APCD 2009). Other PM<sub>10</sub> and PM<sub>2.5</sub> emissions originate from grinding operations, combustion sources such as motor vehicles, power plants, wood burning, forest fires, agricultural burning, and industrial processes. Ozone is not emitted directly, but is a result of atmospheric activity on precursors. NO<sub>x</sub> and ROG are known as the chief "precursors" of ozone. These compounds react in the presence of sunlight to produce ozone. Approximately 88 percent of NO<sub>x</sub> and 40 percent of ROG regional emissions originate from on- and off-road vehicles (Imperial County APCD 2010). Other major sources include solvent evaporation and miscellaneous processes such as pesticide application.

As shown in Tables 7 and 8 above, all construction-related emissions would be less than the applicable Imperial County APCD significance thresholds. The results of the analysis presented in Tables 7 and 8 assumed compliance with the measures presented in MM-AIR-1 and MM-AIR-2, which would ensure that impacts would be less than significant.

With implementation of these measures, construction emissions would be less than significant. Note that the Project is also required to comply with all Imperial County APCD standard measures for fugitive dust and construction equipment. Since the Project's construction emissions would be less than the project-level significance thresholds and would comply with all Imperial County APCD measures including Regulation VIII, the Project

would result in a less than cumulatively considerable net increase in emissions during construction. In addition, all other cumulative projects are required to comply with Regulation VIII and would also be assumed to implement mitigation measures to reduce their individual construction air quality emissions. In this way, each individual project would reduce construction emissions on a project-by-project basis resulting in less than cumulatively considerable contributions to existing criteria pollutants.

As discussed under Threshold 1, the Project would be consistent with Imperial County APCD air quality plans, which address how the region would cumulatively achieve emission standards. Implementation of MM-AIR-3 would ensure that fugitive dust emissions would be controlled during project operation. As shown in Table 9, all operation-related emissions would be less than the applicable significance thresholds.

Since the Project would not conflict with implementation of Imperial County APCD air quality plans and operational emissions would be less than the applicable project-level significance thresholds, the Project would not result in a cumulatively considerable net increase in criteria pollutants for which the region is in non-attainment of federal or state standards, and cumulative impacts would be less than significant.

*3. Would the project expose sensitive receptors to substantial pollutant concentration including air toxics such as diesel particulates?*

The term “sensitive receptor” refers to a person in the population who is more susceptible to health effects due to exposure to an air contaminant than the population at large or to a land use that may reasonably be associated with such a person. Examples include schools, day care centers, hospitals, retirement homes, convalescence facilities, and residences. The Project site is in a rural environment; there are no nearby schools, day care centers, hospitals, retirement homes, or convalescence facilities. The Project site is bounded by Westside Main Canal to the north, BLM lands to the south and west, vacant land to the east, and the Campo Verde solar generation facility to the northwest. The Imperial Valley Substation is located approximately 0.5 mile south of the southern property line of the site. There are no sensitive receptors in the immediate vicinity of the Project site. The closest sensitive receptor is a single-family residence located approximately 4,000 feet northeast of the Project site at the intersection of Wixom Road and Vogel Road.

Construction-related Diesel Particulate Matter

Construction of the Project would result in short-term diesel exhaust emissions from on-site heavy-duty equipment. Particulate exhaust emissions from diesel-fueled engines (diesel PM or DPM) were identified as a TAC by CARB in 1998. Project construction would result in the generation of DPM emissions from the use of off-road diesel construction equipment during site preparation and facility installation. Other lesser construction-related sources of DPM include material delivery trucks.

Compared to typical construction projects, construction of solar generation facilities involves fewer pieces of heavy-duty diesel construction equipment which operate over larger areas; thus, construction equipment is rarely proximate to any specific receptor for an extended period of time. Due to the limited duration of construction and the distance to the nearest

sensitive receptor (4,000 feet), DPM generated by Project construction activities is not expected to create conditions where the incremental cancer risk exceeds the Imperial County APCD's ten in one million significance threshold. Therefore, Project construction would not expose sensitive receptors to a substantial pollutant concentration, and localized air quality impacts from construction-related DPM emissions would be less than significant.

#### On-site Operation Sources

As discussed under Threshold 2, construction- and operation-related emissions would be less than the applicable significance thresholds. Solar generation facilities have been shown to emit insignificant air toxic emissions. Localized air quality impacts from Project operations would be less than significant.

#### Off-site Operation Sources – CO Hot Spots

Localized CO concentration is a direct function of motor vehicle activity at signalized intersections (e.g., idling time and traffic flow conditions), particularly during peak commute hours and meteorological conditions. Under specific meteorological conditions (e.g., stable conditions that result in poor dispersion), CO concentrations may reach unhealthy levels with respect to local sensitive land uses. CO hot spots due to traffic almost exclusively occur at signalized intersections that operate at a Level of Service (LOS) E or below. Projects may result in or contribute to a CO hot spot if they worsen traffic flow at signalized intersections operating at LOS E or F.

The Project site is in a rural environment with no signalized traffic intersections within several miles of the Project site. As discussed in Section 5.2.1, Project operations would generate up to 40 trips per day.

The Project is not in proximity to a signalized intersection and would not generate substantial traffic. Therefore, the Project would not cause or contribute to a CO hot spot. Impacts would be less than significant.

#### *4. Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?*

The potential for an odor impact is dependent on a number of variables including the nature of the odor source, distance between the receptor and odor source, and local meteorological conditions. Project construction would result in the emission of diesel fumes and other odors typically associated with construction activities. Odors are highest near the source and would quickly dissipate off the site. The nearest sensitive receptor is a single-family residence approximately 4,000 feet from the Project site. Any odors associated with construction activities would be transient and would cease upon completion. Therefore, Project construction would not generate odors adversely affecting a substantial number of people, and impacts would be less than significant.

Energy storage facilities are not known to emit odors during operation. Project operation would include inspection, maintenance, and washing activities. These processes are not

known to emit odors. Therefore, operational impacts related to odor would also be less than significant.

## 5.4 Cumulative Impact Analysis

The geographic scope of cumulative impacts for air quality would be the jurisdictional boundaries of the Imperial County APCD, who are responsible for regulating air quality and preparing and implementing the portion of the California SIP applicable to the portion of the Salton Sea Air Basin that is in Imperial County. The scopes of the applicable Imperial County APCD air quality plans cover the entirety of Imperial County and address how the region would cumulatively achieve emission standards. Therefore, an evaluation of consistency with these plans constitutes an impact analysis that is cumulative in nature. As described under Section 5.3 above, the primary concern for assessing consistency with air quality plans is whether the Project would induce growth that would result in a net increase in criteria pollutant emissions that exceeds the assumptions used to develop the plan. The existing land use designation for the Project site of Agriculture (A3) would generate approximately 296 daily trips per day as an agricultural use. Project operations would generate up to 40 trips per day, which would be less than the 296 daily trips that would be generated by the Project site as an agricultural use. Therefore, mobile source emissions associated with the Project would be less than what is accounted for in the Imperial County APCD air quality plans that originally considered the Project site as an agricultural use. Furthermore, the Project would not construct housing or other uses that would result in regional population growth beyond what was originally anticipated in SCAG's growth projections for Imperial County. Additionally, as summarized in Table 9, operation of the Project would result in emissions that are well below all applicable Imperial County APCD project-level significance thresholds. Therefore, operational Project emissions would be consistent with Imperial County APCD regional criteria pollutant emission projections and SCAG regional growth projections for Imperial County, and cumulative impacts would be less than significant.

Construction of the Project, along with construction of other cumulative projects within Imperial County, would be short term and temporary in nature. As shown in Tables 7 and 8 above, all construction-related emissions would be less than the applicable Imperial County APCD significance thresholds. Since the Project's construction emissions would be less than the project-level significance thresholds and would comply with all Imperial County APCD measures including Regulation VIII, the Project would result in a less than cumulatively considerable net increase in emissions during construction. In addition, all other cumulative projects are required to comply with Regulation VIII and would also be assumed to implement mitigation measures to reduce their individual construction air quality emissions. In this way, each individual project would reduce construction emissions on a project-by-project basis resulting in less than cumulatively considerable contributions to existing criteria pollutants. Furthermore, it is unlikely construction activities would overlap or result in a proximate concentration of emissions due to the varied schedules and distances between cumulative projects within Imperial County. Therefore, cumulative impacts related to project construction would be less than significant.

## 6.0 Conclusions and Recommendations

This report evaluates the significance of air quality emissions associated with the Project using criteria from the California Natural Resources Agency State CEQA Guidelines and the Imperial County APCD CEQA Air Quality Handbook.

A significant air quality impact would occur if the Project would conflict with the Imperial County APCD's ozone and particulate matter air quality plans. Project air pollutant emissions would be consistent with regional growth projections and the air quality plan emission forecasts, and impacts would be less than significant.

A significant air quality impact would occur if the Project would result in a cumulatively considerable net increase of any criteria pollutant for which the Project region is a non-attainment area. As calculated in this analysis, construction- and operation-related emissions would be less than all applicable significance thresholds provided mitigation measures MM-AIR-1, MM-AIR-2, and MM-AIR-3 are implemented. The Project site is in non-attainment areas for ozone, PM<sub>10</sub>, and PM<sub>2.5</sub> standards. Project ozone precursor and particulate matter emissions would be less than applicable significance thresholds. Thus, the Project would not result in a cumulatively considerable net increase of ozone precursors or particulate matter emissions, and impacts would be less than significant.

A significant air quality impact would occur if the Project would expose sensitive receptors to substantial pollutant concentration including air toxics. There are no sensitive receptors in the immediate vicinity of the Project site. The closest sensitive receptor is a single-family residence located approximately 4,000 feet northeast of the Project site at the intersection of Wixom Road and Vogel Road. The Project would result in the generation of DPM during construction and mobile-source CO during operation. Due to the limited duration of construction and the distance to the nearest sensitive receptor, DPM generated by Project construction activities is not expected to create conditions where the incremental cancer risk exceeds the Imperial County APCD's ten in one million significance threshold; thus, impacts from DPM exposure would be less than significant. Due to the limited traffic generated by the Project, the Project would not substantially contribute to elevated CO concentrations; impacts from mobile-source CO emissions would be less than significant. The various components of solar generation facilities, including storage and transmission facilities, have been shown to emit insignificant air toxic emissions. Localized air quality impacts from Project operations would be less than significant.

Project construction would result in temporary odors associated with diesel exhaust. Odors generated from construction would be temporary and intermittent, and would largely dissipate at short distances from the source. The various components of solar generation facilities, including storage and transmission facilities, are not known to emit odors during operation. Thus, the Project would not create objectionable odors adversely affecting a substantial number of people and impacts would be less than significant.

The Project would have a less than significant impact on air quality. Mitigation measures MM-AIR-1, MM-AIR-2, and MM-AIR-3 would be required along with the standard Imperial County APCD dust and equipment measures discussed in Sections 5.1.1 and 5.1.2 is required.

## 1.0 Project Characteristics

---

### 1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Light Industry	5.00	1000sqft	1.00	5,000.00	0
Unrefrigerated Warehouse-No Rail	500.00	1000sqft	147.00	500,000.00	0

### 1.2 Other Project Characteristics

<b>Urbanization</b>	Urban	<b>Wind Speed (m/s)</b>	3.4	<b>Precipitation Freq (Days)</b>	12
<b>Climate Zone</b>	15			<b>Operational Year</b>	2022
<b>Utility Company</b>	Imperial Irrigation District				
<b>CO2 Intensity (lb/MWhr)</b>	956.99	<b>CH4 Intensity (lb/MWhr)</b>	0.022	<b>N2O Intensity (lb/MWhr)</b>	0.005

### 1.3 User Entered Comments & Non-Default Data

Project Characteristics - Energy intensity factors reduced to reflect RPS 2020 mandate (956.99, 0.022, 0.005)

Land Use - 5,000 sf O&M Building  
500,000 sf storage warehouses  
148 acres

Construction Phase - Construction schedule per applicant

Off-road Equipment - Project equipment list

Off-road Equipment - Project equipment list

Off-road Equipment - Project equipment list

Off-road Equipment - Project equipment list

## 8888 Westside Canal Energy Center - Imperial County APCD Air District, Summer

Off-road Equipment - Project equipment list  
 Off-road Equipment - Construcion equipment list

Off-road Equipment - Project equipment list

Trips and VMT - Max 200 workers, 30 deliveries  
 Trip length increased to 20 miles

On-road Fugitive Dust - Workers - last 0.3 miles of 20 mile trip would be dirt road (98.5% paved)

Materials - 4.4 miles of 20 miles trip over service road (78% paved or construction mats)

Service road silt content = 4.3%

Access road dust emissions calculated separately

Grading - 148 acres

Vehicle Trips - 20 full time employees

Road Dust - Workers - last 0.3 miles of 20 mile trip would be gravel (98.5% paved)

Energy Use - No storage warehouse heating

Warehouse lighting included in aux load calculations

Water And Wastewater - 10,000 gallons per day (3,650,000 per year)  
 1,000,000 stored for fire protection

Construction Off-road Equipment Mitigation - Tier 3 engines per CARB regulations

Water exposed grading areas

Water unpaved roads (61% reduction due to water applied rather than soil stabilizer reduction of 84%)

Operational Off-Road Equipment -

Stationary Sources - Emergency Generators and Fire Pumps -

Architectural Coating - O&M Building only

Solid Waste - No additional solid waste generated by storage warehouses

Area Coating -

## Management Summary

This report provides the results of the Biological Resources Report for the Westside Canal Battery Storage Project (Project) in Imperial County, California. The total footprint encompassing permanent and temporary impacts consists of 163.32 acres of agriculturally-zoned land located in the unincorporated Mount Signal area of the County, approximately 8.0 miles southwest of the city of El Centro. The Project site is comprised of two parcels owned by Westside Canal Battery Storage, LLC (Project Proponent), a subsidiary of Con Edison Clean Energy Businesses, Assessor Parcel Numbers (APNs) 051-350-010 and 051-350-011, totaling approximately 148 acres. The two parcels are proposed for development as a utility-scale energy storage complex. The Project would also utilize portions of two parcels located north of the Westside Main Canal (APN 051-350-019 owned by the Imperial Irrigation District's (IID) and APN 051-350-018 owned by a private land owner) for site access and as a temporary construction staging area. The Project would also access a small portion of APN 051-350-009 within an IID easement for connection to the existing IID Campo Verde Imperial Valley 230 kilovolt radial gen-tie line during the construction of a substation on the Project site.

The Project site is located approximately one-third mile north of the Imperial Valley Substation (IV Substation) and directly south of the intersection of Liebert Road and the IID Westside Main Canal. The Project site is bounded by the Westside Main Canal to the north, Bureau of Land Management (BLM) lands to the south and west, and vacant private land to the east. The Campo Verde solar generation facility is located north of the Project site, across the Westside Main Canal.

The following vegetation communities or land cover types were mapped within the 163.32-acre Project site and surrounding 100-foot radius: upland mustards, fourwing saltbush scrub, creosote bush scrub, quailbush scrub, arrow weed thickets, tamarisk thickets, common reed marshes, eucalyptus groves, cattail marshes, disturbed habitat, fallow agriculture, open water, and developed land. The Project would result in impacts to 9.76 acres of five sensitive vegetation communities, comprising 6.92 acres of permanent and 2.84 acres of temporary impacts. Direct impacts comprise 6.87 acres of arrow weed thicket, 0.56 acre of tamarisk scrub, 2.15 acres of quailbush scrub, 0.14 acre of cattail marsh, and 0.04 acre of common reed marsh. Mitigation for permanent impacts could potentially be conducted on-site through restoration of the fallow agriculture and disturbed lands that occur within the temporary impact footprint. If those lands are not suitable, off-site mitigation may be required. Temporary impacts would be mitigated *in situ* either through preservation or enhancement of any impacts that were incurred during Project construction.

No sensitive plant species were observed or have a moderate or high potential to occur within the Project site; thus, there were no identified or proposed impacts or associated mitigation.

The following nine sensitive wildlife species were detected during the general and focused biological surveys conducted in 2018 and 2019 for this Project: flat-tailed horned lizard (*Phrynosoma mcalli*), ferruginous hawk (*Buteo regalis*), prairie falcon (*Falco mexicanus*),

burrowing owl, loggerhead shrike (*Lanius ludovicianus*), black-tailed gnatcatcher (*Poliophtila melanura*), LeConte's thrasher (*Toxostoma lecontei*), Abert's towhee (*Melospiza aberti*), and American badger (*Taxidea taxus*).

An additional 13 sensitive wildlife species were detected during surveys but are not expected to breed on or adjacent to the Project site: American white pelican (*Pelecanus erythrorhynchos*), double-crested cormorant (*Phalacrocorax auritus albociliatus*), great egret (*Ardea alba*), great blue heron (*Ardea herodias*), snowy egret (*Egretta thula thula*), black-crowned night heron (*Nycticorax nycticorax*), Cooper's hawk (*Accipiter cooperii*), northern harrier (*Circus hudsonius*), long-billed curlew (*Numenius americanus*), Vaux's swift (*Chaetura vauxi*), Brewer's sparrow (*Spizella breweri*), yellow-headed blackbird (*Xanthocephalus xanthocephalus*), and yellow warbler (*Setophaga petechia*).

In addition to those species recorded on site, five sensitive wildlife species were identified as having a high or moderate potential to occur within the Project site: Colorado Desert fringe-toed lizard (*Uma notata*), southwestern willow flycatcher (*Empidonax traillii extimus*), vermilion flycatcher (*Pyrocephalus rubinus*), pallid bat (*Antrozous pallidus*), and Yuma hispid cotton rat (*Sigmodon hispidus eremicus*).

The Project could result in direct impacts to individuals of and/or occupied habitat for flat-tailed horned lizard, Colorado Desert fringe-toed lizard, burrowing owl, and American badger. Direct impacts to nesting birds would be avoided by conducting pre-construction surveys. Direct impacts to flat-tailed horned lizard and Colorado fringe-toed lizard would be mitigated through pre-construction surveys, translocation, and construction monitoring. Direct impacts to burrowing owl and its habitat would be mitigated through preparation and/or implementation of the following: a habitat mitigation plan, a burrow exclusion plan, pre-construction surveys, grading restrictions, and construction monitoring. Direct impacts to American badger and its habitat would be mitigated through pre-construction surveys, den monitoring, exclusion, and construction monitoring. The remaining potential impacts are considered less than significant and would, therefore, require no species-specific mitigation measures.

Within the Project parcels, jurisdictional wetlands and waters were delineated along Westside Main Canal and associated irrigation ditches and riparian and marsh vegetation. These include 0.21 acre of U.S. Army Corps of Engineers (USACE) non-wetland waters of the U.S./California Department of Fish and Wildlife (CDFW) streambed/Regional Water Quality Control Board (RWQCB) unvegetated streambed and 9.22 acres of CDFW/RWQCB wetland waters of the state. The Project proposes permanent impacts to 0.04 acre and temporary impacts to 0.16 acre of USACE non-wetland water/CDFW streambed/RWQCB unvegetated streambed. The Project would result in permanent impacts to 6.71 acres and temporary impacts to 2.51 acres of CDFW/RWQCB wetland waters of the state. Mitigation for permanent impacts could potentially be conducted on-site through restoration of the fallow agriculture and disturbed lands that occur within the temporary impact footprint. If those lands are not suitable, off-site mitigation may be required. Temporary impacts would be mitigated in situ either through preservation or enhancement of any impacts that were incurred during Project construction.

Impacts to jurisdictional waters on-site would require a permit under Section 404 Clean Water Act from USACE and a Section 401 state water quality certification from RWQCB. In addition, a Section 1600 Streambed Alteration Agreement would also need to be authorized for impacts to CDFW resources. Mitigation ratios would be confirmed at that time.

## 1.0 Introduction

This biological resources report was prepared by RECON Environmental, Inc. (RECON) for the Westside Canal Battery Storage Project (Project) proposed by Westside Canal Battery Storage, LLC (Project Proponent), a subsidiary of Con Edison Clean Energy Businesses. The purpose of this biological resources report is to (1) document the existing biological conditions within the Project survey area; (2) evaluate the survey area and the vicinity for the potential to support sensitive biological resources; (3) provide an analysis of potential impacts associated with the proposed Project; and (4) provide a discussion of potential avoidance, minimization, and mitigation measures that may be required to reduce potential impacts to sensitive biological resources to below a level of significance.

### 1.1 Project Location

The Project would be located in the unincorporated Mount Signal area of the County, approximately 8.0 miles southwest of the city of El Centro and approximately 5.3 miles north of the U.S.-Mexico border. Figure 1 shows the regional location of the Project. The Project site is comprised of two parcels, owned by the Project Proponent, Assessor Parcel Number (APN) 051-350-010 and APN 051-350-011, totaling approximately 148 acres. These parcels have limited access corridors for vehicular traffic and are considered less desirable for agricultural production, as reflected by the last 15 years during which no farming activity has occurred.

The Project site is approximately one-third mile north of the Imperial Valley Substation (IV Substation) and directly south of the intersection of Liebert Road and the Imperial Irrigation District's (IID) Westside Main Canal. The Project site is bounded by the Westside Main Canal to the north, Bureau of Land Management (BLM) lands to the south and west, and vacant private land to the east. The Campo Verde solar generation facility is located north of the Project site, across the Westside Main Canal. The entire Project site is located in the southern half of Section 34, Township 16 South, Range 12 East, on the U.S. Geological Survey (USGS) Mount Signal, California quadrangle (USGS 1976; Figure 2). An aerial photograph of the survey area is shown on Figure 3a.

The two Project parcels are proposed for development as a utility-scale energy storage complex. The Project would also utilize portions of two parcels located north of the Westside Main Canal (APN 051-350-019 owned by IID and APN 051-350-018 owned by a private land owner) for site access and as a temporary construction staging area. The Project would also access a small portion of APN 051-350-009 within an IID easement for connection to the existing IID Campo Verde Imperial Valley 230 kilovolt (kV) radial gen-tie line during the construction of a substation on the Project site. The total proposed Project development footprint, encompassing both temporary and permanent impacts, would be approximately 163 acres.

## 1.2 Project Description

The Project Proponent is proposing to develop, design, construct, own, operate, and maintain the Project, a utility-scale energy storage complex with a capacity of up to 2,000 megawatts (MW). The Project would store energy generation from the electrical grid, and optimally discharge that energy back into the grid as firm, reliable generation and/or grid services.

The Project would be comprised of lithium-ion battery and/or flow battery energy storage facilities, a behind-the-meter solar energy facility, a new on-site 230 kV loop-in switching station, a 34.5 kV to 230 kV substation, underground electrical cables, and permanent vehicular access to and from the site over a proposed bridge spanning IID's Westside Main Canal. The proposed loop-in switching station would connect the Project to the existing IID Campo Verde-Imperial Valley 230 kV radial gen-tie line, which connects to the IV Substation and the California Independent System Operator (CAISO), approximately one-third mile south of the Project site. The Project Proponent has submitted the necessary Interconnection Request Applications to the CAISO and IID.

The Project would complement both the existing operational renewable energy facilities, as well as those planned for future development in the County, and would support the broader southern California bulk electric transmission system by serving as a firm, dispatchable resource.

The Project is pursuing the following objectives:

- To receive grid energy during beneficial market and operational periods and store that energy for future dispatch when the customer (i.e., a load-serving entity) deems it to be more valuable.
- To be a valuable resource in allowing the customer and system operators to manage the effect of intermittent renewable generation on the grid and create reliable, dispatchable generation upon demand.
- To utilize available land that has not been used for agricultural production for more than 15 years and enhance the site location by providing for permanent vehicular access.

### 1.2.1 Project Components

The Project would be constructed in three to five phases over a 10-year period, with each phase ranging from approximately 25 MW up to 400 MW per phase. Depending on the size of the battery system for a given phase, construction and commissioning (approval to operate) is anticipated to take approximately 6 to 12 months. For the purposes of this analysis, the applicant has assumed that construction activities would last for approximately 32 months to complete the full Project build-out.

Construction of the 100 MW to 200 MW first phase would include roads, a permanent clear-span bridge across the Westside Main Canal, Operations and Maintenance (O&M) facilities, water connections and water-mains, storm water retention, switching station and Project substation, legal permanent vehicle access, as well as the first energy storage facility. To access the Project site, construction workers would travel along Interstate 8 and head 4.6 miles south to the Project site, and would utilize the IID Fern Check Bridge as a temporary pedestrian bridge until the permanent bridge is constructed. During peak construction activities, approximately 200 workers and approximately 30 daily deliveries would be required. It is anticipated that construction of the first phase would begin in 2021.

It is anticipated that each subsequent phase would be constructed within one to two years of each other, with the timing and size of each phase dependent on market conditions and the applicant's ability to secure commercial contracts with prospective customers. With the Project being built in phases, the necessary infrastructure, such as water mains, retention ponds, and access roads, would be built out to serve the Project phases from west to east and expanded over time to serve each phase. These subsequent phases would require improvements such as additional substation equipment, water main and site road extension, but would not require construction of additional common facilities which would be completed during the first phase. The total nameplate (or rated capacity) capacity of the Project at full build-out (all phases completed) would be approximately 2,000 MW. On-site photovoltaic (PV) solar generation would serve as station auxiliary power and be deployed throughout the Project site, constructed during each phase.

Construction activities during all Project phases would only occur Monday through Friday, between the hours of 7:00 a.m. and 7:00 p.m. or Saturday between the hours of 9:00 a.m. and 5:00 p.m., excluding holidays, per County Ordinance.

Due to the Project site having no direct vehicular access routes, the applicant is proposing to construct roads on both the north and south sides of the Westside Main Canal on private land, and a new clear-span Imperial County-specified bridge over the Westside Main Canal. The permanent new clear-span County-specified bridge would span the Westside Main Canal to connect to a proposed access road easement on the north side of the Westside Main Canal. The north side proposed access road would ultimately connect the Project to county road (CR) Liebert Road.

Construction of the permanent clear-span bridge spanning the IID's Westside Main Canal requires the Project Proponent to have access to both the north side and the south of the canal to perform the necessary construction activities. In addition to being necessary to facilitate construction of the new permanent clear-span bridge, access from the south side of the canal would allow the Project Proponent to commence construction on the first phase of the Project simultaneously, thereby shortening the duration of construction and potentially minimizing the associated impacts. The Project Proponent is evaluating various options for temporary construction access, including accessing the Project site from the south side of the Westside Main Canal off State Route 98, as well as options involving access from the north side of the Westside Main Canal from Interstate 8.

Option 1 would use the existing SDG&E maintenance road off Highway 98, which extends approximately 4.4 miles to the IV Substation. Option 1 would then continue along an existing 1.2-mile-long dirt access road that leads north, then east, outside the western and northern boundaries of the substation. Option 1 then continues northwest along an existing dirt access road that parallels two power lines until the access road connects with the western edge of the Project. The existing dirt road was constructed for the construction and maintenance of the existing Centinela gen-tie line. Option 2 would use the existing IID Westside Mail Canal access road. The selected temporary access option would be used until construction of the permanent bridge is completed. Both temporary construction access routes are presented in Figure 3b.

The 4.4-mile segment of Option 1 consisting of the SDG&E maintenance road off Highway 98 is a graded and improved dirt road. Therefore, use of this roadway segment would impact any biological resources. Potential impacts on biological resources associated with use of the 1.2-mile-long dirt access road segment of Option 1 have been analyzed in the Addendum to the Biological Resources Report for the Westside Canal Battery Storage Project, Imperial County, California (Attachment 1). The IID Westside Mail Canal access road that would be used under Option 2 is a graded and improved dirt road. Therefore, use of this roadway segment would not impact any biological resources.

## 1.2.2 Common Facilities

The northwest area of the Project serves as the location for the common facilities, which include switching station and substation and the O&M facilities. With the Project being built in phases, the necessary infrastructure, such as water mains, retention ponds, and access roads, would be built out to serve the Project phases from west to east and expanded over time to serve each phase.

A summary of the common facilities is presented below:

- 230 kV loop-in switching station
  - Connection to Campo Verde Imperial Valley 230 kV radial transmission line
  - Located on applicant property
- Project substation
- O&M facilities
- Project parking
- Storm water detention basins
- Fencing and gates
- Interior access roads

FIGURE 3b  
Temporary Construction Access Routes

Industrial buildings, warehouses, engineered containers, and/or electrolyte storage tanks would be the primary structures needed to house the main Project components. Other components to be located on the Project site and adjacent to the proposed buildings, warehouses, containers, and tanks include the following:

- Inverters, transformers, power distribution panels
- Underground water-main loop for Project operation and fire prevention
- Underground cable to connect to Project substation
- Project site access roads (unpaved/crushed rock)
- Fire water storage tanks
- Above ground water storage tanks
- Heating, ventilation, and air conditioning (HVAC) units
- Ground-mounted or roof-mounted PV arrays
- Emergency backup generator(s)

The O&M facilities are expected to be the only manned facility on the site. It would include up to approximately 20 full-time employees depending upon the number of phases and type of energy storage facility constructed. O&M employees would work typical weekday hours but may work extended hours, including weekends and 24 hours a day, depending upon the operations and maintenance needs. No offices or staffed control centers would be located within the storage-specific warehouses/buildings. For sanitary waste, the Project would include a septic leach field to be located near the O&M facilities. The proposed O&M facilities would also require an HVAC unit.

## 2.0 Methods and Survey Limitations

Biological resource data for the Project was obtained from a combination of literature review, general biological survey, and focused biological surveys. Focused surveys were conducted for the following resources/species: burrowing owl (*Athene cunicularia*), jurisdictional wetland/waters, and rare plants (Table 1). The literature review and survey methods are discussed below.

Focused burrowing owl and rare plant surveys were conducted at appropriate times of year to detect presence/absence of target species, and the combined biological surveys covered all four seasons. Therefore, the likelihood of detection of migrants and seasonal visitors was high. Surveys were limited by temporal factors, as all surveys were conducted during the day or dusk. As a result, some nocturnal animals were observed directly as dusk turned to night following burrowing owl surveys, and others were detected by sign such as tracks, scat, and/or burrows; however, a full suite of nocturnal animals may have required full night-time surveys or trapping.

**Table 1**  
**Biological Survey Schedule Summary**

Date	Survey Type and Number	Surveyor(s)	Beginning Conditions	Ending Conditions
4/5/2018	BUOW Habitat Assessment	B. Ogg, B. Rigley, A. Fromer, B. Parker	09:25; 82°F; 2–4 mph wind; sunny	14:00; 94°F; 2–5 mph wind; 50% high, thin cloud cover
4/13/2018	BUOW Breeding Season Survey 1	B. Ogg, B. Rigley, A. Fromer, S. Vargas	17:20; 81°F; 2–9 mph wind; clear sky	19:36; 70 °F; calm wind; clear sky
4/14/2018			06:00; 55°F; 0–2 mph wind; clear sky	09:55; 78°F; 1–3 mph wind; clear sky
5/7/2018	BUOW Breeding Season Survey 2	B. Ogg, B. Rigley, S. Vargas, K. Israel	17:45; 95°F; 1–4 mph wind; 0% cloud cover, slight haze	19:55; 92 °F; 2–9 mph wind; 0% cloud cover, slight haze
5/8/2018			05:25; 67°F; 2–4 mph wind; 0% cloud cover, slight haze	09:20; 88°F; 2–6 mph wind; 75% high, thin cloud cover
5/29/2018	BUOW Breeding Season Survey 3	B. Ogg, B. Rigley, A. Smisek, K. Valenti	17:45; 99°F; 1–3 mph wind; 30% cloud cover	20:11; 94°F; 4–11 mph wind; 20% cloud cover
5/30/2018			05:20; 68°F; 2–4 mph wind; 2% cloud cover	09:45; 93°F; 2–6 mph wind; 1% cloud cover with haze
7/5/2018	BUOW Breeding Season Survey 4	B. Ogg, A. Fromer, K. Valenti, V. Novik	17:55; 108°F; 1–5 mph wind; 15% high, thin cloud cover	20:22; 100°F; calm wind; 5% high, thin cloud cover
7/6/2018			05:15; 83°F; 2–4 mph wind; 25% cloud cover	09:35; 103°F; 1–3 mph wind; 40% cloud cover
10/4/2018	BUOW Non-breeding Season Survey 1	B. Ogg, B. Parker, E. Procsal, M. Weston, V. Novik	16:22; 89°F; 5–10 mph wind; 5% cloud cover	19:36; 84 °F; 5–10 mph wind; 5% cloud cover
10/5/2018			06:14; 69°F; 3–6 mph wind; clear sky	09:55; 82°F; 5–12 mph wind; <1% cloud cover
11/8/2018	BUOW Non-breeding Season Survey 2	B. Ogg, B. Parker, E. Procsal, M. Weston, J. Sundberg	14:45; 82°F; 6–12 mph wind; 0% cloud cover	19:11; 74 °F; 2–7 mph wind; 0% cloud cover
11/9/2018			05:41; 51°F; 0–2 mph wind; 0% cloud cover	10:00; 78°F; 0–7 mph wind; 0% cloud cover
12/6/2018	BUOW Non-breeding Season Survey 3	B. Ogg, B. Parker, E. Procsal, M. Weston, K. Valenti	14:38; 70°F; 0–1 mph wind; 0% cloud cover	17:05; 59°F; 0–1 mph wind; 0% cloud cover
12/7/2018			06:11; 45°F; 0 mph wind; 15% cloud cover	10:00; 59°F; 0–2 mph wind; 90% cloud cover
1/24/2019	BUOW Non-breeding Season Survey 4	B. Ogg, B. Parker, E. Procsal, M. Weston, K. Valenti	15:07; 71°F; 3–6 mph wind; 85% cloud cover	17:33; 61°F; 0–2 mph wind; 10% cloud cover
1/25/2019			06:15; 46°F; 0–2 mph wind; 5% cloud cover	10:00; 69°F; 0–2 mph wind; <1% cloud cover
2/5/2019	General Biological Survey	B. Ogg, K. Valenti, J. Sundberg	--	--
	Wetland/Waters Delineation	A. Smisek	--	--
4/23/2019	Rare Plants Survey	J. Sundberg	--	--

BUOW = burrowing owl; °F = degrees Fahrenheit; mph = miles per hour; % = percent.

According to precipitation data for the closest available location, Imperial, California, observed precipitation was below normal for the 2017-2018 wet season (National Climate Data Center [NCDC] 2019a, National Weather Service [NWS] 2019), which likely resulted in low germination rates for annual plant species in winter and spring 2018 within the Project vicinity at the time the Project survey effort commenced. However, observed precipitation was approximately at normal for the 2018-2019 wet season. Specifically, the normal (1981-2010) precipitation recorded for Imperial, California, for September through March is

2.47 inches, and the observed precipitation for Imperial, California, for September 2018 through March 2019 was 2.48 inches (NCDC 2019b, NWS 2019). Therefore, sensitive annual plant species would have likely been detected if present during the general biological and focused rare plant surveys conducted in winter and spring 2019.

Zoological nomenclature is in accordance with the Checklist of North and Middle American Birds (Chesser et al. 2018); Scientific and Standard English Names of Amphibians and Reptiles of North America North of Mexico (Crother et al. 2012); the Revised Checklist of North American Mammals North of Mexico (Baker et al. 2003); Page et al. (2013) for fish; and Evans (2008), Wheeler and Wheeler (1973), San Diego Natural History Museum (SDNHM; 2002), and AntWeb (2018) for insects and spiders. Floral nomenclature for common plants follows Baldwin (2012) as updated by the Jepson Online Interchange (University of California 2019) and for sensitive plants the California Native Plant Society online database (CNPS; 2019). If a plant's common name was not provided in these resources, common names were obtained from Rebman and Simpson (2014), or the U.S. Department of Agriculture (USDA) maintained database (USDA 2013) or the Sunset Western Garden Book (Brenzel 2001) for ornamental/horticultural plants.

## 2.1 Literature Review

RECON conducted an analysis of existing sensitive species data recorded within two miles of the Project site. This analysis included searches of the California Natural Diversity Database (CNDDB; California Department of Fish and Wildlife [CDFW] 2019a), the All Species Occurrences Database (U.S. Fish and Wildlife Service [USFWS] 2019), and a search of the CNPS online rare plants database within nine USGS quadrangles surrounding the site (CNPS 2020). Additional maps, imagery, and databases reviewed included USGS topographic maps (1976), soils survey maps (USDA 1981, 2017), online aerial satellite imagery (Google Earth 2018), the Consortium of California Herbaria (2019), and the Amphibian and Reptile Atlas of Peninsular California (SDNHM 2019). RECON also conducted a review of existing literature relevant to the biological resources known from the vicinity of the Project site, including but not limited to the following:

- Final Biological Technical Report for the Campo Verde Solar Project (Heritage Environmental Consultants 2012a);
- Campo Verde Solar Energy Project Protocol Burrowing Owl Survey Report, Phase I, II and III Survey Report (2011 Breeding and 2011/2012 Winter Resident) (Heritage Environmental Consultants 2012b);
- Campo Verde Solar Project Jurisdictional Waters Report (Heritage Environmental Consultants 2012c);
- Campo Verde Solar Avian Survey Report 2011-2012 (Heritage Environmental Consultants 2012d);
- Campo Verde Solar Energy Project Protocol Burrowing Owl Survey Report, Phase I, II and III Survey Report (2012 Breeding Season) (Heritage Environmental Consultants 2012e);

- Post Survey Notification of Focused Survey Results for the Mountain Plover on the Campo Verde Solar Energy Project (Heritage Environmental Consultants 2012f); and
- Imperial County Conservation and Open Space Element (County of Imperial 2016).

Additional species not found during the records search were assessed if the range for that species extended into the Project site and habitat conditions within the Project site were potentially suitable for that species. Determination of the potential occurrence for sensitive species was based upon known ranges and habitat preferences for the species (Jennings and Hayes 1994; Unitt 2004; CDFW 2019a; Baldwin et al 2012; Jepson Flora Project (eds.) 2019, CNPS 2019; Reiser 2001; Tremor et al. 2017; Western Bat Working Group 2017; Harvey et al. 2011).

## 2.2 General Biological Survey

RECON biologists Brenna Ogg, Bernadette Rigley, Alex Fromer, and Brian Parker conducted initial vegetation mapping as part of the burrowing owl habitat assessment on April 5, 2018, and refined the vegetation mapping during the burrowing owl non-breeding season surveys conducted between October 4, 2018, and January 25, 2019 (see Section 2.3). Vegetation community classifications followed Sawyer et al. (2009). For areas that did not fall into one of the vegetation classifications defined by Sawyer et al. (2009), one of the following land cover types were used: developed, active agriculture, fallow agriculture, open water, and disturbed habitat. Dominant plant species, average height, and density were noted for each vegetation community. Digital photographs of representative areas were taken during the reconnaissance survey.

RECON biologists Ms. Ogg, JR Sundberg, and Kayo Valenti conducted a general biological survey of the Project site and surrounding 100-foot buffer (survey area) on February 5, 2019, between 11:00 a.m. and 3:00 p.m. The survey area totaled 163.3 acres (see Figure 3a). At the time of this survey, full access had been granted to areas within the Project boundary; however, direct access to the majority of the 100-foot buffer was unavailable. Therefore, areas within the Project boundary were accessed directly on foot, and most areas within the surrounding 100-foot buffer were surveyed from the edge of the Project boundary, using binoculars when necessary. Weather conditions during the survey consisted of 40 to 50 percent cloud cover, 5- to 16-mile-per-hour winds averaging 8 to 13 miles per hour, and air temperatures between 63 and 65 degrees Fahrenheit. The biologists inventoried plant and wildlife species, conducted a search for sensitive species, and assessed the suitability of habitat for sensitive species identified as having potential to occur based on the literature review discussed above.

## 2.3 Burrowing Owl Surveys

RECON conducted a burrowing owl habitat assessment, breeding season surveys, and non-breeding season surveys between April 2018 and January 2019 (see Table 1). The survey area used for the burrowing owl habitat assessment and surveys includes the Project site and the surrounding 150 meters (492 feet) (see Figure 3a). Methods used for the burrowing owl habitat assessment, breeding season surveys, and non-breeding season surveys followed the

guidelines set forth by CDFW (2012) and are summarized below. Complete survey methods are provided in the focused survey reports prepared by RECON (2018, 2019a).

Direct access was consistently available to the Project Proponent-owned parcels south of Westside Main Canal, the canal roads (including Mandrapa Road), and Liebert Road. However, access to the parcels north of Westside Main Canal and the parcels adjacent to the Project Proponent-owned parcels was limited to varying degrees throughout the survey periods. Therefore, the Project site south of Westside Main Canal, was consistently surveyed using line transects, while the majority of the survey area north of Westside Main Canal and the entirety of the 150-meter buffer south of Westside Main Canal were surveyed by using binoculars or scopes.

The habitat assessment began with a review of relevant biological information to provide local and regional context, document known occurrences of the species within the Project vicinity, and identify potentially suitable burrowing owl habitat within and adjacent to the Project site. Following the desktop review, RECON biologists Ms. Ogg, Bernadette Rigley, Alex Fromer, and Brian Parker conducted the habitat assessment on April 5, 2018 (see Table 1). The biologists assessed vegetation types, height, and density; land use; presence or absence of friable soils, burrows; topography; hydrological features; and presence or absence of burrowing owl sign.

Burrowing owl breeding season surveys included four visits between April 13 and July 6, 2018, during the burrowing owl's breeding season (see Table 1). Each survey was conducted by four biologists over a two-day period, between two hours before sunset and civil dusk on the first day and between civil dawn and 10:00 a.m. on the second day. Surveys were spaced at least three weeks apart. All wildlife species observed during the surveys were noted, and all suitable burrows were recorded using a handheld global positioning system (GPS) device.

Similarly, non-breeding season surveys included four visits between October 4, 2018, and January 25, 2019, outside the burrowing owl's breeding season. Each survey was conducted by five biologists over a two-day period, between two hours before sunset and civil evening twilight on the first day and between morning civil twilight and 10:00 on the second day. Surveys were spaced at least four weeks apart. All wildlife species observed during the surveys were noted. All suitable burrows were recorded using a handheld GPS device, and presence or absence of burrowing owl sign (e.g., pellets, whitewash, prey remains, feathers, or decoration) was documented.

## 2.4 Jurisdictional Waters/Wetland Delineation

On February 5, 2019, Mr. Smisek conducted a routine jurisdictional waters/wetland delineation, following the guidelines set forth by the U.S. Army Corps of Engineers (USACE; 1987 and 2008), to gather field data at locations with potential jurisdictional waters in the Project site and surrounding 100-foot radius. Prior to conducting the delineation, aerial photographs, USGS topographic maps of the site, USDA soil maps of the site, and the USFWS National Wetland Inventory were examined. Once on-site, potential federal and state jurisdictional areas were examined to determine the presence and extent of any jurisdictional

waters. Complete survey methods are provided in the Jurisdictional Waters/Wetland Delineation Report for the Westside Canal Battery Storage Complex Project, Imperial County, California (RECON 2019b).

## **2.5 Rare Plants Surveys**

RECON staff conducted an initial search for rare plant species as part of the general biological survey discussed above (see Section 2.2). Mr. Sundberg conducted a second focused survey for rare plants within the Project site on April 23, 2019, between 10:15 a.m. and 2:10 p.m. (see Table 1). The survey was conducted in spring, during the typical blooming period for most potentially occurring species so that the detectability of these species was maximized.

The Project site was traversed on foot with a focus on the fallow agriculture areas in the Project site north of Westside Main Canal, and the western and southwestern portions of the Project site, where native habitat has re-established within the abandoned agricultural fields south of Westside Main Canal as these are areas with a higher expectation of supporting rare plants. As with the general biological survey, a species list of all plants observed was compiled during the course of the survey.

## **3.0 Survey Results/Existing Conditions**

This section describes the existing physical and biological conditions of the Project site and surrounding area. This includes a summary of land use, topographical features, soils, and hydrological features observed during biological surveys conducted between April 5, 2018, and February 5, 2019.

### **3.1 Physical Characteristics**

#### **3.1.1 Existing Land Use**

The main Project site south of Westside Main Canal (i.e., the Project Proponent-owned parcels) consists of agriculturally-zoned land that was previously used for agriculture but has remained inactive since at least 2003. The portion of the Project area that lies north of Westside Main Canal includes parcels owned by the IID and a private land owner, that were also previously used for agriculture and has remained inactive since at least 2013. This inactivity has resulted in the natural, wind-driven deposition of sand and/or re-establishment of native and non-native vegetation within large portions of the old agricultural fields.

The Project site is surrounded by undeveloped BLM land to the south and west and privately-owned land to the north and east.

Infrastructure that occurs within the Project site includes the Westside Main Canal; a concrete-lined irrigation channel; a 230 kV single-circuit IID distribution line and the Campo Verde 230 kV radial transmission line along with their associated easements and

maintenance roads; and Liebert Road, which is a County road. Within the Project site, all infrastructure associated with the previous agriculture operations south of Westside Main Canal has been removed or is deteriorated and non-functional.

Current activities on site are minimal and largely limited to the land the north of Westside Main Canal. These activities comprise IID, Customs and Border Protection (CBP), agricultural operations, and occasional fishing activity along the Westside Main Canal. IID activity includes vehicle travel along the Westside Main Canal roads (including Mandrapa Road) and Liebert Road. Due to the site's proximity to the U.S.-Mexico border, CBP likely travels through the Project site, although no CBP activities were observed on-site during any of the biological surveys. Infrequent vehicle activity associated with the active agriculture was observed on Liebert Road and Mandrapa Road, north of Westside Main Canal.

### 3.1.2 Topography and Soils

The Project site is located in the Yuha Basin of the Colorado Desert.

Elevation ranges from sea level in the far southwestern corner to -24 feet in the northeastern corner. Topography within the Project site is generally level, with the exception of human-made berms along the boundaries of the inactive and active agricultural areas and small dunes and sandy hummocks that occur west and south of the Project site, as well as within the western and southwestern portions of the Project area, where the native desert habitat is re-establishing.

The following 10 soil types are mapped within the Project site and surrounding 100-foot radius and are listed in the approximate order of prevalence: Vint loamy very fine sand, wet; Vint and Indio very fine sandy loams, wet; Imperial-Glenbar silty clay loams, wet, 0 to 2 percent slopes; Meloland very fine sandy loam, wet; Rositas fine sand, wet, 0 to 2 percent slopes; Meloland fine sand; Glenbar complex; Indio-Vint complex; Rositas fine sand, 0 to 2 percent slopes; and Holtville silty clay, wet (USDA 1981). The soil series to which these soil types belong are very deep, range from moderately-well-drained to somewhat excessively-drained, and formed in alluvial and/or eolian materials on flood plains and alluvial basins, terraces, and/or sandhills (USDA 1981).

### 3.1.3 Hydrology

The Project site is within the Salton Sea Transboundary Watershed in the Colorado River Basin Region (State of California Water Boards 2018). Westside Main Canal is a human-made, natural-bottomed canal conveying water from the All-American Canal to the Imperial Valley area for irrigation use. It crosses through the northern portion of the Project site, flowing east to west. Within the survey area, a drop structure, known as the Fern Check structure, occurs within the canal and regulates water levels. During the February 2019 survey, water levels were regulated at approximately 18 inches below the top of the bank east of the drop structure, and approximately 5 feet below the top of the bank west of the drop structure. In addition to the Westside Main Canal, the east-west concrete-lined channel

mentioned above and a concrete-lined channel extending north-south in the northeast portion of the survey area contained flowing water at the time of the survey.

Manufactured drainage ditches, both concrete-lined and natural-bottomed, occur along berms that define the boundaries of abandoned agricultural fields throughout the Project site, south of Westside Main Canal. However, these drainage ditches are non-functional. No other portions of the Project site or surrounding 100-foot radius contain topographic bottomlands where a substantial amount of water could concentrate and/or flow. No hydrology indicators were observed aside from the surface water within the Westside Main Canal and the two continuously active concrete-lined irrigation channels.

## 3.2 Biological Resources

### 3.2.1 Botanical Resources

The following vegetation communities and land cover types were mapped within the Project site and surrounding 100-foot radius: upland mustards (*Brassica* spp. and Other Mustards Semi-Natural Herbaceous Stands), fourwing saltbush scrub (*Atriplex canescens* Shrubland Alliance), creosote bush scrub (*Larrea tridentata* Shrubland Alliance), quailbush scrub (*Atriplex lentiformis* Shrubland Alliance), arrow weed thickets (*Pluchea sericea* Shrubland Alliance), tamarisk thickets (*Tamarix* spp. Semi-Natural Shrubland Stands), common reed marshes (*Phragmites australis* Herbaceous Alliance and Semi-Natural Stands), eucalyptus groves (*Eucalyptus* spp. Semi-Natural Woodland Stands), cattail marshes (*Typha* sp. Herbaceous Alliance), disturbed habitat, fallow agriculture, open water, and developed land (Table 2). A brief description of each community or land cover type is also provided below in order of prevalence within the Project site and surrounding 100-foot radius.

Table 2 Vegetation Communities/Land Cover Types within the Project Site and Surrounding 100-foot Radius (acres)		
Community or Type	Project Area	100-foot Buffer
upland mustards	74.70	0.97
fourwing saltbush scrub	47.74	2.52
fallow agriculture	13.56	1.40
arrow weed thickets	6.87	2.01
creosote bush scrub	6.43	10.47
disturbed habitat	5.77	7.36
tamarisk thickets	5.26	1.34
quailbush scrub	2.15	1.33
eucalyptus groves	0.58	--
cattail marshes	0.14	--
open water	0.10	5.75
common reed marshes	0.04	2.42
developed land	0.00	1.63
<b>Total</b>	<b>163.32*</b>	<b>37.20</b>
*Total acreage varies from sum of cells due to rounding.		

A minimum of 46 plant species was observed within the Project site and surrounding 100-foot radius, with 28 species (61 percent) considered native and the remaining 18 species

(39 percent) considered non-native and/or naturalized into the area. Dominant plant species are discussed by vegetation community below, and a complete list of plant species detected is included as Attachment 2. Figure 4 illustrates the vegetation mapped within the 100-foot radius. Active agriculture is present beyond the 100-foot radius but within the larger 150-meter buffer that was surveyed as part of the burrowing owl surveys. These are not accounted for in Table 2 or Figure 4, but can be seen in the aerial in the northwestern corner.

### **3.2.1.1 Upland Mustards**

Upland mustards is the predominant vegetation community within the Project site and is primarily found south of Westside Main Canal. The vegetation is open and low-growing, and comprises a mix of non-native and native annual plant species. Total vegetative cover ranges between 10 and 40 percent, with London rocket (*Sisymbrium irio*) as the dominant species. Other common plants include the native narrow-leaf cryptantha (*Cryptantha angustifolia*) and non-native Mediterranean schismus (*Schismus barbatus*). Native annuals such as yellow cups (*Chylismia brevipes*) and brown-eye primrose (*Chylismia claviformis*) are scattered in low numbers.

### **3.2.1.2 Fourwing Saltbush Scrub**

Fourwing saltbush scrub is the predominant vegetation community within the western and southwestern portions of the Project site south of Westside Main Canal. An additional linear stand of this community parallels the south side of the Westside Main Canal access road in the eastern half of the Project site. Total shrub cover ranges between 10 and 40 percent, and shrub height averages three to four feet. The dominant shrub species is fourwing saltbush with scattered creosote occurring within the southernmost stand in the Project site.

Herbaceous cover is approximately 15 percent and comprises low-growing native and non-native annuals, including narrow-leaf cryptantha, London rocket, and Mediterranean schismus with the addition of desert indianwheat (*Plantago ovata*) in the southwestern stand.

FIGURE 4

Existing Biological Resources

### 3.2.1.3 Creosote Bush Scrub

Creosote bush scrub largely occurs in the areas along the west, south, and southeast boundaries of the Project site, south of Westside Main Canal. This community occurs in the desert areas that have been subjected to minimal historical disturbance and has begun to re-establish along the edges of the Project site since abandonment of the agricultural fields. Outside the Project site, total shrub cover averages between 20 and 30 percent, and shrub height averages five to six feet. Within the Project site, shrub density is lower and height is shorter at approximately 10 percent and three feet, respectively. Creosote is the dominant shrub species throughout this community. Alkali goldenbush (*Isocoma acradenia* var. *eremophila*) occurs as a subdominant shrub species in the southeastern stand, where lateral seepage from Westside Main Canal has resulted in a higher water table.

Fourwing saltbush is scattered throughout the majority of this community in the drier western and southern stands. Herbaceous cover is low, reaching 20 percent cover in some areas, and includes low-growing native annuals and bulbs such as yellow cups, brown-eye primrose, narrow-leaf cryptantha, and desert lily (*Hesperocallis undulata*).

### 3.2.1.4 Fallow Agriculture

Fallow agriculture is the predominant land type cover in the portion of the Project site north of Westside Main Canal, where the land previously was used for agriculture but has remained inactive since at least 2013. These areas support 10 to 80 percent cover of herbaceous vegetation, heavily dominated by non-native Bermuda grass (*Cynodon dactylon*) and averaging one foot high. Scattered non-native annuals Mediterranean schismus and prickly lettuce (*Lactuca serriola*) occur throughout, and native alkali goldenbush shrubs occur in low numbers in the western portion of this cover type.

### 3.2.1.5 Disturbed Habitat

Disturbed habitat consists of bare ground and dirt roads (i.e., canal roads, Liebert Road) that are subjected to continued disturbance, preventing establishment of substantial vegetation cover. The few plants that occur within or along the edges of these areas include alkali heliotrope (*Heliotropium curassavicum*) along the canal roads, London rocket, and nettle-leaf goosefoot (*Chenopodium murale*).

### 3.2.1.6 Arrow Weed Thickets

Arrow weed thickets occur in five different patches, the majority of which occur as linear stands paralleling Westside Main Canal and an active concrete-lined irrigation channel in the northern portion of the Project site (see Figure 4). The largest stand occurs at the eastern edge of the Project site, continues off site to the east and south, and may have developed as a result of lateral seepage of water from Westside Main Canal. Arrow weed dominates this vegetation community at approximately 50 percent cover. Occasional saltcedar (*Tamarix ramosissima*) shrubs or trees occur within this vegetation community, and the understory

consists of a sparse cover of non-native mustards and narrow-leaf cryptantha in openings between shrubs.

### 3.2.1.7 Tamarisk Thickets

Tamarisk thickets occur several distinct stands, including linear patches along a network of berms and irrigation ditches that likely were manufactured for agriculture use but have since been abandoned, as well as clusters of trees along the southern boundary of the Project site. These patches of tamarisk thickets are dominated by either saltcedar with an approximate cover of 30 percent, or athel (*Tamarix aphylla*) with an approximate cover of 80 percent. The patches of athel were likely planted as a wind screen when the site was used for agriculture.

One patch of tamarisk thicket occurs within an abandoned agriculture field in the southeast portion of the survey area and contains sparse, shrub-sized saltcedar at approximately 10 percent cover. These individuals likely established naturally but currently appear to be stressed with substantially diminished canopies.

One additional stand parallels the access road along the south side of Westside Main Canal; this patch is dominated by saltcedar at approximately 50 percent cover. The saltcedar individuals in this northern patch appear mature and robust.

### 3.2.1.8 Open Water

Areas of open water occur within the Westside Main Canal and one concrete-lined irrigation channels. Although most portions of the open water do not contain any plants, the east-west concrete-lined channel north of the Westside Main Canal contains portions with a moderate accumulation of coontail (*Ceratophyllum demersum*) and long filamentous algae. Cover of aquatic plants within this channel is less than 5 percent; therefore, the channel is considered unvegetated.

### 3.2.1.9 Quailbush Scrub

Quailbush scrub occurs in two stands north of Westside Main Canal and west of Liebert Road. At approximately 50 percent cover, quailbush dominates this vegetation community. The understory is mostly bare, with sparse cover of upland herbaceous species such as Bermuda grass and London rocket. The eastern patch of quailbush scrub is small and surrounded by arrow weed thickets and disturbed habitat, and occurs with a small patch of eucalyptus groves. The western patch of this vegetation community is larger, extending north and west beyond the 100-foot radius of the Project site. Both patches occur within areas that appear to have been used historically for agriculture but have since remained fallow. Manufactured berms and ditches occur along much of the perimeters of the patches.

### 3.2.1.10 Common Reed Marshes

Common reed marshes occur as linear stands averaging between 5 and 10 feet in width along the banks of Westside Main Canal. This vegetation community is dominated by common reed, which comprises approximately 35 percent cover. Arrow weed occurs in most portions of this

vegetation community as a subdominant species at approximately 5 percent cover. The banks of the canal are steep and contain a substantial proportion of large rock and pieces of concrete. Although common reed growth occurs both along the slope and on top of the banks, no growth occurs from portions of the bank at or below the water level.

### 3.2.1.11 Developed Land

Developed land is mapped within the 100-foot radius immediately north of the Project site and comprises solar PV development.

### 3.2.1.12 Eucalyptus Groves

The on-site eucalyptus grove comprises one small cluster of eucalyptus trees in the northern portion of the Project site, adjacent to the intersection of Liebert Road and Mandrapa Road, north of Westside Main Canal. The trees are mature, 30 to 50 feet tall, and include coolibah (*Eucalyptus microtheca*).

### 3.2.1.13 Cattail Marshes

Cattail marshes occur only within the small, concrete-lined irrigation channel extending east-west north of Westside Main Canal. This vegetation community is dominated by southern cattail (*Typha domingensis*). However, it appears this vegetation was dug out of the irrigation channel prior to the February 2019 survey, as the removed cattails were observed piled nearby.

## 3.2.2 Zoological Resources

A total of 127 animal species were detected within the Project site and surrounding areas (within 150-meter [500-foot] radius) during the 2018 and 2019 biological surveys. These comprise 25 invertebrates, 1 amphibian, 7 reptiles, 84 birds, and 10 mammals typical of Colorado Desert communities and agricultural areas, and are summarized below. A complete list of animal species detected during the 2018 and 2019 surveys is included as Attachment 3. Sensitive animal species observed are discussed in Section 3.3.4.

### 3.2.2.1 Invertebrates

Invertebrates detected during the 2018 and 2019 surveys include common insects such as mosquito (*Culex* sp.), darkling beetle (not identified to species), tarantula hawk (*Pepsis* sp.), honey bee (*Apis* sp.), and cicada (not identified to species); scorpion (not identified to species; detected by tracks); three ant species including California harvester ant (*Veromessor stoddardi*) and black harvester ant (*Veromessor pergandei*); eight butterfly or skipper species including painted lady (*Vanessa cardui*), western pygmy-blue (*Brephidium exile*), orange sulphur (*Colias eurytheme*), and fiery skipper (*Hylephila phyleus muertovalle*); and two dragonflies, roseate skimmer (*Orthemis ferruginea*) and Mexican amberwing (*Perithemis intense*).

### 3.2.2.2 Amphibians and Reptiles

One invasive amphibian species, American bullfrog (*Lithobates catesbeiana*), was detected during the 2018 and 2019 biological surveys.

The following five reptile species were observed: western banded gecko (*Coleonyx variegatus variegatus*), western zebra-tailed lizard (*Callisaurus draconoides rhodostictus*), long-tailed brush lizard (*Urosaurus graciosus*), Great Basin tiger whiptail (*Aspidoscelis tigris tigris*), and Colorado Desert sidewinder (*Crotalus cerastes laterorepens*). In addition, turtle tracks were observed near Westside Main Canal and likely belong to spiny softshell turtle (*Apalone spinifera*), which is an introduced species known to occur in the area (Daniel and Morningstar 2019). Flat-tailed horned lizard (*Phrynosoma mcallii*) is also assumed present within the Project site based the observation of horned lizard tracks and the known occurrence of the species in the immediate vicinity of the Project site. As flat-tailed horned lizard is a sensitive species, it is discussed further in Section 3.3.4 below.

### 3.2.2.3 Birds

Avian species commonly observed within or adjacent to the Project site include Abert's towhee (*Melospiza aberti*), Gambel's quail (*Callipepla gambelii gambelii*), rock dove (*Columba livia*), blue-gray gnatcatcher (*Poliophtila caerulea*), black-tailed gnatcatcher (*P. melanura*), Anna's hummingbird (*Calypte anna*), house finch (*Haemorhous mexicanus frontalis*), Say's phoebe (*Sayornis saya*), verdin (*Auriparus flaviceps acaciarum*), western meadowlark (*Sturnella neglecta*), and lesser goldfinch (*Spinus psaltria hesperophilus*). Sensitive species are discussed in Section 3.3.4 below.

### 3.2.2.4 Mammals

The following 10 mammal species were detected during the 2018 and 2019 biological surveys: desert black-tailed jackrabbit (*Lepus californicus deserticola*), desert cottontail (*Sylvilagus audubonii*), round-tailed ground squirrel (*Spermophilus tereticaudus*), Botta's pocket gopher (*Thomomys bottae*), kangaroo rat (*Dipodomys* sp.), coyote (*Canis latrans*), kit fox (*Vulpes macrotis*), northern raccoon (*Procyon lotor*), American badger (*Taxidea taxus*), and bobcat (*Lynx rufus*). As American badger is a sensitive species, it is discussed further in Section 3.3.4 below.

## 3.3 Sensitive Biological Resources

### 3.3.1 Regulatory Setting

#### 3.3.1.1 Regulatory Framework

Various federal and state regulations or policies apply to biological resources on or adjacent to the Project parcels and are summarized below.

## **a. Federal Regulations**

The federal Endangered Species Act (ESA) provides the legal framework for the listing and protection of species (and their habitats) that are identified as being endangered or threatened with extinction. Actions that jeopardize endangered or threatened species and the habitats upon which they rely are considered ‘take’ under the ESA. Section 9(a) of the ESA defines ‘take’ as “to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or attempt to engage in any such conduct.” The ESA is administered by the USFWS.

The Migratory Bird Treaty Act (MBTA; 16 United States Code 703 et seq.) is a federal statute that implements treaties with several countries on the conservation and protection of migratory birds. The number of bird species covered by the MBTA is listed at 50 Code of Federal Regulations (CFR) 10.13. The regulatory definition of “migratory bird” is broad and includes any mutation or hybrid of a listed species and any part, egg, or nest of such birds (50 CFR 10.12). The MBTA, which is enforced by USFWS, makes it unlawful “by any means or in any manner, to pursue, hunt, take, capture, [or] kill” any migratory bird, or attempt such actions, except as permitted by regulation. The take, possession, import, export, transport, sale, purchase, barter, or offering of these activities is prohibited, except under a valid permit or as permitted in the implementing regulations (50 CFR 21.11). Pursuant to U.S. Department of the Interior Memorandum M-37050, the federal MBTA is no longer interpreted to cover incidental take of migratory birds (U.S. Department of the Interior 2017). Therefore, impacts that are incidental to implementation of an otherwise lawful project would not be considered significant.

The Rivers and Harbors Act of 1899 and the Clean Water Act (CWA) regulate project activities within non-marine navigable waters and/or waters of the U.S. The discharge of any pollutant from a point source into navigable waters is illegal unless a permit under the CWA’s provisions is acquired. Permitting for projects that include both permanent and temporary dredging and filling in wetlands and waters of the U.S. is overseen by the USACE under Section 404 of the CWA. Projects can be permitted on an individual basis or be covered by one of several approved nationwide or regional general permits.

## **b. State Regulations**

The California Environmental Quality Act (CEQA) requires an environmental review for projects with potentially adverse impacts on the environment. Adverse environmental impacts are typically mitigated in accordance with state laws and regulations.

The California ESA is similar to the federal ESA in that it provides the legal framework for the listing and protection of species (and their habitats) that are identified as being endangered or threatened with extinction.

Section 3503 of the California Fish and Game Code states that it is “unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by this code or any regulation made pursuant thereto,” and Section 3503.5 states that it is “unlawful to take, possess, or destroy any birds of prey or to take, possess, or destroy the nest or eggs of any such bird” unless authorized (State of California 1991).

The California Fish and Game Code (Sections 1600 through 1603) regulates project activities within wetlands and riparian habitats. The CDFW can issue a Streambed Alteration Agreement for projects affecting riparian and wetland habitats.

Project activities that fill or dredge within wetland waters of the U.S. and waters of the U.S. as well as wetland waters of the state and waters of the state, including isolated waters such as vernal pools and other waters showing lack of connectivity to a Traditional Navigable Waters, require a Water Quality Certification by the California Regional Water Quality Control Board (RWQCB) under Section 401 of the CWA and Section 13000 et seq. of the California Water Code under the Porter-Cologne Water Quality Control Act.

### **3.3.1.2 Sensitivity Criteria**

Vegetation communities are considered sensitive natural communities if they are of limited distribution; have federal, state, or local laws regulating their development; and/or support concentrations of sensitive plant or wildlife species. For purposes of this report, the following natural communities are considered sensitive: (1) communities with state rarity ranks of S1-S3, as reviewed by the Vegetation Classification and Mapping Program (VegCAMP) and CNPS, and recognized by CDFW (2018a); and (2) wetlands and waters under the jurisdiction of federal and state agencies.

For purposes of this report, plant and wildlife species would be considered sensitive if they are: (1) listed by state or federal agencies as rare, threatened, or endangered or are proposed for listing; (2) given a California Rare Plant Rank 1B (considered endangered throughout its range), 2 (considered endangered in California but more common elsewhere), 3 (more information about the plant's distribution and rarity needed), or 4 (plants of limited distribution) in the CNPS Inventory of Rare and Endangered Vascular Plants of California (2019); (3) considered rare, endangered, or threatened by CDFW (2018b-d, 2019b); or (4) identified by another recognized conservation or scientific group as being depleted, potentially depleted, declining, rare, critical, endemic, endangered, or threatened.

### **3.3.2 Sensitive Vegetation Communities**

The following vegetation communities mapped within the Project site and surrounding 100-foot radius are considered sensitive: arrow weed thickets (state rarity rank of S3), quailbush scrub (wetland waters of the state; see Section 3.3.6), common reed marshes (wetland waters of the state; see Section 3.3.6), cattail marsh (see Section 3.3.6), and one stand of tamarisk thickets (wetland waters of the state; see Section 3.3.6).

### **3.3.3 Sensitive Plant Species**

No sensitive plant species were observed during the focused rare plant surveys or other biological surveys conducted in 2018 and 2019 for this Project, and no sensitive plant species were determined to have a moderate or high potential to occur within or adjacent to the Project site. Attachment 4 summarizes the potential occurrence of sensitive plant species

that were assessed based on species locations records, habitat suitability, and soil preferences.

### 3.3.4 Sensitive Wildlife Species

The following nine sensitive wildlife species were detected during the general and focused biological surveys conducted in 2018 and 2019 for this Project: flat-tailed horned lizard, ferruginous hawk (*Buteo regalis*), prairie falcon (*Falco mexicanus*), burrowing owl, loggerhead shrike (*Lanius ludovicianus*), black-tailed gnatcatcher, LeConte's thrasher (*Toxostoma lecontei*), Abert's towhee, and American badger (see Figure 4). Descriptions of these observed sensitive wildlife species are provided in the following sections and summarized in Attachment 5.

Based on an assessment of species location records and habitat suitability, the following five additional sensitive wildlife species were identified as having a high or moderate potential to occur within the Project site: Colorado Desert fringe-toed lizard (*Uma notata*), southwestern willow flycatcher (*Empidonax traillii extimus*), vermilion flycatcher (*Pyrocephalus rubinus*), pallid bat (*Antrozous pallidus*), and Yuma hispid cotton rat (*Sigmodon hispidus eremicus*). Descriptions of these potentially occurring sensitive wildlife species are provided in Section 3.3.4.2 below and summarized in Attachment 5. However, vermilion flycatcher is only addressed in Attachment 5, as the sensitivity status of this species only applies to nesting individuals, which are not expected to occur on site.

The following additional 13 sensitive wildlife species were detected during surveys but are only addressed in Attachment 5, as none of these species is expected to breed on or adjacent to the Project site: American white pelican (*Pelecanus erythrorhynchos*), double-crested cormorant (*Phalacrocorax auritus albociliatus*), great egret (*Ardea alba*), great blue heron (*Ardea herodias*), snowy egret (*Egretta thula thula*), black-crowned night heron (*Nycticorax nycticorax*), Cooper's hawk (*Accipiter cooperii*), northern harrier (*Circus hudsonius*), long-billed curlew (*Numenius americanus*), Vaux's swift (*Chaetura vauxi*), Brewer's sparrow (*Spizella breweri*), yellow-headed blackbird (*Xanthocephalus xanthocephalus*), and yellow warbler (*Setophaga petechia*). Each of these species' sensitivity status is only applied to nesting individuals or nesting colonies.

#### 3.3.4.1 Sensitive Wildlife Species Detected

##### a. Flat-tailed Horned Lizard (*Phrynosoma mcallii*)

Flat-tailed horned lizard is a CDFW species of special concern and BLM sensitive species. Flat-tailed horned lizard is found in the low deserts of southwestern Arizona, southeastern California, and adjacent portions of northwestern Sonora and northern Baja California, Mexico. In California, flat-tailed horned lizard is restricted to desert washes and desert flats in central Riverside, eastern San Diego, and Imperial counties. The majority of the habitat for the species is in Imperial County (CDFW 2018c; Turner et al. 1980 as cited in Flat-tailed Horned Lizard Interagency Coordinating Committee [ICC] 2003). This species is known to inhabit sand dunes, sheets, and hummocks, as well as gravelly washes. It is thought to be

most abundant in creosote bush scrub. However, this species may be found in a variety of desert scrub communities, desert wash, succulent shrub, alkali scrub, sparsely vegetated sandy flats, desert pavement, and rocky slopes. It is typically found in dry, hot areas of low elevation (less than 800 feet; ICC 2003). Flat-tailed horned lizards escape extreme temperatures by digging shallow burrows in the loose sand. Adults are primarily active from mid-February to mid-November. Breeding activity takes place in the spring with young hatching in late July and September. The diet of horned lizards typically consists of greater than 95 percent native ant species, mostly large harvester ants (including *Pogonomyrmex* spp. and *Veromessor* spp.). Human activities have resulted in the loss of approximately 49 percent of the historic habitat of flat-tailed horned lizard (ICC 2003). The decline in this species' population is primarily due to impacts from utility lines, roads, geothermal development, sand and gravel mining, off-highway vehicle recreation, waste disposal sites, military activities, pesticide use, and U.S. Border Patrol activities (ICC 2003).

Many occurrences of flat-tailed horned lizard have been reported in the undeveloped desert areas immediately west and south of the Project site (CDFW 2019a), and horned lizard tracks were observed during 2018 surveys in the western portion of the Project site, south of Westside Main Canal. Given the cryptic nature and resulting difficulty of detection without focused surveys, these historical records are sufficient to assume this species is present in the creosote bush scrub and fourwing saltbush scrub within and adjacent to the Project site. Within the Project site, these communities provide high-quality habitat for this species, with sandy hummocks having re-established in the old agricultural fields, a good diversity of native plant species, and harvester ants present. The remainder of the Project site south of Westside Main Canal provides marginally suitable habitat, and flat-tailed horned lizard has a high potential to occur due only to the adjacency of high-quality habitat. North of Westside Main Canal, this species has a low potential to occur due to the prevalence of active agriculture and solar development.

## **b. Ferruginous Hawk (*Buteo regalis*)**

Ferruginous hawk (wintering) is a CDFW watch list species (CDFW 2018c). This species is a fairly common winter visitor to southern California from mid-September to late April (Small 1994). The ferruginous hawk's winter range includes open terrain such as grassland, open shrub lands, desert edges, and agricultural lands (Bechard and Schmutz 1995; Small 1994). Its diet is predominantly rabbits and ground squirrels, which are captured by hunting from perches and by aerial hunting (Bechard and Schmutz 1995). Population declines are believed to be due to a general loss of grassland habitat as a result of urban development and overgrazing (Unitt 2004).

Ferruginous hawk was observed flying overhead during the December 2018 and January 2019 surveys. This species is likely to forage within the open vegetation of the Project site and adjacent agricultural fields during winter due to the presence of common prey items such as cottontail rabbits, jackrabbits, and ground squirrels. The eucalyptus trees within the northern Project site and utility towers within and adjacent to the Project site may provide suitable nest sites. However, the Project site is outside this species' known breeding range, and this species was not observed on site during its typical breeding season. Therefore,

ferruginous hawk is only expected to occur as a winter visitor and is not expected to nest within or adjacent to the Project site.

### **c. Prairie Falcon (*Falco mexicanus*)**

Prairie falcon (nesting) is a CDFW watch list species (CDFW 2018c). The prairie falcon is a permanent resident within the arid open lands of interior California, including the Colorado Desert (Small 1994). This species' primary foraging habitat includes open perennial and annual grasslands, savannahs, rangeland, agricultural fields, and desert scrub areas (Unitt 2004). Ground squirrels (*Spermophilus* spp.) make up the bulk of the prairie falcon's diet, but they will also prey on small birds such as horned lark (*Eremophila alpestris*) and western meadowlark, especially during the winter (Steenhof 2013). This species nests directly on cliff ledges or bluffs, without building a nest, and occasionally in rock crevices that are near suitable foraging habitat. However, they are also known to reuse old raven or eagle nests. The prairie falcon will forage as far away as 20 to 25 miles from their nesting site where the density of prey is low (Unitt 2004). Current threats to prairie falcon populations include human disturbance near nest sites and the loss of foraging habitat (Unitt 2004). Urbanization of foraging habitats within the desert badlands has resulted from agricultural encroachment, livestock-grazing, energy development activities, off-road vehicle use, and military training (Steenhof 2013).

Prairie falcon was observed flying overhead and foraging in the active agricultural fields adjacent to the northern portion of the Project site in the early July, early October, and mid-December 2018. The Project site and surrounding areas provide suitable open desert habitat and agricultural fields for foraging. The Project site and surrounding areas lack suitable cliff faces or bluffs preferred for nesting. However, the utility towers that occur within and adjacent to the west side of the Project site may provide nesting opportunities, as this species is known to reuse old raven nests. Therefore, this species is expected to occur as a winter visitor and has a low potential to nest on or adjacent to the Project site due to the presence of lattice utility towers.

### **d. Burrowing Owl (*Athene cunicularia*)**

Burrowing owl (burrow sites and some wintering sites) is a CDFW species of special concern and BLM sensitive species (CDFW 2018c). This species occurs as a year-round resident and winter visitor in Imperial County. Habitat for the burrowing owl includes dry, open, short-grass areas with level to gentle topography and well-drained soils, as well as agricultural areas (CDFW 2012; Small 1994). These areas are also often associated with burrowing mammals (Haug et al. 1993). The burrowing owl is diurnal and perches during daylight at the entrance to its burrow or on low posts. Nesting occurs from March through August. Burrowing owls form pair-bonds for more than one year and exhibit high site fidelity, reusing the same burrow year after year (Haug et al. 1993). The female remains inside the burrow and is fed by the male during most of the egg laying and incubation period. Burrowing owls are opportunistic feeders, consuming a diet that includes arthropods, small mammals, and birds, and occasionally amphibians and reptiles (Haug et al. 1993). Urbanization has greatly reduced the amount of suitable habitat for this species (Lincer and Bloom 2007). Other

contributions to the decline of this species include the poisoning of squirrels and prairie dogs, road and ditch maintenance, and collisions with automobiles (CDFW 2012).

As described in the burrowing owl survey reports (RECON 2018, 2019a), no burrowing owls were observed on the Project site during the 2018 breeding season surveys, but four burrowing owl observations were recorded within the Project site during the 2018-2019 non-breeding season surveys (see Figure 4). These observations indicate that at least two, but likely three, individuals, appear to use the Project site and surrounding areas as a wintering site or for migration and dispersal, but is not currently using the site as breeding habitat. The creosote bush scrub, fourwing saltbush scrub, upland mustards, fallow agriculture, and disturbed habitat within and adjacent to the Project site provide suitable habitat for this species for breeding and wintering due to the open structure of the vegetation, presence of prey items, and abundance of potentially suitable burrows. As the more dense stands of arrow weed thickets and tamarisk thickets occur as small or linear patches within larger expanses of open vegetation, these typically unsuitable communities may also contribute suitable perch sites.

#### **e. Loggerhead Shrike (*Lanius ludovicianus*)**

Loggerhead shrike (nesting) is a CDFW species of special concern (CDFW 2018c). This species inhabits most of the continental United States and Mexico and is an uncommon year-round resident of southern California. It prefers washes with scattered trees or shrubs, or valley floors with scattered thickets of mesquite (*Prosopis* spp.) or saltbush (*Atriplex* spp.). Outside the desert this species inhabits grasslands, agricultural fields, open sage scrub, and chaparral (Unitt 2004). The loggerhead shrike requires open habitat with tall shrubs or trees to use as perches for hunting and fairly dense shrubs for nesting. It may also use fences or power lines for hunting perches (Shuford and Gardali 2008; Yosef 1996). Loggerhead shrikes are highly territorial and usually live in pairs in permanent territories (Yosef 1996). This species feeds on small reptiles, mammals, smaller birds, amphibians, and insects that they often impale on sticks or thorns before eating (CDFW 2014a). This bird may also be associated with freshly plowed or mowed fields, as these activities create foraging opportunities for this species (Yosef 1996). Loggerhead shrike populations are declining, likely due to urbanization and loss of habitat and, to a lesser degree, pesticide use (Yosef 1996). This species has also shown a decline in undeveloped areas, which suggests that it is susceptible to habitat fragmentation (Unitt 2004). Non-native grasses and forbs introduced by livestock grazing pose the greatest threat to shrikes in sagebrush–steppe habitats (Shuford and Gardali 2008).

Loggerhead shrike was observed in tamarisk thickets on the Project site and in common reed marsh and creosote bush scrub immediately adjacent to the Project site on multiple survey visits: May 30, July 6, October 4, November 8, and December 16 and 17, 2018, and January 24, 2019. With the combination of dense patches of shrubs or trees and adjacent open areas, the Project site and surrounding areas provide suitable breeding and foraging habitat for this species. Therefore, this species is likely a resident and has a high potential to nest within the Project site.

**f. Black-tailed Gnatcatcher (*Polioptila melanura*)**

Black-tailed gnatcatcher is a CDFW watch list species (CDFW 2018c). This species is a fairly common resident in the lower Colorado River Valley (Small 1994). It is found in desert scrub, with a preference for well-vegetated desert washes, desert oases, and willow thickets along watercourses, but able to live far away from water sources (Unitt 2004; Small 1994). This species primarily eats insects, ranging from insect eggs and caterpillars to grasshoppers, and occasionally takes in fruit or seeds (Farquhar et al. 2002). Black-tailed gnatcatchers often pair bond for life and defend permanent territories. Breeding generally occurs from March to June, although timing is heavily dependent on weather conditions and abundance of food (Unitt 2004). A pair will build their nest in dense shrubs to provide protection from direct sun and show a preference for spiny shrubs or trees (Unitt 2004; Small 1994). This species has a low tolerance for disturbance, typically avoiding urban areas and areas with non-native vegetation; is susceptible to brown-headed cowbird (*Molothrus ater*) nest parasitism; and is threatened by habitat loss due to over-pumping of groundwater (Unitt 2004; Small 1994).

Black-tailed gnatcatcher was detected during nearly every survey visit conducted in 2018 and 2019 and was typically observed in the creosote bush scrub and arrow weed thickets along the boundaries of the Project site south of Westside Main Canal, but occasionally in the western portion of the survey buffer north of Westside Main Canal. The arrow weed thickets, fourwing saltbush scrub, tamarisk thickets, and creosote bush scrub within and adjacent to the Project site provide suitable breeding and foraging habitat for this species. Based on the frequency of detection this species was not mapped. Based on this frequency and presence of suitable habitat, this species has a high potential to nest within or adjacent to the Project site.

**g. LeConte's Thrasher (*Toxostoma lecontei*)**

LeConte's thrasher is a CDFW species of special concern (CDFW 2018c). It is a permanent, but uncommon, resident in the San Joaquin Valley, Mojave and Colorado Deserts of California, the Sonoran Desert in Arizona, as well as Utah, Nevada, and Baja California, Mexico (Sheppard 1996). This sensitive bird requires undisturbed substrate for foraging under desert shrubs (Sheppard 1996). Ideal habitat throughout this species' range consists of sparsely vegetated desert flats, dunes, sandy alluvial fans below desert mountains, alkaline dry lakes, or gently rolling hills (Sheppard 1970). Dominant shrub species are saltbush (*Atriplex* spp.) not exceeding eight feet high and cholla (*Opuntia* spp.) ranging three to six feet high (Sheppard 1996). Creosote (*Larrea* sp.) may also be present, but the thrasher does not typically utilize this shrub species for shelter or nesting (Sheppard 1970, 1996). This bird also uses vegetated margins of large, rolling sand dunes, i.e., Algodones Dunes in Imperial County, California, and Scammon Lagoon, Baja California (Sheppard 1996). LeConte's thrasher feeds almost completely on arthropods and digs into the ground two to three inches with its bill. This insectivorous diet provides the only source of water for the thrasher. Generally, this species can be found mostly on the ground, running from shrub to shrub with its tail held high (Sheppard 1970). Destruction of substrate and shrubs, and extensive and repeated off-road use in the deserts are the primary threats to this species. Habitat conversion to agriculture is another major factor in reducing the amount of habitat available to this species and in isolating currently occupied area (Laudenslayer et al. 1992 as

cited in Shuford and Gardali 2008). This species also suffers from shootings and livestock grazing, which denudes and decimates the vegetation (Sheppard 1996).

LeConte's thrasher was observed during the November and December 2018 survey visits in arrow weed thickets and fourwing saltbush scrub on the Project site. Although this species is likely resident in the native desert scrub communities within and adjacent to the Project site, it is unlikely to nest on the Project site due to the lack of cactus and low number of thorny shrubs.

#### **h. Abert's Towhee (*Melospiza aberti*)**

Abert's towhee lacks a state or federal listing or sensitivity status but is tracked by CDFW (i.e., is included in the Special Animal List), as it meets one or more of CDFW's conditions to be considered a species at risk (CDFW 2018c). This is a characteristic, resident, and territorial species of the Sonoran and Colorado deserts (Small 1994). Abert's towhee utilizes a variety of desert scrub communities but is often associated with streamside cottonwood-willow riparian forest and mesquite woodlands. However, this species has also shown an ability to acclimate to mixed native and non-native vegetation, as long as a sufficiently dense understory is present for nest placement (Tweit and Finch 1994). Abert's towhee primarily feeds on insects on the ground and occasionally consumes seeds. Habitat conversion to agriculture and urbanization has reduced the amount of habitat available to this species (Small 1994).

Abert's towhee was observed as a common species during the 2018 and 2019 surveys in the arrow weed thickets, fourwing saltbush scrub, and creosote bush scrub within and adjacent to the Project site. Based on the frequency of detection this species was not mapped. This species has a high potential to nest in the dense patches or stands of the communities listed above.

#### **i. American Badger (*Taxidea taxus*)**

American badger is a CDFW species of special concern (CDFW 2018c). American badgers are widespread, ranging from the Great Lakes to the Pacific Coast, and from the Canadian Prairie provinces to the Mexican Plateau. This species can be found in a variety of habitats, which include shrub steppes, agricultural fields, open woodland forests, and large grass and sagebrush meadows and valleys (Streubel 2000). Its breeding season occurs from mid- to late summer, after which egg implantation is delayed until December to February. A litter of two to five young are born between March and early April (Streubel 2000). American badger's diet consists of a variety of rodents, scorpions, insects, snakes, lizards, birds, and carrion. Declines in American badger populations and distribution have resulted from habitat fragmentation from urbanization and development of roads (Tremor et al. 2017).

One American badger was observed immediately south of the Project site on July 6, 2019. American badger tracks were observed in the southwestern corner and western edge of the Project site, south of Westside Main Canal, during the same visit (see Figure 4). At least one burrow, just outside the southwestern corner of the Project site was of appropriate size to support this species. Although this species may avoid the more open upland mustard areas

in the old agricultural fields, the Project site and surrounding areas south of Westside Main Canal provide suitable habitat for this species. South of Westside Main Canal, the Project site provides suitable open scrub vegetation, potential prey (e.g., ground squirrels, pocket gophers, lizards), and numerous existing burrows and soils capable of supporting new burrows. As individuals of this species maintain large home ranges, this species would require more land than is present on-site and potentially only forages on-site. However, the presence of existing burrows does indicate the potential for the site to support breeding individuals.

### **3.3.4.2 Sensitive Wildlife Species with Moderate to High Potential to Occur**

#### **a. Colorado Desert Fringe-toed Lizard (*Uma notata*)**

Colorado Desert fringe-toed lizard is a CDFW species of special concern and a BLM sensitive species (CDFW 2018c). This species occurs from below sea level to 590 feet above sea level from the Salton Sea east into southwestern Arizona, and south into Baja California and Sonora, Mexico (Jennings and Hayes 1994; CDFW 2014b). It is primarily insectivorous, eating mostly ants, beetles, antlion larvae, hemipterans, grasshoppers, and caterpillars, but will also eat flowers, leaves, and seeds (CDFW 2014b). Fringe-toed lizards usually seek refuge from enemies by burrowing in the sand 5 to 6 centimeters (2 to 2.4 inches) deep. They also use rodent burrows and the bases of shrubs for cover and thermoregulation. Lizards usually hibernate in sand 30 centimeters (12 inches) deep, but juveniles and subadults may be found closer to the surface (CDFW 2014b).

This species has been reported within two miles of the Project site (CDFW 2019a) and has a moderate potential to occur within the Project site south of Westside Main Canal. The creosote bush scrub and fourwing saltbush scrub adjacent to and in the western and southwestern portions of the Project site, south of Westside Main Canal, provide suitable habitat for this species due to the presence of small dunes and sandy hummocks.

#### **b. Southwestern Willow Flycatcher (*Empidonax trailii extimus*)**

The southwestern willow flycatcher is federally and state listed as endangered. This migratory bird breeds in southern California, southern Nevada, southern Utah, Arizona, New Mexico, western Texas, southwestern Colorado, and extreme northwestern Mexico (USFWS 2011).

The southwestern willow flycatcher's breeding season is from late mid-May to mid-July. For breeding and nesting activities this species requires mature, multi-tiered riparian woodland habitat with a high percentage of canopy cover where surface water is present or soil moisture is high enough to support suitable tree species (Sogge et al. 2010). Nests are typically placed in trees where plant growth is most dense, where trees and shrubs have vegetation near ground level, and where there is a low-density native canopy. Although there are exceptions, generally flycatchers are found nesting in areas with willows, tamarisk, or both (USFWS 2011).

Southwestern willow flycatchers are extremely sensitive to human activity in riparian areas. Threats to this species include loss of riparian habitat due to urbanization, flood control, water diversion, grazing, and invasion of non-native species (Unitt 2004). Parasitism by brown-headed cowbirds (*Molothrus ater*) has been a significant factor in the decline of this species in California and Arizona and elsewhere (Sedgwick 2000). It should be noted that low cowbird parasitism rates, multi-tiered riparian woodland, and surface water are all important factors for the recovery of this species to be successful (Unitt 2004).

The arrow weed and tamarisk thickets within and adjacent to the Project site are suitable as foraging habitat, so the site has moderate potential to support foraging flycatchers during migration. However, the Project site and surrounding areas lack suitable mature riparian habitat for breeding, thus this species is not expected to breed on-site.

### **c. Pallid Bat (*Antrozous pallidus*)**

Pallid bat is a CDFW species of concern and BLM sensitive species (CDFW 2018c). It is a locally common yearlong resident throughout most of California, except for high elevations in the Sierra Nevada. This bat occupies a variety of habitats including grasslands, shrublands, woodlands, and mixed conifer forests, and roosts in caves, crevices, or mines, which must be sufficiently large to provide refuge from high daytime temperatures (CDFW 2014c). Pallid bats may also roost in tree hollows and bark, and sometimes rodent burrows or dried mud (Tremor et al. 2017). This species feeds on large prey items such as beetles, grasshoppers, cicadas, spiders, scorpions, and Jerusalem crickets, as well as occasional small rodents and lizards, which it captures on the ground or on vegetation (Bat Conservation International 2011, Tremor et al. 2017). Pallid bats are very sensitive to disturbance of the roosting sites, as these roosts are crucial for metabolic economy and juvenile development. Population declines are generally attributable to loss of roost sites resulting from human intrusion and physical alteration (CDFW 2014c).

Pallid bat has a moderate potential to forage within the Project site, as the creosote bush scrub, fourwing saltbush scrub, and active agricultural fields within and adjacent to the Project site provide suitable foraging habitat. The tall eucalyptus, tamarisk, and palm trees within and adjacent to the Project site may be only marginally suitable as roost sites. However, the patchy nature of the mature trees that occur on and adjacent to the Project site likely makes these trees less suitable as roost sites. Therefore, pallid bat has a low potential to roost on-site.

### **d. Yuma Hispid Cotton Rat (*Sigmodon hispidus eremicus*)**

Yuma hispid cotton rat is a CDFW species of special concern (CDFW 2018c). Yuma hispid cotton rat occurs along the Colorado River and its range extends into agricultural areas of Imperial Valley as a result of irrigation infrastructure. This species occupies moist grassland, croplands, grass- or forb-dominated communities or understories, and brushy areas along the borders of fields. It has also been reported from areas dominated by marsh plants, such as cattails, arrowweed, and common reed. Its diet consists primarily of grasses, taking occasional insects and crops. Yuma hispid cotton rats are solitary, nocturnal and diurnal, active year-round, and build nests of woven grass in burrows or on the ground (CDFW 2014d).

This species has been reported along the Westside Main Canal within two miles of the Project site (CDFW 2019a) and has a moderate potential to occur within and adjacent to the Project site. The combination of wetland communities along Westside Main Canal, dense herbaceous cover within the fallow agriculture areas, and active agriculture within and adjacent to the Project site may provide suitable habitat conditions for this species. This species would likely avoid the open areas of upland mustards and the drier scrub habitats in the majority of the Project site, south of Westside Main Canal, as they tend to prefer tall, dense grasses located closer to water sources.

### 3.3.5 Wildlife Movement Corridors

Wildlife movement corridors are defined as areas that connect suitable wildlife habitat areas in a region otherwise fragmented by rugged terrain, changes in vegetation, or human disturbance. The Project site lies adjacent to a large expanse of undeveloped desert in the Imperial Valley, which provides unconstrained habitat connectivity between the Salton Sea and the Gulf of California. While the site functions as part of general habitat that provides for local movement of terrestrial wildlife, it does not serve as a corridor.

### 3.3.6 Jurisdictional Wetlands and Waters

As discussed in the jurisdictional waters/wetland delineation report (RECON 2019b), jurisdictional wetlands and waters within the Project site and surrounding 100-foot radius are mostly associated with Westside Main Canal and other agriculture-related irrigation infrastructure.

As shown in Table 3 below and on Figure 5, a total of 9.63 acres of jurisdictional waters were delineated within the Project site and 11.52 acres were delineated in the surrounding 100-foot radius. This comprises the Westside Main Canal, an east-west concrete-lined irrigation channel, and a north-south concrete-lined irrigation channel.

Table 3 Existing Jurisdictional Waters within the Project Site and Surrounding 100-foot Radius (acres)		
Jurisdictional Waters	Project	100-foot Buffer
<b>USACE Total Jurisdictional Waters (404)</b>	<b>0.21</b>	<b>5.76</b>
Non-wetland Waters of the U.S.	0.21	5.76
<b>CDFW and RWQCB Total Jurisdictional Waters (1602/401)<sup>1</sup></b>	<b>9.43</b>	<b>11.52</b>
Wetland Waters of the State	9.22	5.76
Streambed	0.21	5.76
<sup>1</sup> CDFW/RWQCB area of jurisdiction includes all USACE jurisdictional waters.		

-  Project Boundary
-  Survey Area
-  Sample Points
- Jurisdictional Waters**
-  CDFW/RWQCB Wetland Waters of the State
-  USACE Non-wetland Waters of the U.S., CDFW Streambed, RWQCB Waters of the State

**FIGURE 5**  
Existing Jurisdictional Waters

A total of 0.21 acre of USACE jurisdictional non-wetland waters of the U.S. was delineated within the Project site, with an additional 5.76 acres delineated within the surrounding 100-foot buffer. No USACE jurisdictional wetlands were delineated. Although it is possible that the area of cattail marshes within the Project site would have met all three wetland parameters, this wetland habitat was removed prior to the jurisdictional delineation and, therefore, was not delineated as a wetland for this report.

As shown in Table 3 and on Figure 5, a total of 9.43 acres of wetland waters of the state under the jurisdiction of CDFW and RWQCB were delineated within the Project site and 11.52 acres were delineated within the surrounding 100-foot radius. This includes all portions of the common reed marshes along the Westside Main Canal and the patches of quailbush scrub, arrow weed thickets, and tamarisk thickets in the northern portion of the Project (see Figure 4). These patches of hydrophytic vegetation primarily occur within 25 feet of an actively used, concrete-lined irrigation channel and/or the Westside Main Canal and appear to be associated with these channels as riparian habitat. Although the quailbush scrub in the northwestern portion of the survey area and the arrow weed thickets in the eastern portion of the survey area continue north and south, respectively, for many hundreds of feet from the waterways, their persistence is likely due to lateral water seepage. Therefore, these stands of vegetation would likely be considered an extension of these CDFW and RWQCB jurisdictional wetland habitats.

The tamarisk thickets in the eastern and southern portions of the Project site and surrounding 100-foot radius occur along ditches associated with the abandoned agriculture fields. These habitats are likely a relic of when these ditches regularly conveyed irrigation water and do not appear to be associated with the active water channels and canal in the northern portion of the survey area. Therefore, these stands are not considered wetlands under the jurisdiction of CDFW or RWQCB.

## 4.0 Project Impact Analysis

The Project would result in direct impacts to 163.3 acres within the Project site, comprising both permanent and temporary impacts. The following sections analyze the direct, indirect, and cumulative impacts to sensitive biological resources that may result from this Project. Table 4 provides the breakdown of permanent and temporary impacts within the Project site.

<b>Table 4</b> <b>Project Impacts to Vegetation Communities/Land Cover Types</b> <b>(acres)</b>			
Community or Type	Permanent Impacts	Temporary Impacts	Total Impacts
upland mustard	73.45	1.24	74.70
fourwing saltbush scrub	47.72	0.01	47.74
fallow agriculture	4.02	9.54	13.56
<b>arrow weed thickets</b>	<b>6.02</b>	<b>0.85</b>	<b>6.87</b>
creosote bush scrub	6.24	0.19	6.43
disturbed habitat	1.81	3.96	5.77
<b>tamarisk thickets</b>	<b>4.73</b>	<b>0.53</b>	<b>5.26</b>
<b>quailbush scrub</b>	<b>0.34</b>	<b>1.81</b>	<b>2.15</b>
eucalyptus groves	0.04	0.54	0.58
<b>cattail marshes</b>	<b>0.00</b>	<b>0.14</b>	<b>0.14</b>
<b>open water</b>	<b>0.00</b>	<b>0.10</b>	<b>0.10</b>
<b>common reed marshes</b>	<b>0.04</b>	<b>0.00</b>	<b>0.04</b>
developed land	0.00	0.00	0.00
<b>Total</b>	<b>144.51*</b>	<b>18.81*</b>	<b>163.32*</b>
*Total acreage varies from sum of cells due to rounding.			
<b>Bold</b> entries denote sensitive communities/land cover types (see Sections 4.1 and 4.5)			

In accordance with Appendix G of the CEQA Guidelines, the Project would have a significant impact if it would:

- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations or by the CDFW or USFWS;
- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies or regulations, or by the CDFW or USFWS;
- Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;
- Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;
- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance; and/or
- Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

## 4.1 Impacts to Sensitive Vegetation Communities

The Project would result in impacts to 14.46 acres of sensitive vegetation communities (Table 5), comprising 11.13 acres of permanent and 3.33 acres of temporary impacts. Table 5 provides the breakdown of impacts to each sensitive vegetation community and Figure 6 illustrates the extent of impacts on-site.

<b>Table 5</b> <b>Project Impacts to Sensitive Vegetation Communities</b> <b>(acres)</b>			
Community or Type	Permanent Impacts	Temporary Impacts	Total Impacts
arrow weed thickets	6.02	0.85	6.87
tamarisk thickets	4.73	0.53	5.26
quailbush scrub	0.34	1.81	2.15
cattail marshes	0.00	0.14	0.14
common reed marshes	0.04	0.00	0.04
<b>Total</b>	<b>11.13</b>	<b>3.33</b>	<b>14.46</b>

Impacts to these sensitive communities would be considered significant and require mitigation. Impacts to the other vegetation communities and land cover types would not be considered significant and would not require mitigation.

## 4.2 Impacts to Sensitive Plant Species

The Project is not expected to impact any sensitive plant species as no sensitive plant species were observed during surveys conducted in 2018 and 2019, and no sensitive plant species were determined to have a moderate or high potential to occur.

## 4.3 Impacts to Sensitive Wildlife Species

The Project has potential to impact to 14 sensitive wildlife species that occur or have a moderate to high potential to occur within the Project impact area. Direct impacts would result from incidental mortality and habitat removal within the Project construction footprint. The Project impact area in relation to the observed sensitive wildlife species locations is shown on Figure 6.

### 4.3.1 Reptiles

Two sensitive reptiles were identified as having potential to occur on-site: flat-tailed horned lizard and Colorado Desert fringe-toed lizard. Both of these species are CDFW Species of Special Concern and BLM Sensitive Species.

**FIGURE 6**  
Impacts to Biological Resources

The Project has the potential to directly impact approximately 54 acres of suitable and assumed-occupied habitat for the flat-tailed horned lizard through habitat loss. Direct impacts to individual lizards, if present on-site, would be considered significant and require mitigation.

The Project has the potential to directly impact approximately 56 acres of suitable habitat for the Colorado Desert fringe-toed lizard through habitat loss. Direct impacts to individual lizards, if present on-site, would be considered significant and require mitigation.

Ongoing O&M could result in impacts through the introduction of trash and litter, attracting greater numbers of predators, such as ravens, which could in turn prey upon sensitive lizard species. There is a potential for impacts from vehicular traffic on-site post-construction. These would be considered significant and require mitigation.

### 4.3.2 Birds

Seven sensitive bird species were identified as having potential to occur on-site: ferruginous hawk, prairie falcon, burrowing owl, southwestern willow flycatcher, loggerhead shrike, black-tailed gnatcatcher, LeConte's thrasher, and Abert's towhee.

There is a potential for direct impacts to the burrowing owl from construction. Currently, the impacts would only be to wintering individuals; however, suitable breeding habitat is present and impacts to breeding individuals could occur if the species begins to use the site during the breeding season. Approximately 155 acres of suitable habitat are present within the Project site and would be subject to impact. Impacts to wintering and breeding individuals and their habitat would be considered significant and require mitigation.

Given that there is no suitable nesting habitat for the southwestern willow flycatcher on-site, there would be no impacts expected to occur to this species either from construction or ongoing O&M.

Direct impacts to the ferruginous hawk, prairie falcon, loggerhead shrike, LeConte's thrasher, Abert's towhee, and black-tailed gnatcatcher from construction activities would be considered less than significant for the following reasons: the site is surrounded by the larger BLM desert to the south and west that provides foraging habitat for all of these species and nesting habitat for the gnatcatcher, shrike, thrasher, and towhee; the population of any of these species on-site would not represent a substantial component of the region's population and impacts to individuals would not preclude the ability for the species to be self-sustaining. No mitigation beyond what would be required for nesting birds would be required.

Nesting birds including raptors covered under the California Fish and Game Code 3503 and 3503.5 have potential to be directly impacted by the Project if construction activities (i.e., clearing, grubbing, grading) occur during the general nesting season of February 1 to September 15. Direct impacts to nesting birds and raptors would be considered significant and require avoidance measures.

Ongoing O&M is not expected to significantly impact any of these species as the site would be maintained in the converted state and not expected to attract the species post-construction. In addition, the level of night lighting should be minimal and directed down and to the interior of the site and noise generated should be minimal, so as to minimize any indirect impacts to the species on adjacent habitat.

Ongoing O&M could result in impacts through the introduction of trash and litter, attracting greater numbers of predators, such as ravens and large mammals, which could in turn prey upon sensitive bird species. These would be considered significant and require mitigation.

### 4.3.3 Mammals

Three sensitive mammals were either observed or identified as having moderate to high potential to occur on-site: American badger, pallid bat, and Yuma hispid cotton rat.

Direct impacts to American badger during construction, if active dens are found on-site, may be considered significant and require mitigation.

Direct impacts to the pallid bat during construction would result from loss of suitable foraging habitat. These impacts would be considered less than significant for the following reasons: this species is mobile and foraging individuals are expected to avoid and move out of harm's way; given the lack of highly suitable roosting habitat, the population of this species on-site, if present, would not represent a substantial component of the region's population and impacts to individuals would not preclude the ability for the species to be self-sustaining.

The potential for direct impacts to the Yuma hispid cotton rat, if present, is considered to be low based on the following reasons: the Westside Main Canal and associated common reed marsh along the edge would not be impacted beyond a small bridge span to connect the northern and southern parts of the Project; the grassy, fallow parcel along the north would only be temporarily impacted, rather than fully converted; this northern fallow parcel is adjacent to active agriculture, which provides more highly suitable habitat for the species; and the population of this species on-site, if present, would not likely represent a substantial component of the region's population and impacts to individuals would not preclude the ability for the species to be self-sustaining. Based on these reasons, direct impacts, if the species were to be present, would be considered adverse but less than significant.

Ongoing O&M is not expected to significantly impact any of these mammal species. Suitable habitat for the American badgers would not be present post-development. The Westside Main Canal would remain in essentially the same as the pre-construction state and thus O&M activities would not affect the Yuma hispid cotton rat or pallid bat. In addition, the level of night lighting should be minimal and directed down and to the interior of the site and noise generated should be minimal, so as to minimize any indirect impacts to the species on adjacent habitat.

## 4.4 Impacts to Wildlife Corridors

No significant direct or indirect impacts to wildlife movement are expected to occur from implementation of the Project, as the Project parcels do not function as a true wildlife movement corridor.

## 4.5 Impacts to Jurisdictional Wetlands and Waters

As shown in Table 6 and on Figure 7, the Project would impact all delineated jurisdictional waters on-site. A total of 6.75 acres would be permanently impacted and 2.68 acres would be temporarily impacted. This comprises 9.22 acres of CDFW/RWQCB wetland waters of the state and 0.21 acre of USACE jurisdictional non-wetland water and CDFW streambed/RWQCB waters of the state. Approximately 0.10 acre of open water within the Westside Main Canal would be spanned with a bridge. This is illustrated on Figure 7 as a permanent impact because it is a hardscaped component of the Project; however, given the fact that there would be no direct impact to the canal, this has been calculated as a temporary impact. The impacts to the vegetation along the banks of the canal associated with construction of the bridge are shown as permanent impacts in the event the construction of the footings could require clearing of the vegetation. The total extent of impacts would be refined once final designs are completed.

Table 6 Impacts to Jurisdictional Waters within the Project Site (acres)			
Jurisdictional Waters	Permanent Impacts	Temporary Impacts	Total Impacts
<b>USACE Total Jurisdictional Waters (404)</b>			
Non-wetland Waters of the U.S.	0.04	0.16 <sup>1</sup>	0.21 <sup>2</sup>
<b>CDFW and RWQCB Total Jurisdictional Waters (1602/401)<sup>3</sup></b>	<b>6.75</b>	<b>2.68<sup>2</sup></b>	<b>9.43<sup>2</sup></b>
Wetland Waters of the State	6.71	2.51	9.22
Streambed	0.04	0.16 <sup>1</sup>	0.21 <sup>2</sup>
<sup>1</sup> Approximately 0.10 acre of open water within the Westside Main Canal would be spanned with a bridge. This is illustrated as a permanent impact, but given the fact that there would be no direct impact to the canal, this is included within the temporary impacts.			
<sup>2</sup> Total acreage varies from sum of cells due to rounding.			
<sup>3</sup> CDFW/RWQCB area of jurisdiction includes all USACE jurisdictional waters.			

These impacts would be significant and would require mitigation. In addition, a USACE 404 Clean Water Permit, CDFW Streambed Alteration Agreement, and RWQCB 401 Water Quality Certification would be required.

Impacts to Jurisdictional Waters

## 4.6 Cumulative Impacts

The proposed Project is not expected to result in cumulative impacts to sensitive resource within the region because all potential impacts would be mitigated to a level of less than significant.

## 5.0 Mitigation and Monitoring Recommendations

### 5.1 Mitigation and Monitoring Recommendations for General Biological Resources

As currently designed, the Project has the potential to result in significant direct and indirect impacts to sensitive biological resources. The following general mitigation for biological resource protection during construction would be included in the environmental document:

#### BIO-1. General Measures Prior to Construction

1. The owner/permittee would engage a qualified biological monitor to implement the Project's biological monitoring program.
2. The following measures should be implemented in order to reduce potential impacts to bird and bat populations. These measures incorporate the Avian Power Line Interaction Committee design guidelines for overhead utilities by incorporating recommended or other methods that enhance the visibility of the lines to avian species. These would include, at a minimum, the following measures:
  - Minimize noise and nighttime outdoor lighting.
  - Establish and implement measures for storage and disposal of all litter and trash produced during construction and O&M. This is designed to discourage scavengers, such as ravens that may also prey on wildlife in the vicinity.
  - To avoid direct impacts to avian species, removal of habitat that supports active nests in the proposed area of disturbance should occur outside the breeding season for these species (February 1 to September 15).
  - If removal of habitat in the proposed area of disturbance must occur during the breeding season, the qualified biological monitor would conduct a pre-construction survey to determine the presence or absence of nesting birds on the proposed area of disturbance. The pre-construction survey would be conducted within 10 calendar days prior to the start of construction activities (including removal of vegetation). The applicant would submit the results of the pre-construction survey for review and approval prior to initiating any construction activities.

- If nesting birds are detected, a letter report or mitigation plan in conformance with applicable state and federal law (i.e., appropriate follow up surveys, monitoring schedules, construction and noise barriers/buffers, etc.) would be prepared and include proposed measures to be implemented to ensure that take of birds or eggs or disturbance of breeding activities is avoided. The report or mitigation plan would be submitted for review and approval.
3. The qualified biological monitor would attend the pre-construction meeting, discuss the Project's biological monitoring program, and arrange to perform any follow up mitigation measures and reporting including site-specific monitoring, restoration or revegetation, and additional fauna/flora surveys/salvage.
  4. A Worker Education Training Program should be established by the qualified biological monitor for all employees and any subcontractors to provide instruction on sensitive species identification; measures to avoid contact, disturbance, and injury; and reporting procedures in the case of dead and/or injured wildlife species.
  5. Prior to commencement of construction activities, the qualified biological monitor would meet with the owner/permittee or designee and the construction crew and implement the Worker Education Training Program. This would be repeated as necessary, when new crew members begin work on the Project.
  6. Prior to construction activities, the qualified biological monitor would supervise the placement of orange construction fencing or equivalent along the limits of disturbance adjacent to sensitive biological habitats and verify compliance with any other Project conditions. Appropriate steps/care should be taken to minimize attraction of nest predators to the site.

## **BIO-2. General Measures During Construction**

1. Speed limits along all access roads and within the Project site should not exceed 15 miles per hour. This is designed to prevent flat-tailed horned lizard mortality.
2. All construction (including access/staging areas) would be restricted to areas previously identified, proposed for development/staging, or previously disturbed. The qualified biological monitor would monitor construction activities as needed to ensure that construction activities do not encroach into biologically sensitive areas, or cause other similar damage, and that the work plan has been amended to accommodate any sensitive species located during the pre-construction surveys.
3. The qualified biological monitor would note/act to prevent any new disturbances to habitat, flora, and/or fauna onsite (e.g., flag plant specimens for avoidance during access). If active nests or other previously unknown sensitive resources are detected, all Project activities that directly impact the resource would be delayed until species specific local, state or federal regulations have been determined and applied by the Qualified Biologist.

**BIO-3. General Measures Post-Construction**

1. A Monitoring Report would be submitted to the relevant resource agencies documenting the implementation of the general measures during construction as well as any resource-specific measures such as habitat restoration, compensation, and species-specific avoidance and minimization measures.

**BIO-4. General Measures During O&M**

1. Speed limits along all access roads and within the Project site should not exceed 15 miles per hour. Access for O&M activities would be kept to the minimum necessary for operations. This limited access is designed to prevent flat-tailed horned lizard mortality.
2. A worker education program should be presented to all employees conducting O&M to inform staff of resource protection measures in place. This should be presented to any new employees.

## **5.2 Mitigation and Monitoring Recommendations for Sensitive Vegetation Communities**

The following measures are proposed to fulfill habitat-based mitigation requirements for impacts to sensitive vegetation communities:

**BIO-5. Habitat-based Mitigation**

1. Mitigation for permanent and temporary impacts to sensitive vegetation communities and land cover types is provided in Table 7. Mitigation for permanent impacts could potentially be conducted on-site through restoration of the fallow agriculture and disturbed lands that occur within the temporary impact footprint. If those lands are not suitable, off-site mitigation may be required. Temporary impacts would be mitigated on site through replacement or enhancement of the impacted area.
2. A Habitat Restoration and Mitigation Plan would be prepared to detail the proposed mitigation program. This plan should also include mitigation required for jurisdictional waters as noted in Section 5.4.

<b>Table 7</b>						
<b>Project Impacts to Sensitive Vegetation Communities/Land Cover Types</b>						
Community or Type	Permanent			Temporary		
	Impacts (acres)	Mitigation Ratio	Mitigation (acres)	Impacts (acres)	Mitigation Ratio	Mitigation (acres)*
arrow weed thickets	6.02	2:1	12.04	0.85	1:1	0.85
tamarisk thickets	4.73	2:1	9.46	0.53	1:1	0.53
quailbush scrub	0.34	2:1	0.68	1.81	1:1	1.81
cattail marshes	0	--	--	0.14	1:1	0.14
common reed marshes	0.04	2:1	0.08	--	--	--
<b>Total</b>	<b>11.13</b>		<b>22.26</b>	<b>3.33</b>		<b>3.33</b>
*Temporary impacts would be mitigated on site through replacement or enhancement of the impacted area.						

Implementation of the mitigation and monitoring measures listed above would reduce impacts to sensitive vegetation communities to a level of less than significant.

## 5.3 Mitigation and Monitoring Recommendations for Sensitive Wildlife Species

Additional species-specific recommended measures to avoid, minimize, and/or mitigate significant Project impacts to sensitive wildlife species are provided in this section.

### 5.3.1 Mitigation and Monitoring Recommendations for Flat-tailed Horned Lizard

The following measures are recommended to mitigate for direct and indirect impacts to flat-tailed horned lizard and its habitat. Implementation of mitigation measure BIO-4, including enforcement of speed limits and implementing the worker education program, would minimize impacts during O&M activities.

#### BIO-6. Flat-tailed horned lizard Measures Prior to Construction

In accordance with the Flat-tailed Horned Lizard Rangewide Management Strategy (ICC 2003), the measures proposed below are designed to avoid, minimize, and/or compensate for potential direct and indirect effects construction may have on flat-tailed horned lizard. The following Construction Measures would be implemented, when conducting construction activities within the creosote bush scrub and fourwing saltbush scrub vegetation:

1. Prior to ground-disturbing activities, an individual would be designated and approved by the wildlife regulatory agencies (e.g., CDFW, BLM) as a qualified biological monitor (i.e., field contact representative). Only persons authorized by CDFW (in California) shall conduct surveys and handle flat-tailed horned lizards. Investigators shall have experience in surveying for flat-tailed horned lizards, including ability to recognize and follow flat-tailed horned lizard tracks, or shall obtain training from an experienced investigator. Prior to any survey or monitoring effort, a proposal shall be

developed and approved by CDFW (in California), and/or by the state or federal agency that manages the lands to be surveyed. The qualified biological monitor would be designated for the period during which on-going construction and post-construction monitoring and reporting by an approved biologist is required, such as annual reporting on habitat restoration. Each successive qualified biological monitor would be approved by the wildlife regulatory agencies. The qualified biological monitor would have the authority to ensure compliance with the conservation measures for the flat-tailed horned lizard and would be the primary agency contact for the implementation of these measures. The qualified biological monitor would have the authority and responsibility to halt activities that are in violation of the conservation measures. A detailed list of responsibilities for the Designated Biologist is summarized:

2. The qualified biological monitor shall notify the wildlife regulatory agencies at least 14 calendar days before initiating ground-disturbing activities.
3. The boundaries of all areas to be disturbed (including staging areas, access roads, and sites for temporary placement of spoils) would be delineated with stakes and flagging prior to construction activities. Spoils would be stockpiled in disturbed areas lacking native vegetation or where habitat quality is poor. To the extent possible, disturbance of shrubs and surface soils due to stockpiling would be minimized. All disturbances, vehicles, and equipment would be confined to the flagged areas. To the extent possible, surface disturbance would be timed to minimize mortality to flat-tailed horned lizard.
4. Prior to Project initiation, a worker education program would be developed and implemented by the qualified biological monitor, and would be available in both English and Spanish. Wallet-sized cards summarizing this information would be provided to all construction, operation, and maintenance personnel. The education program would include the following aspects:
  - biology and status of the flat-tailed horned lizard,
  - protection measures designed to reduce potential impacts to the species,
  - function of flagging designating authorized work areas,
  - reporting procedures to be used if a flat-tailed horned lizard is encountered in the field, and
  - driving procedures and techniques, for commuting, and driving on, to the Project site, to reduce mortality of flat-tailed horned lizard on roads.

#### **BIO-7. Flat-tailed horned lizard Measures During Construction**

1. The qualified biological monitor would have the authority and responsibility to halt activities that are in violation of the conservation measures. A detailed list of responsibilities for the monitor during construction is summarized:
  - Be present during construction (e.g., grubbing, grading, facility installation) activities that take place in flat-tailed horned lizard habitat to avoid or minimize

- take of flat-tailed horned lizard. Activities include, but are not limited to, ensuring compliance with all impact avoidance and minimization measures, monitoring for flat-tailed horned lizards and removing lizards from harm's way, and checking avoidance areas (e.g., washes) to ensure that signs, and stakes are intact and that human activities are restricted in these avoidance zones.
- At the end of each work day, inspect all potential wildlife pitfalls (trenches, bores and other excavations) for wildlife and then ensure that each feature is either backfilled or completely and securely covered to prevent wildlife access.
  - Immediately notify the wildlife regulatory agencies in writing, if the Project applicant is not in compliance with any conservation measures, including but not limited to any actual or anticipated failure to implement conservation measures within the time periods specified.
  - During construction, examine areas of active surface disturbance periodically, at least hourly, when surface temperatures exceed 29 degrees Celsius (°C; 85 degrees Fahrenheit [°F]) for the presence of flat-tailed horned lizard.
2. Flat-tailed horned lizards would be removed from harm's way during all construction activities. Flat-tailed horned lizard removal would be conducted by two or more Biological Monitors when construction activities are being conducted in suitable habitat. To the extent feasible, methods to find flat-tailed horned lizards would be designed to achieve a maximal capture rate and would include, but not be limited to using strip transects, tracking, and raking around shrubs. During construction, the minimum survey effort would be 30 minutes per 0.40 hectare (30 minutes per 1 acre). Persons that handle flat-tailed horned lizards would first obtain all necessary permits and authorization from the CDFG. Flat-tailed horned lizard removal surveys would also include:
- A Horned Lizard Observation Data Sheet and a Project Reporting Form, per Appendix 8 of the Rangewide Management Strategy, would be completed. During construction, quarterly reports describing flat-tailed horned lizards removal activity would be submitted to the wildlife regulatory agencies.
3. The removal of flat-tailed horned lizard out of harm's way would include relocation to nearby suitable habitat in low-impact areas of the Yuha Management Area, which is located to the west and south of the Project site. Relocated flat-tailed horned lizards would be placed in the shade of a large shrub in undisturbed habitat. If surface temperatures in the sun are less than 24°C (75°F) or exceed 38°C (100°F), the Designated Biologist or Biological Monitor, if authorized, would hold the flat-tailed horned lizard for later release. Initially, captured flat-tailed horned lizards would be held in a cloth bag, cooler, or other appropriate clean, dry container from which the lizard cannot escape. Lizards would be held at temperatures between 75°F and 90°F and would not be exposed to direct sunlight. Release would occur as soon as possible after capture and during daylight hours. The Designated Biologist or Biological Monitor would be allowed some judgment and discretion when relocating lizards to maximize survival of flat-tailed horned lizards found in the Project area.

4. To the maximum extent practicable, grading in flat-tailed horned lizard habitat would be conducted during the active season, which is defined as March 1 through September 30, or when ground temperatures are between 24°C (75°F) and 38°C (100°F). If grading cannot be conducted during this time, any flat-tailed horned lizards found would be removed to low-impact areas (see above) where suitable burrowing habitat exists, (e.g., sandy substrates and shrub cover).

#### **BIO-8. Flat-tailed horned lizard Compensation**

Pursuant to Title 43 CFR and the Federal Land Policy and Management Act of 1976, federal land management agencies may permit actions that result in flat-tailed horned lizard habitat loss on their lands; however, for losses both within and outside the Management Areas, compensation is charged if residual effects would occur after all reasonable on-site mitigation has been applied. The goal of compensation is to prevent the net loss of flat-tailed horned lizard habitat and make the net effect of a project neutral or positive to flat-tailed horned lizards by maintaining a habitat base for flat-tailed horned lizards. To achieve this goal, compensation will be based on the acreage of flat-tailed horned lizard habitat lost after all reasonable on-site mitigation has been applied at a 1:1 ratio for habitat lost outside a flat-tailed horned lizard Management Area. For this Project, compensation will be required for a loss of 54 acres of flat-tailed horned lizard habitat.

Implementation of the mitigation and monitoring measures listed above would reduce impacts to flat-tailed horned lizard to a level of less than significant.

### **5.3.2 Mitigation and Monitoring Recommendations for Colorado Desert Fringe-toed Lizard**

The following measures are recommended to mitigate for direct and indirect impacts to Colorado Desert fringe-toed lizard and its habitat. Implementation of mitigation measure BIO-4, including enforcement of speed limits and implementing the worker education program, would minimize impacts during O&M activities.

#### **BIO-9. Colorado Desert Fringe-toed Lizard Measures During Construction**

1. A qualified biological monitor as defined in BIO-1 and BIO-6 would be identified to implement monitoring for this species.
2. Colorado Desert fringe-toed lizard would be removed from harm's way during all construction activities, either through flushing or relocation, if individuals are able to be captured.
3. The removal of Colorado Desert fringe-toed lizard out of harm's way would include relocation to nearby suitable habitat in low-impact areas of the Yuha Management Area located west and south from the Project site. Initially, captured lizards would be held in a cloth bag, cooler, or other appropriate clean, dry container from which the lizard cannot escape. They would be held at temperatures between 75°F and 90°F and would not be exposed to direct sunlight. Relocated individuals would be placed in the

shade of a large shrub in undisturbed habitat. If surface temperatures in the sun are less than 24°C (75°F) or exceed 38°C (100°F), the qualified biological monitor would hold the individuals for later release. Release would occur as soon as possible after capture and during daylight hours.

Implementation of the mitigation and monitoring measures listed above would reduce impacts to Colorado Desert fringe-toed lizard to a level of less than significant.

### **5.3.3 Mitigation and Monitoring Recommendations for Burrowing Owl**

The following measures are recommended to mitigate for direct and indirect impacts to burrowing owl and its habitat. Implementation of mitigation measure BIO-4, including enforcement of speed limits and implementing the worker education program, would minimize impacts during O&M activities.

#### **BIO-10. Recommended Burrowing Owl Measures**

1. As the construction schedule and details are finalized, a Qualified Biologist would prepare a Conceptual Burrowing Owl Mitigation Plan in accordance with the CDFW 2012 Staff Report or the most recent state and/or federal protocols/guidance for approval by the relevant resource agencies. Consultation with CDFW may be necessary during their review of the proposed plan in order to gain their approval. The Conceptual Burrowing Owl Mitigation Plan would include off-site mitigation for the loss of 155 acres of suitable burrowing owl winter foraging habitat at a ratio of 1:1. The quality of preserved suitable occupied burrowing owl habitat must be comparable to or better than the habitat being impacted. The land to be preserved must be occupied by burrowing owl and support fossorial mammals. A conservation easement for the protection of burrowing owl/habitat would be placed over the mitigation land.
2. A Mitigation Land Management Plan for the long-term maintenance and monitoring of the approved mitigation land would be prepared to identify a long-term funding mechanism (e.g., an endowment) for the maintenance of the mitigation lands for burrowing owl.
3. Initial grading should take place between September 1 and January 31 to avoid impact to breeding burrowing owls (CDFW 2012). If construction is to begin during the breeding season, it is recommended that the measures below be implemented prior to February 1 to discourage the nesting of the burrowing owls within the area of impact. As construction continues, any area where owls are sighted should be subject to frequent surveys for burrows before the breeding season begins, so that owls can be relocated before nesting occurs.
4. Pre-construction surveys would be conducted for burrowing owls prior to the commencement of construction activities. The surveys would conform to the survey protocol in the CDFW 2012 Staff Report. No more than 14 days prior to any ground-

disturbing activities, a Qualified Biologist would conduct a take avoidance survey for burrowing owls. If no owls are found during this first survey, a final survey would be conducted 24 hours prior to ground disturbance to confirm that burrowing owls are absent.

5. If burrowing owls are found on the site during the surveys, any potentially impacted burrowing owl individuals must be relocated out of the impact area using passive or active methodologies approved by the resource agencies. A Burrow Exclusion Plan would be prepared according to the 2012 CDFW guidelines and approved by CDFW. The Burrow Exclusion Plan may include the use of artificial burrows as a means of replacing burrows lost to impacts.
6. A biologist familiar with burrowing owl biology would monitor construction activities to make sure that burrowing owls that may move into the area during construction are detected and impacts are avoided.

Implementation of the mitigation and monitoring measures listed above would reduce impacts to burrowing owl to a level of less than significant.

### **5.3.4 Mitigation and Monitoring Recommendations for Nesting Birds**

Implementation of mitigation measures BIO 1-4 is expected to avoid direct impacts to nesting birds. Implementation of these mitigation and monitoring measures and other species-specific measures discussed above would reduce impacts to nesting birds to a level of less than significant.

### **5.3.5 Mitigation and Monitoring Recommendations for American Badger**

The following measures are recommended to mitigate for direct and indirect impacts to American badger. Implementation of mitigation measure BIO-4, including enforcement of speed limits and implementing the worker education program, would minimize impacts during O&M activities.

#### **BIO-11. American Badger Measures During Construction**

1. A qualified biological monitor would conduct a pre-construction survey for American badger concurrent with the pre-construction survey for burrowing owl.
  - a. If badgers are detected between September and January, which is outside of the breeding/denning season, the qualified biological monitor would monitor the den to determine the status, whether active or inactive. Dens determined to be potentially inactive would be passively excluded using one-way doors and excavated/collapsed once it has been established that the den is empty. If an active den is detected within the work area, the Project Proponent would avoid the den,

if feasible, until the qualified biological monitor determines the den is no longer active.

- b. Any badger dens detected during the denning season March through August would be flagged and a 100-foot avoidance buffer established where no ground-disturbing activities may occur until the dens are determined to no longer be in use by the family.

Implementation of the mitigation and monitoring measures listed above would reduce impacts to American badger to a level of less than significant.

## 5.4 Mitigation and Monitoring Recommendations for Jurisdictional Wetlands and Waters

The proposed Project would impact total of 0.21 acres of USACE jurisdictional resources, and 9.43 acres of CDFW jurisdictional resources. A breakdown of permanent and temporary impacts, as well as the proposed mitigation required to offset these impacts is shown on Table 8.

Impact to jurisdictional waters of the U.S. on-site would require a permit under Section 404 CWA from USACE and a Section 401 state water quality certification from RWQCB. In addition, a Section 1600 Streambed Alteration Agreement would also need to be authorized for impact to CDFW resources. Mitigation ratios would be determined at that time.

Implementation of **BIO-5** should include the proposed restoration and mitigation proposed for impacts to jurisdictional waters.

Table 8 Proposed Mitigation for Impacts to Jurisdictional Waters						
	Permanent			Temporary		
	Impacts (acres)	Mitigation Ratio	Mitigation (acres)	Impacts (acres)	Mitigation Ratio	Mitigation (acres)
USACE Total Jurisdictional Waters (404)						
<b>Non-wetland Waters of the U.S.</b>	<b>0.04<sup>1</sup></b>	<b>1:1</b>	<b>0.04</b>	<b>0.16<sup>1</sup></b>	<b>1:1</b>	<b>0.16</b>
CDFW and RWQCB Total Jurisdictional Waters (1602/401) <sup>3</sup>						
Wetland Waters of the State	6.71	2:1	13.42	2.51	1:1	2.51
Streambed	0.04 <sup>1</sup>	1:1	0.04	0.16 <sup>1</sup>	1:1	0.16
<b>Total CDFW/RWQCB</b>	<b>6.75</b>		<b>13.46</b>	<b>2.67</b>		<b>2.67</b>
<sup>1</sup> Approximately 0.10 acre of open water within the Westside Main Canal would be spanned with a bridge. This is illustrated as a permanent impact, but given the fact that there would be no direct impact to the canal, this is included within the temporary impacts.						

Implementation of the mitigation and monitoring measures listed above would reduce impacts to jurisdictional waters to a level of less than significant.

Addendum to the Biological Resources Report for  
the Westside Canal Battery Storage Project  
Imperial County, California

*An Employee-Owned Company*

January 18, 2021

Mr. Curtis Kebler  
Director, Business Development  
Con Edison Clean Energy Businesses  
101 W. Broadway, Suite 1120  
San Diego, CA 92101

Reference: Addendum to the Biological Resources Report for the Westside Canal Battery Storage Project,  
Imperial County, California (RECON Number 8888-1)

Dear Mr. Kebler:

This letter describes the additional biological survey and analysis conducted for the proposed southern access route for the Westside Canal Battery Storage Project (Project) in support of the request for a Right-of-Way grant from the Bureau of Land Management (BLM). The Project is currently proposed by Westside Canal Battery Storage, LLC, a subsidiary of Con Edison Clean Energy Businesses. This letter is being submitted as an addendum to the Biological Resources Report prepared for this Project (RECON 2021). The Biological Resources Report did not include an analysis of this southern access route, which has been proposed as a potential temporary access route to support construction of the proposed bridge spanning IID's Westside Main Canal.

### **Location and Description**

The proposed southern access route begins at the entrance to the San Diego Gas & Electric-owned Imperial Valley Substation and follows an existing dirt access road that leads north, then east, along the western and northern boundaries of the substation (Figure 1). The proposed southern access route then continues northwest along an existing dirt access road that parallels two power lines until the access road connects with the western edge of the Project site. The proposed southern access route is approximately 1.2 miles long.

The Project is surrounded by private landowners to the east, Bureau of Land Management (BLM) land to the south and west, and Imperial Irrigation District (IID) maintenance roads and Westside Main Canal to the north. Due to the need to access the site on both the north and south side of the West Main Canal to initiate construction of the proposed bridge, the applicant is proposing to utilize the access route leading from the Imperial Valley Substation until the permanent bridge is constructed. The applicant is proposing to construct a new clear-span Imperial County-specified bridge to span the Westside Main Canal which would connect to a proposed access road easement on the north side of the Westside Main Canal. The north side proposed access road would ultimately connect the Project to Liebert Road, which is a county road. Once access to the Project site is secured from Liebert Road, the temporary southern access route would no longer be utilized.

Use of the temporary southern access route would consist of driving construction-related trucks and equipment along the existing dirt access road in order to access the south side of the Westside Main Canal. Minor road improvements may be necessary in certain areas where small sand dunes have formed within the roadbed. These small dunes would be graded level using a skid steer or similar piece of equipment. In areas where the existing access road contains loose sand, a matting would be laid down within the existing roadbed to provide stability for construction equipment. The type and total quantity of matting has yet to be determined.

 Project Boundary  
 Access Route

FIGURE 1  
Westside Canal Battery Storage Project  
Proposed Temporary Access Route

## Survey Methods

For the purposes of this addendum letter, the survey area includes a 300-foot corridor centered along the proposed southern access route (see Figure 1). RECON biologist Andrew Smisek conducted a general biological survey within the survey area on March 26, 2020, between 11:00 a.m. and 3:00 p.m. A resume for Mr. Smisek is included as Attachment 1. The survey area totals approximately 42 acres. Weather conditions during the survey consisted of sunny skies, 5- to 10-mile-per-hour winds, and air temperatures between 70 and 75 degrees Fahrenheit. During the survey, Mr. Smisek inventoried plant and wildlife species, conducted a search for sensitive species, and assessed the suitability of habitat for sensitive species identified as having potential to occur based on the previous literature review discussed in the Biological Resources Report (RECON 2019). This included an assessment for potential use by flat-tailed horned lizard (*Phrynosoma mcallii*) and burrowing owl (*Athene cunicularia*). The burrowing owl habitat assessment consisted of an assessment of vegetation types, height, and density; land use; presence or absence of friable soils and/or burrows; topography; hydrological features; and presence or absence of burrowing owl sign.

According to precipitation data for El Centro, California, observed precipitation was above normal for the period of January through March, 2020. A total of approximately 1.75 inches of rain fell during this period, compared to the historical average of 1.07 inches for this period (National Climate Data Center 2020a and 2020b). The above-normal rainfall likely resulted in substantial germination rates for annual plant species within the survey area at the time the survey. Therefore, the majority of sensitive annual plant species would have likely been detected if present during the general biological survey.

Prior to conducting the survey, Mr. Smisek reviewed aerial photographs, U.S. Geological Survey topographic maps of the site, U.S. Department of Agriculture soil maps of the site, and the U.S. Fish and Wildlife Service (USFWS) National Wetland Inventory. The survey included a search for potential federal and state jurisdictional areas following the guidelines set forth by U.S. Army Corps of Engineers (1987 and 2008).

## Survey Results

The following vegetation communities and land cover types were mapped within the survey area: creosote bush scrub (*Larrea tridentata* Shrubland Alliance), disturbed habitat, and developed land (Figure 2). A brief description of each community or land cover type is also provided below.

Creosote bush scrub occurs throughout the survey area as part of a large expanse of this vegetation community and as slivers of habitat occurring between dirt access roads and the substation. On-site areas containing this community appear to be in their natural, intact state, not having been subjected to historical disturbance like those areas of creosote bush scrub within the Project site. Creosote bush (*Larrea tridentata*) is the dominant species, occurring with a vegetation cover of approximately 10 percent and shrub height averaging five to six feet. White bur-sage (*Ambrosia dumosa*) occurs as a sub-dominant species at approximately 2 percent cover. Since the recent rain events in the vicinity of the Project, creosote bush scrub within the survey area also contains a consistent cover of herbaceous annual plant species, including narrow-leaf cryptantha (*Cryptantha angustifolia*), desert indianwheat (*Plantago ovata*), and Mediterranean schismus (*Schismus barbatus*).

Disturbed habitat consists of the dirt access road and other bare areas surrounding the existing power poles that are subjected to continued disturbance, preventing establishment of substantial vegetation cover. The few plants that occur within or along the edges of these areas include Mediterranean schismus and desert indianwheat.

Developed land within the survey area consists of those areas that overlap portions of the Imperial Valley Substation, which occurs as a gravel yard containing a number of various power structures and surrounded by a chain-link fence.

| Southern Access Route Survey Area | Creosote Bush Scrub           |
| Yuha Desert Management Area       | Developed                     |
| Access Route                      | Disturbed Habitat             |

FIGURE 2  
Existing Biological Resources

No jurisdictional resources were observed within the survey area. Although some small erosional features were observed along the dirt access road and a small area is topographically situated such that brief periods of ponding may occur during significant rain events, these features did not exhibit sufficient hydrology or hydric soil indicators to be considered potentially jurisdictional. No portions of the survey area contain hydrophytic vegetation.

Wildlife observed during the survey include northern desert iguana (*Dipsosaurus dorsalis dorsalis*), rock dove (*Columba livia*), common raven (*Corvus corax clarionensis*), harvester ant (*Veromessor* sp.), painted lady (*Vanessa cardui*), and duskywing (*Erynnis* sp.).

### **Regulatory Framework**

A number of state and federal regulations or policies apply to the biological resources within and/or adjacent to the survey area. This includes the federal Endangered Species Act (ESA), the Migratory Bird Treaty Act (MBTA), the California Environmental Quality Act (CEQA), the California ESA, and Section 3503 of the California Fish and Game Code. More detail regarding these regulations and policies can be found in the Biological Resources Report (RECON 2019).

### **Sensitive Biological Resources**

No sensitive plant species were observed during the survey and none were observed or are expected within the Project site based on the analysis conducted for the Biological Resources Report (RECON 2019). However, the creosote bush scrub in the survey area for the southern access route has potential to support two sensitive rare plant species, Watson's amaranth (*Amaranthus watsonii*; California Rare Plant Rank 4.3) and Abram's spurge (*Euphorbia abramsiana*; California Rare Plant Rank 2B.2). Unlike the creosote bush scrub within the Project site, that along the potential southern access route has not been historically disturbed and, therefore, may provide suitable habitat for these species. These two sensitive annual plant species would not have been apparent at the time of the March 2020 survey because they do not develop into their vegetative or flowering stages until summer and fall. These species are not expected to occur in the disturbed habitat within the dirt access roads proposed to be used as the southern access route.

Flat-tailed horned lizard is a California Department of Fish and Wildlife (CDFW) species of special concern and BLM sensitive species. Many occurrences of flat-tailed horned lizard have been reported in the undeveloped desert areas within the survey area and immediately adjacent to the southern access route (CDFW 2020), and horned lizard tracks were observed during 2018 surveys in the western portion of the Project site. Given the cryptic nature and resulting difficulty of detection without focused surveys, these historical records are sufficient to assume this species is present in the creosote bush scrub and adjacent disturbed habitat within the survey area. The creosote bush scrub provides high-quality habitat for this species, as it contains sandy hummocks, a good diversity of native plant species, and harvester ants.

Colorado Desert fringe-toed lizard (*Uma notata*) is a CDFW species of special concern and BLM sensitive species. Although it has not been detected during previous project surveys, this species has been reported in similar habitat within two miles of the Project site (CDFW 2020) and has a moderate potential to occur. The creosote bush scrub within the survey area provides suitable habitat for this species due to the presence of small dunes and sandy hummocks.

Burrowing owl is a CDFW species of special concern and BLM sensitive species. As reported in the Biological Resources Report (RECON 2019), four burrowing owl observations were recorded within the Project site during the 2018-2019 focused surveys, as well as a number of potentially suitable burrows. Within the survey area, the creosote bush scrub and disturbed habitat may provide suitable habitat for this species to forage due to the open structure of the vegetation and presence of prey items. However, no potentially suitable burrows were observed during the March 2020 survey and habitat assessment, and it is unlikely that burrowing owls are currently breeding within the survey area.

Other sensitive wildlife with potential to utilize the habitats within the survey area include loggerhead shrike (*Lanius ludovicianus*; CDFW species of special concern), black-tailed gnatcatcher (*Poliophtila melanura*; CDFW watch list species), Abert's towhee (*Melospiza aberti*; CDFW Special Animal List), and pallid bat (*Antrozous pallidus*; CDFW species of concern and BLM sensitive species).

### Impact Analysis

Because the use of the proposed southern access route would be contained within the existing dirt access road (mapped as disturbed habitat), no impacts are expected to occur to creosote bush scrub or any potentially occurring rare plants, including Watson's amaranth or Abram's spurge, within this vegetation community. No rare plants are expected to occur within the disturbed habitat of the dirt access road. Additionally, although burrowing owl may utilize the survey area for foraging, no burrows occur within the dirt access road. Therefore, this species is not expected to be impacted by the use of the southern access route. Although potentially occurring loggerhead shrike, black-tailed gnatcatcher, Abert's towhee, and/or pallid bat may utilize the creosote bush scrub within the survey area, these species are not expected to utilize the disturbed habitat within the dirt access road or be impacted by the use of the dirt access road.

Flat-tailed horned lizard and Colorado Desert fringe-toed lizard, both of which are CDFW species of special concern and BLM sensitive species, have potential to be directly impacted within the existing access road as a result of vehicle strike. Any impacts to individual flat-tailed horned lizards or Colorado Desert fringe-toed lizards would be considered significant and require mitigation.

### Recommended Avoidance Measures

The proposed southern access route occurs entirely within the Yuha Desert Flat-tailed Horned Lizard Management Area (see Figure 2), as designated in the Flat-tailed Horned Lizard Rangewide Management Strategy (RMS; ICC 2003). In accordance with the RMS, the measures proposed below are designed to avoid and/or minimize potential direct impacts to flat-tailed horned lizard throughout the duration of use of the southern access route:

- Use of the southern access route should be scheduled to occur as much as possible during the flat-tailed horned lizard's dormant period, November 15 to February 15, and the schedule for use of this access route should be approved by the BLM before construction begins.
- For any use of the southern access route during the flat-tailed horned lizard's active period, before November 15 or after February 15, a qualified biological monitor (as defined in the Biological Resources Report) that is trained to recognize flat-tailed horned lizard and approved by the BLM should be present onsite to keep the road clear for vehicular use.
- Prior to use, the southern access route will be delineated with stakes and flagging.
- As described in the Biological Resources Report, prior to use of the southern access route, a worker education program should be developed and implemented by the qualified biological monitor, and should be available in both English and Spanish. Wallet-sized cards summarizing this information should be provided to all construction, operation, and maintenance personnel. The education program should include the following aspects:
  - Biology and status of the flat-tailed horned lizard;
  - Protection measures designed to reduce potential impacts to the species;
  - Function of flagging designating authorized work areas;
  - Reporting procedures to be used if a flat-tailed horned lizard is encountered in the field; and
  - Driving procedures and techniques, for commuting, and driving on to the Project site, to reduce mortality of flat-tailed horned lizard on roads.
- Prior to any grading of sand dunes within the access road or installation of matting material, a qualified biological monitor shall notify the wildlife regulatory agencies at least 14 calendar days before initiating these ground-disturbing activities.

- The qualified biological monitor shall be present during ground-disturbing activities to monitor for flat-tailed horned lizards and remove lizards from harm's way. The removal of flat-tailed horned lizard out of harm's way should include relocation according to the standards (e.g., handling techniques, temperature restrictions, notification, etc.) established in the Biological Resources Report and in accordance with the RMS.
- Speed limits along all access roads should not exceed 15 miles per hour (mph). The qualified biologist may reduce this speed limit to 10 mph in areas identified as active wildlife corridors as needed to reduced mortality. All construction-related vehicles must remain on the designated access roads. Cross country vehicles and equipment use outside of designated work areas in suitable flat-tailed horned lizard habitat shall be prohibited.
- During use of the southern access route, the construction contractor should establish and implement measures for storage and disposal of all litter and trash produced during construction and operations & maintenance. This is designed to discourage scavengers, such as ravens, that may prey on potentially occurring flat-tailed horned lizard.

No compensatory mitigation is proposed for impacts to flat-tailed horned lizard from the use of the southern access route because construction access to this area would be temporary and would not result in the loss of any flat-tailed horned lizard habitat. In accordance with the RMS, no compensatory mitigation would be required since the avoidance measures proposed above are expected to eliminate all adverse, on-site effects to flat-tailed horned lizard.

The following measures are recommended to avoid direct impacts to Colorado Desert fringe-toed lizard throughout the duration of use of the southern access route:

- A qualified biological monitor (as defined in the Biological Resources Report) shall be present during ground disturbing activities to monitor for Colorado Desert fringe-toed lizard and remove any individuals from harm's way, either through flushing or relocation, if individuals are able to be captured.
- The removal of Colorado Desert fringe-toed lizard out of harm's way would include relocation to nearby suitable habitat according to the standards established in the Biological Resources Report.

If you have any questions concerning the contents of this letter, please contact me by phone or e-mail at (619) 308-9333 extension 158 or [asmisek@reconenvironmental.com](mailto:asmisek@reconenvironmental.com).

Sincerely,

Andrew Smisek  
Biologist

## Biologist

---

### Experience Highlights

- ✓ Wetland delineations, reporting, and permitting
- ✓ CRAM
- ✓ Quino checkerspot butterfly surveys and reporting
- ✓ Construction/environmental compliance monitoring
- ✓ Biological constraints surveys and reporting
- ✓ Rare plant surveys and reporting

### Experience

5 years

### Education/Registrations

B.S. Biology, University of Wisconsin

### Certifications/Permits

CDFW Scientific Collecting Permit for amphibians, birds, invertebrates (California vernal pool branchiopods [fairy shrimp] and terrestrial invertebrates), and reptiles

CDFW California Endangered Species Act Plant Voucher Collecting Permit

CDFW Flat-Tailed Horned Lizard Training and Certification

OSHA 10-Hour Training Course in Construction Safety and Health

USFWS Permit TE-797665 for Quino checkerspot butterfly and vernal pool branchiopods

Mr. Smisek conducts vegetation analyses, habitat assessments, rare plant surveys, bird nest surveys, and environmental compliance monitoring in a variety of habitats in southern California. He is experienced with GPS and GIS systems to map and record vegetation types and sensitive species occurrences.

---

### Brand's Phacelia Census Project on Lichty Mesa, San Diego, CA

Mr. Smisek assisted in sensitive plant species surveys on the international border. The project focused on the status of a Brand's phacelia population as required by a Candidate Conservation Agreement. All sensitive plant species in the survey area were mapped and counted with the assistance of sub-meter GPS technology.

### Sierra Alta Way Wastewater Emergency Pipe Replacement Project, San Diego County, CA

Mr. Smisek prepared a post-construction jurisdictional waters/wetland delineation report for an emergency sewer pipe replacement project for the County. The analysis included historical land use issues which created an atypical situation on-site, as well as the project's compliance with the County's Regional General Permit #63.

### North Chollas Community Park Concession Stand and Restrooms Project, San Diego, CA

Mr. Smisek conducted a general biology survey and submitted a biological letter report in accordance with the City's Biology Guidelines for the proposed development within Chollas Park.

### Mission Valley Preserve California Rapid Assessment Method Survey, San Diego, CA

Mr. Smisek assisted in conducting a CRAM survey within a portion of the Mission Valley Preserve along the San Diego River. The CRAM results were uploaded to the eCRAM database.

### Otay Mesa Southwest Village Specific Plan, San Diego, CA

The Southwest Village Specific Plan would allow up to approximately 4,000 residences, a commercial and retail use area, elementary school site, parks, and open space

**Training**

Wetland Delineation, Wetland Training Institute

California Rapid Assessment Method Certified

Poaceae Workshop, The Jepson Herbarium

Monkeyflowers in the Field, Rancho Santa Ana Botanic Garden

Introductory Bird Course, San Diego Audubon Society

Keying with the Second Edition of The Jepson Manual, The Jepson Herbarium

**Affiliations**

San Diego River Park Foundation

Friends of Mission Valley Preserve

California Native Plant Society

Center for Natural Lands Management

Friends of Maple Canyon

and undeveloped areas. Mr. Smisek conducted focused Quino checkerspot butterfly surveys on this project site within the Otay Mesa area and prepared a report which was submitted to the USFWS.

**Jurisdictional Waters/Wetland Delineation for the Rancho Vistoso Neighborhood 5 Project, Oro Valley, AZ**

Mr. Smisek delineated jurisdictional non-wetland waters within the 190-acre project site and prepared a waters/wetland delineation report.

**El Capitan Dam Spillway Vegetation Removal Project, San Diego County, CA**

Mr. Smisek assisted in conducting both a wetland delineation and a CRAM survey within the project site, and prepared a waters/wetland delineation report for the City of San Diego. Mr. Smisek also conducted focused Quino checkerspot butterfly surveys and led focused rare plant surveys within the 75-acre project survey area. He reported on rare plant results and prepared a Quino checkerspot butterfly survey report which was submitted to the USFWS.

**County of San Diego Department of Public Works Adjunct Staff, CA**

Mr. Smisek provides in-house support to the Environmental Services Unit at the County Department of Public Works. This ongoing support includes pre-construction wetland and biological surveys and analysis, assisting with post-construction mitigation compliance and agency communication, and coordinating compliance with wetland impacts associated with the County's Regional General Permit #53.

**Ashwood Street Corridor Improvement Project, San Diego County, CA**

Mr. Smisek prepared a biological letter report for the proposed Phase 1 project impacts that included an analysis of the potential for impacts to a number of sensitive species, the including coastal California gnatcatcher, glossy snake, and arroyo toad. Mr. Smisek also provided Phase 1 implementation recommendations and coordinated biological monitoring during construction.

**Helix Canyon Estates, San Diego County, CA**

Mr. Smisek conducted a general biology survey and submitted a biological letter report in accordance with

the County's Report Format and Content Requirements and the Multiple Species Conservation Program for the proposed development of a parcel in western San Diego County.

**Beyer Park Development Project, San Diego, CA**

Mr. Smisek conducted sensitive plant species surveys and vegetation mapping throughout the approximately 60-acre survey area. A total of 13 rare plants were found, including the state and federally listed Otay tarplant. All sensitive plant species in the survey area were mapped and counted with the assistance of sub-meter GPS technology.

**Pacific Beach Drive Crown Point/Olney Sidewalk Project, San Diego, CA**

Mr. Smisek conducted noise monitoring to ensure no impacts occurred to adjacent marsh habitat considered occupied by Belding's savannah sparrow and the federally listed Ridgway's rail within the adjacent Multi-Habitat Planning Area.

**Sheriff's Department Emergency Vehicle Operations Course, San Diego County, CA**

Mr. Smisek conducted a general biological survey and created a biological constraints report which included an assessment of the potential to impact a number of sensitive species and advisement on impacts to critical habitat for coastal California gnatcatcher, Quino checkerspot butterfly, least Bell's vireo, and golden eagle.

**San Diego River Park Foundation Discovery Center, San Diego, CA**

Mr. Smisek conducted a biological resources survey and prepared a biological technical report in accordance with the City's Biology Guidelines. Mr. Smisek worked directly with City staff to update the MHPA Boundary Line Adjustment and Biological Superior Option discussion.

**Temescal Wetland Creation, San Diego, CA**

Mr. Smisek created a restoration plan for wetland creation at an off-site mitigation area following City of San Diego guidelines. The restoration plan describes the activities which will take place over a five-year period involving habitat creation and enhancement and how the project will meet mitigation requirements. The plan includes clearly defined goals and objectives of the restoration project; an implementation plan;

---

maintenance tasks; qualitative and quantitative monitoring methods; performance goals; and contingency measures to implement if the project fails to meet final performance goals.

**Alpine Boulevard Streetscaping Project, Alpine, CA**

Mr. Smisek regularly conducted monitoring visits and nesting bird surveys during project construction to ensure construction activities were consistent with avian and wetland mitigation and compliance measures.

**El Cajon Mountain Preserve, San Diego County, CA**

Mr. Smisek was the project manager for this project which included establishing methods for and conducting rare plant census surveys, Quino checkerspot butterfly habitat suitability surveys, focused western spadefoot and general wildlife surveys, and invasive plant species surveys. Data was collected using tablets with a sub-meter accuracy GPS extension. Mr. Smisek prepared a preserve management report and worked closely with GIS staff to compile the data into maps tailored for preserve management purposes.

**Jonas Salk Elementary School Project Vernal Pool Mitigation, San Diego, CA**

Mr. Smisek assisted in wet-season and dry-season San Diego fairy shrimp and other aquatic crustacean surveys as well as water quality measurements within restored and reference pools.

**Murrieta Creek Monitoring Project Phase I and Phase IIa, City of Temecula, Riverside County, CA**

Mr. Smisek conducted construction monitoring to identify potential biological issues within the work area and to ensure environmental compliance. Tasks included occupied burrowing owl and least Bell's vireo habitat monitoring, coordination with construction crews, meeting attendance, and daily reporting.

**Rolling Hills Ranch Preserve, Chula Vista, CA**

Mr. Smisek conducted general biological surveys, including mapping vegetation communities and recording rare plant and wildlife populations.

**Brand's Phacelia Census Project on Lichty Mesa, San Diego, CA**

Mr. Smisek assisted in sensitive plant species surveys on the international border. The project focused on the status of a Brand's phacelia population as required by a Candidate Conservation Agreement. All sensitive plant

---

species in the survey area were mapped and counted with the assistance of sub-meter GPS technology.

**City Heights Canyons Enhancements and Trails Project, San Diego, CA**

Mr. Smisek created a revegetation plan for four urban canyons within the city of San Diego. The revegetation plan describes the activities which will take place over a five-year period and involve habitat enhancement and restoration, installation of trails, and other project components. The revegetation plan includes clearly defined goals and objectives of the revegetation project; documentation of pre-restoration on-site conditions; an implementation plan; maintenance tasks; qualitative and quantitative monitoring methods; performance goals; and contingency measures to implement if the project fails to meet final performance goals.

**SDG&E NCCP Environmental Enhancement, San Diego and Orange Counties, CA**

Mr. Smisek provided restoration consulting services to SDG&E in support of the Natural Community Conservation Plan and the Enhancement and Monitoring Program. He conducted post-construction site assessments and annual monitoring of enhancement sites, prepared implementation plans, and maintained database entries to track progress of various sites throughout San Diego County.

**SDG&E Sunrise Powerlink Habitat Restoration AWCS, San Diego and Imperial Counties, CA**

Mr. Smisek coordinated remedial restoration tasks including shrub transplantation and protection. He also coordinated seed collection and application tasks specific to U.S. Forest Service requirements. He assisted in primary restoration tasks including qualitative and quantitative monitoring, seed collection, and coordinating the treatment of invasive plants found in temporary and permanent impact areas. He served as a botanical monitor for this project and assisted in rare plant surveys, including listed species such as San Diego thornmint, and rare plant seed collection. Mr. Smisek also assisted in the project-related plot treatment experiments in Mount Laguna and focused invasive plant surveys.

**Otay Ranch Preserve Habitat Management, Chula Vista, CA**

Mr. Smisek conducted focused Quino checkerspot butterfly protocol surveys and rare plant surveys on a

---

number of parcels throughout the 11,000-acre Otay Ranch Preserve in an effort to update sensitive species population data and provide preserve management guidance.

**Alta Del Mar, San Diego, CA**

Mr. Smisek conducted construction monitoring to ensure environmental compliance during soil disturbance activities adjacent to vernal pools in the Shaw Lorenz development.

**Pacific Highlands Ranch, San Diego, CA**

Mr. Smisek conducted construction monitoring to ensure environmental compliance during brush clearing and soil disturbance activities as well as noise monitoring next to the occupied coastal California gnatcatcher habitat and suitable habitat for least Bell's vireo in the Pacific Highlands Ranch Development.

## **ATTACHMENT 4**

### **Sensitive Plant Species Observed or with the Potential to Occur**

Attachment 4					
Sensitive Plant Species Observed or with the Potential for Occurrence					
Scientific Name Common Name	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
<b>LYCOPODS</b>					
<b>SELAGINELLACEAE</b> <b>FAMILY</b>	<b>SPIKE-MOSS</b>				
<i>Selaginella eremophila</i> desert spike-moss	2B.2	Perennial; creosote bush scrub; shaded crevices and rocky places; elevation less than 2,953 feet.	No	Not expected to occur	The Project site and surrounding areas lack suitable shaded and/or rocky areas to support this species. In addition, this species would have been apparent if present.
<b>ANGIOSPERMS: DICOTS</b>					
<b>AMARANTHACEAE</b>	<b>AMARANTH FAMILY</b>				
<i>Amaranthus watsonii</i> Watson's amaranth	4.3	Annual herb; blooms August– September; creosote bush scrub and wetlands.	No	Not expected to occur	Surveys were conducted at the appropriate time of year to detect this species in vegetative state if present.
<b>APIACEAE</b>	<b>CARROT FAMILY</b>				
<i>Eryngium aristulatum</i> var. <i>parishii</i> San Diego button-celery	FE, CE, 1B.1	Biennial/perennial herb; vernal pools, mesic areas of coastal sage scrub and grasslands, blooms April–June; elevation less than 2,000 feet. Known from San Diego and Riverside counties. Additional populations occur in Baja California, Mexico.	No	Not expected to occur	The Project site and surrounding areas lack suitable vernal pool or open vernally mesic habitat to support this species.
<b>APOCYNACEAE</b>	<b>DOGBANE FAMILY</b>				
<i>Funastrum utahense</i> Utah vine milkweed	4.2	Perennial herb; blooms April– June; creosote bush scrub; elevation below 3,281 feet.	No	Not expected to occur	Surveys were conducted at the appropriate time of year to detect this species if present.

Attachment 4					
Sensitive Plant Species Observed or with the Potential for Occurrence					
Scientific Name Common Name	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
<b>APODANTHACEAE                      STEMSUCKER FAMILY</b>					
<i>Pilostyles thurberi</i> Thurber's pilostyles	4.3	Perennial herb (parasitic on <i>Psorothamnus</i> ); blooms January; Sonoran desert scrub; sandy alluvial plains; elevation less than 984 feet.	No	Not expected to occur	This species has been reported within two miles of the Project site (CDFW 2019a). However, no <i>Psorothamnus</i> was observed in the Project site or adjacent areas to support this species.
<b>ASTERACEAE                      SUNFLOWER FAMILY</b>					
<i>Chaenactis carphoclinia</i> var. <i>peirsonii</i> <i>Peirson's pincushion</i>	1B.3	Annual herb; blooms March–April; open, rocky or gravelly slopes; creosote bush scrub; elevation less than 1,640 feet.	No	Not expected to occur	The Project site and adjacent areas lack suitable rocky or gravelly slopes to support this species. In addition, surveys were conducted at the appropriate time of year to detect this species if present.
<i>Helianthus niveus</i> ssp. <i>tephrodes</i> Algodones Dunes sunflower	CE, 1B.2, BLM	Perennial herb; blooms March–May; dunes; elevation less than 328 feet.	No	Not expected to occur	The sandy soil and small dunes that occur in and adjacent to the western portion of the Project site, south of Westside Main Canal, may provide suitable habitat for this species. However, surveys were conducted during this species typical blooming period; therefore, it would have likely been apparent if present.
<i>Malperia tenuis</i> <i>brown turbans</i>	2B.3	Annual herb; blooms April and Dec; Sonoran desert scrub; sandy areas and rocky slopes; elevation less than 1,640 feet.	No	Low potential to occur	Records of this species within two miles of the Project site are either very old (from 1964), or lack locational precision (CDFW 2019a University of California 2019). The creosote bush scrub in and adjacent to the Project site may be superficially suitable; however historical agriculture on the site make it unlikely for any historical populations on site to persist at present.

Attachment 4					
Sensitive Plant Species Observed or with the Potential for Occurrence					
Scientific Name Common Name	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
<i>Palafoxia arida</i> var. <i>gigantea</i> giant Spanish-needle	1B.3, BLM	Dunes; blooms March–May.	No	Not expected to occur	This species is mostly reported from eastern Imperial Valley. Surveys were conducted during the typical blooming period for this species; therefore, it likely would have been apparent if present.
<i>Xylorhiza cognata</i> Mecca-aster	1B.2, BLM	Perennial herb; blooms Jan–June; arid canyons and washes; creosote bush scrub; canyons; elevation 65–787 feet.	No	Not expected to occur	No suitable canyons or washes occur within or adjacent to the Project site. Surveys were conducted during the typical blooming period for this species; therefore, it likely would have been apparent if present.
<i>Xylorhiza orcuttii</i> Orcutt's woody-aster	1B.2, BLM	Perennial herb; blooms January–May; creosote bush scrub; barren slopes, canyons; elevation 65–984 feet.	No	Not expected to occur	No suitable canyons or slopes occur in or adjacent to the Project site. Surveys were conducted during the typical blooming period for this species; therefore, it likely would have been apparent if present.
<b>BORAGINACEAE                      BORAGE FAMILY</b>					
<i>Johnstonella</i> [= <i>Cryptantha</i> ] <i>costata</i> ribbed cryptantha	4.3	Annual herb; blooms Feb–May; creosote bush scrub, sandy soil; elevation less than 1,640 feet.	No	Low potential to occur	The nearest record of this species is from Pinto Wash, about 4 miles to the southwest of the site. While this species does occur in creosote bush scrub with sandy soils, historical agriculture on site likely extirpated any populations present.
<i>Johnstonella</i> [= <i>Cryptantha</i> ] <i>holoptera</i> winged cryptantha	4.3	Annual herb; blooms March–April; washes, creosote bush scrub, sandy soil; elevation 328–3,937 feet.	No	Not expected to occur	The Project site and adjacent areas lack suitable washes, slopes, or ridges to support this species. In addition, surveys were conducted at the appropriate time of year to detect this species if present.

Attachment 4 Sensitive Plant Species Observed or with the Potential for Occurrence					
Scientific Name Common Name	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
<i>Nama stenocarpa</i> mud nama	2B.2	Annual/perennial herb; marshes and swamps, lake margins, riverbanks; blooms January–July; elevation less than 1,700 feet.	No	Not expected to occur	One historical occurrence is recorded within two miles of the Project site (CDFW 2019a). However, the Project site and adjacent areas lack suitable intermittently wet areas to support this species. In addition, surveys were conducted at the appropriate time of year to detect this species if present.
<i>Pholisma sonora</i> sand food	1B.2, BLM	Perennial parasitic herb; blooms April–May; dunes; elevation less than 656 feet.	No	Not expected to occur	Two potential host plants of the <i>Ambrosia</i> and <i>Pluchea</i> genera were observed within the Project site. However, surveys were conducted at the appropriate time of year to detect this species if present, and records for this species are restricted to the east side of Imperial Valley.
<b>BRASSICACEAE                      MUSTARD FAMILY</b>					
<i>Lyrocarpa coulteri</i> Coulter's lyrepod	4.3	Perennial herb; blooms April– Dec; creosote bush scrub; dry slopes, gravelly flats, and washes; elevation less than 1,969 feet.	No	Not expected to occur	The Project site and adjacent areas lack suitable slopes, gravelly flats, or washes to support this species. In addition, surveys were conducted during the typical blooming period for this species; therefore, it likely would have been apparent if present.
<b>BURSERACEAE                      TORCHWOOD FAMILY</b>					
<i>Bursera microphylla</i> Little-leaf elephant tree	2B.3	Tree; rocky desert slopes; blooms May–June; elevation less than 2,300 feet.	No	Not expected to occur	The Project site and surrounding areas lack suitable rocky desert slopes to support this species. In addition, as it is a tree, this species would have been apparent if present.
<b>CACTACEAE                      CACTUS FAMILY</b>					
<i>Opuntia wigginsii</i> [= <i>Cylindropuntia echinocarpa</i> ] Wiggins' cholla [Silver cholla]	3.3	Shrub; creosote bush scrub.	No	Not expected to occur	As a perennial succulent of moderate size, this species would have been apparent if present.

Attachment 4					
Sensitive Plant Species Observed or with the Potential for Occurrence					
Scientific Name Common Name	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
<i>Cylindropuntia wolfii</i> Wolf's cholla	4.3	Shrub; blooms April–May; Alluvial fans and rocky slope in Sonoran desert scrub.	No	Not expected to occur	The Project site and surrounding areas lack suitable alluvial fan or rocky slope habitat to support this species. In addition, as a perennial, succulent plant, this species would have been apparent if present.
<b>EUPHORBIACEAE</b> <b>SPURGE FAMILY</b>					
<i>Croton wigginsii</i> Wiggins' croton	CR, 2B.2, BLM	Shrub; blooms March–April; creosote bush scrub; dunes; elevation less than 328 feet.	No	Not expected to occur	Surveys were conducted during the typical blooming period for this species; therefore, it likely would have been apparent if present.
<i>Ditaxis serrata</i> var. <i>californica</i> California ditaxis	3.2	Perennial herb; blooms April– November; washes, canyons; creosote bush scrub; elevation less than 656 feet.	No	Not expected to occur	The Project site and adjacent areas lack suitable canyons or washes to support this species. In addition, surveys were conducted during the typical blooming period for this species; therefore, it likely would have been apparent if present.
<i>Euphorbia</i> [=Chamaesyce] <i>abramsiana</i> Abram's spurge	2B.2	Annual herb; blooms September–November; creosote bush scrub; elevation less than 656 feet.	No	Low potential to occur	The nearest likely extant record of this species is in the Jacumba Wilderness Area, 11 miles to the southwest (University of California 2019). Although rare plant surveys were not conducted during a time of year when this species would have been apparent, this species has a low potential to occur on-site. The Project area has historically been used for agriculture for many years based on historical aerial photography. This intensive use of the land would have likely extirpated any previously existing population of Abram's spurge.

Attachment 4 Sensitive Plant Species Observed or with the Potential for Occurrence					
Scientific Name Common Name	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
<i>Euphorbia</i> [=Chamaesyce] <i>arizonica</i> Arizona spurge	2B.3	Perennial herb; blooms March–April; creosote bush scrub; elevation less than 984 feet.	No	Low potential to occur	The nearest likely extant record of this species is from the In-Ko-Pah area, 20 miles to the west (University of California 2019). While this species does occur in creosote bush scrub, historical agriculture on site likely extirpated any populations present.
<b>FABACEAE</b> <b>LEGUME FAMILY</b>					
<i>Acmispon haydonii</i> pygmy lotus	1B.3	Perennial herb; blooms March–June; creosote bush scrub; elevation 1,969–3,937 feet.	No	Not expected to occur	The Project site is outside this species' known elevational range. In addition, surveys were conducted during the typical blooming period for this species; therefore, it likely would have been apparent if present.
<i>Astragalus crotalariae</i> Salton milk-vetch	4.3	Perennial herb; blooms Jan–April; creosote bush scrub; elevation 60–250 feet.	No	Not expected to occur	The creosote bush scrub and sandy soils in and adjacent to the Project site may provide suitable habitat for this species. However, as this is a perennial species and surveys were conducted during the species' typical blooming period, it likely would have been apparent if present.
<i>Astragalus insularis</i> var. <i>harwoodii</i> Harwood's milk-vetch	2B.2	Annual herb; blooms Jan–May; desert dunes; open sandy flats or stony desert washes; mostly in creosote bush scrub.	No	Not expected to occur	The sandy soils in the western portion, along the edges of, and adjacent to the Project area south of Westside Main Canal may provide suitable habitat. However, surveys were conducted at the appropriate time of year to detect this species if present.
<i>Astragalus lentiginosus</i> var. <i>borreganus</i> Borrego milk-vetch	4.3	Annual herb; blooms March–May; creosote bush scrub, sandy areas; elevation 98–820 feet.	No	Not expected to occur	The sandy soils in the western portion, along the edges of, and adjacent to the Project area south of Westside Main Canal may provide suitable habitat. However, surveys were conducted at the appropriate time of year to detect this species if present.

Attachment 4 Sensitive Plant Species Observed or with the Potential for Occurrence					
Scientific Name Common Name	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
<i>Astragalus magdalenae</i> var. <i>peirsonii</i> Peirson's milk-vetch	FT, CE, 1B.2	Perennial herb; blooms Dec–April; dunes; elevation 164–656 feet.	No	Not expected to occur	The sandy soils in the western portion, along the edges of, and adjacent to the Project area south of Westside Main Canal may provide suitable habitat. However, surveys were conducted at the appropriate time of year to detect this species if present.
<i>Astragalus sabulonum</i> Gravel milk-vetch	2B.2	Annual; sandy or gravelly soils in Mojave and Sonoran deserts; blooms November–April; elevation 160-3,000 feet.	No	Not expected to occur	This species has been reported within two miles of the Project site (CDFW 2019a). The sandy soils in the western portion, along the edges of, and adjacent to the Project area south of Westside Main Canal may provide suitable habitat. However, surveys were conducted at the appropriate time of year to detect this species if present.
<i>Calliandra eriophylla</i> pink fairy-duster	2B.3	Shrub; sandy washes, slopes, and mesas in desert; blooms February–April and/or September–October, following rain; elevation 4,900 feet.	No	Not expected to occur	This species has been reported within two miles of the Project site (CDFW 2019a). However, as this is a perennial shrub species and surveys were conducted during the typical blooming period, it likely would have been detected if present.
<i>Lupinus excubitus</i> [= <i>albifrons</i> ] var. <i>medius</i> Mountin Springs bush lupine	1B.3, BLM	Shrub; blooms March–April; creosote bush scrub; desert washes; elevation less than 3,281 feet.	No	Not expected to occur	The Project site and adjacent areas lack suitable washes to support this species. In addition, as this is a perennial shrub species and surveys were conducted during the typical blooming period, it likely would have been detected if present.

Attachment 4 Sensitive Plant Species Observed or with the Potential for Occurrence					
Scientific Name Common Name	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
<i>Parkinsonia microphylla</i> little-leaved palo verde	4.3	Tree; blooms April–May; creosote bush scrub.	No	Not expected to occur	The Project site and adjacent areas lack suitable rocky slopes to support this species. In addition, as this is a perennial shrub/tree species and surveys were conducted during the typical blooming period, it likely would have been detected if present.
<b>LAMIACEAE</b> <b>MINT FAMILY</b>					
<i>Teucrium cubense</i> ssp. <i>depressum</i> dwarf germander	2B.2	Annual herb; blooms March– May; creosote bush scrub, sandy areas, alkaline flats; elevation less than 797 feet.	No	Not expected to occur	The sandy soils in the western portion, along the edges of, and adjacent to the Project area south of Westside Main Canal may provide suitable habitat. However, surveys were conducted at the appropriate time of year to detect this species if present.
<b>LOASACEAE</b> <b>LOASA FAMILY</b>					
<i>Eucnide rupestris</i> annual rock-nettle	2B.2	Crevices, cliffs in desert; blooms December–April; elevation 1,600-2,000 feet.	No	Not expected to occur	The Project site is outside this species’ known elevational range and lacks suitable crevices or cliffs. Surveys were conducted at the appropriate time of year to detect this species if present.
<i>Mentzelia hirsutissima</i> hairy stickleaf	2B.3	Annual herb; blooms April– May; creosote bush scrub; washes, fans, and slopes; elevation less than 1,969 feet.	No	Not expected to occur	This species has been reported within two miles of the Project site (CDFW 2019a). However, the Project site and adjacent areas lack suitable washes or slopes to support this species. In addition, surveys were conducted at the appropriate time of year to detect this species if present.
<i>Mentzelia tridentata</i> creamy blazing star	1B.3, BLM	Annual herb; blooms April– May; creosote bush scrub; elevation 2,296–3,280 feet.	No	Not expected to occur	The Project site is outside this species’ known elevational range. In addition, surveys were conducted at the appropriate time of year to detect this species if present.

Attachment 4					
Sensitive Plant Species Observed or with the Potential for Occurrence					
Scientific Name Common Name	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
<b>MALVACEAE                      MALLOW FAMILY</b>					
<i>Ayenia compacta</i> California ayenia	2B.3	Perennial herb/shrub; blooms March–April; washes and dry rocky canyons; elevation less than 1,640 feet.	No	Not expected to occur	The Project site and adjacent areas lack suitable washes or rocky canyons in the desert slopes to support this species. In addition, surveys were conducted at an appropriate time of year to detect this species if present.
<i>Herissantia crispa</i> curly herissantia	2B.3	Annual or perennial herb; creosote bush scrub; blooms August–September; elevation less than 2,700 feet.	No	Not expected to occur	This species is only known from a few occurrences on the desert slopes in eastern San Diego county and likely would have been apparent in vegetative state if present.
<i>Horsfordia alata</i> pink velvet-mallow	4.3	Shrub; blooms April and Nov–Dec; creosote bush scrub; rocky canyons and washes; elevation 328–1,640 feet.	No	Not expected to occur	The Project site and adjacent areas lack suitable washes or rocky canyons in the desert slopes to support this species. In addition, surveys were conducted at an appropriate time of year to detect this species if present.
<i>Horsfordia newberryi</i> Newberry's velvet-mallow	4.3	Perennial herb; blooms March–April and November–December; creosote bush scrub; elevation 328–2,625 feet.	No	Not expected to occur	This is a perennial species, and surveys were conducted during its typical blooming period. Therefore, it likely would have been detected if present.
<b>MARTYNIACEAE                      UNICORN-PLANT FAMILY</b>					
<i>Proboscidea althaeifolia</i> desert unicorn-plant	4.3	Perennial herb; blooms in fall; desert washes within creosote bush scrub; elevation less than 3,281 feet.	No	Not expected to occur	The Project site and adjacent areas lack suitable desert washes to support this species. In addition, as this is a perennial species, it likely would have been detected if present.

Attachment 4					
Sensitive Plant Species Observed or with the Potential for Occurrence					
Scientific Name Common Name	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
<b>NYCTAGINACEAE                      FOUR O'CLOCK FAMILY</b>					
<i>Abronia villosa</i> var. <i>aurita</i> chaparral sand verbena	1B.1, BLM	Annual herb; sandy floodplains in inland, arid areas of coastal sage scrub and open chaparral; blooms January–August; elevation 300–5,300 feet.	No	Not expected to occur	The Project site and adjacent areas lack suitable sandy floodplain to support this species. In addition, surveys were conducted at the appropriate time of year to detect this species if present.
<i>Mirabilis tenuiloba</i> Slender-lobed four o'clock	4.3	Perennial herb; blooms March–May; creosote bush scrub; rocky slopes; elevation less than 1,640 feet.	No	Not expected to occur	The Project site and adjacent areas lack suitable rocky desert slopes to support this species. In addition, surveys were conducted at an appropriate time of year to detect this species if present.
<b>ONAGRACEAE                      EVENING-PRIMROSE FAMILY</b>					
<i>Chylismia arenaria</i> sand evening-primrose	2B.2	Annual or perennial herb; sandy washes, rocky slopes, desert scrub; blooms March–April; elevation less than 1,410 feet.	No	Not expected to occur	The Project site and adjacent areas lack suitable sandy washes or rocky slopes to support this species. In addition, surveys were conducted at an appropriate time of year to detect this species if present.
<b>PICRODENDRACEAE                      BITTER-TREE FAMILY</b>					
<i>Tetracoccus hallii</i> Hall's tetracoccus	4.3	Shrub; blooms March–May; creosote bush scrub; rocky slopes and washes; elevation less than 3,937 feet.	No	Not expected to occur	The Project site and adjacent areas lack suitable sandy washes or rocky slopes to support this species. In addition, this is a shrub, and surveys were conducted during its typical blooming period. Therefore, this species likely would have been detected if present.

Attachment 4					
Sensitive Plant Species Observed or with the Potential for Occurrence					
Scientific Name Common Name	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
<b>POLEMONIACEAE PHLOX FAMILY</b>					
<i>Ipomopsis effusa</i> Baja California ipomopsis	2B.1	Annual herb; alluvial fans; blooms April; elevation less than 330 feet.	No	Not expected to occur	This species has been reported within two miles of the Project site (CDFW 2019a). However, the Project site and adjacent areas lack suitable desert washes to support this species. In addition, surveys were conducted at an appropriate time of year to detect this species if present.
<i>Ipomopsis tenuifolia</i> slender-leaved ipomopsis	2B.3	Perennial herb; blooms March–May; creosote bush scrub; gravelly to rocky slopes and canyons; elevation 328–3,937 feet.	No	Not expected to occur	The Project site and adjacent areas lack suitable rocky slopes to support this species. In addition, this is a perennial species, and surveys were conducted during its typical blooming period. Therefore, this species likely would have been detected if present.
<b>POLYGONACEAE BUCKWHEAT FAMILY</b>					
<i>Nemacaulis denudata</i> var. <i>gracilis</i> slender cotttonheads	2B.2	Annual herb; coastal and desert dunes, Sonoran desert scrub; blooms March–May; elevation 170–1,300 feet.	No	Low potential to occur	The sandy soils in the western portion, along the edges of, and adjacent to the Project area south of Westside Main Canal are superficially suitable, although historical agriculture on site likely extirpated any populations present. The nearest likely extant record of this species is in the Jacumba wilderness Area, 13 miles to the southwest (University of California 2019).
<b>RHAMNACEAE BUCKTHORN FAMILY</b>					
<i>Colubrina californica</i> Las Animas colubrina	2B.3	Shrub; blooms April–May; creosote bush scrub; elevation less than 3,281 feet.	No	Not expected to occur	This is a shrub, and surveys were conducted during its typical blooming period. Therefore, this species likely would have been detected if present.

Attachment 4					
Sensitive Plant Species Observed or with the Potential for Occurrence					
Scientific Name Common Name	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
<i>Condalia globosa</i> var. <i>pubescens</i> spiny abrojo	4.2	Shrub; blooms March–April; creosote bush scrub; elevation less than 3,281 feet.	No	Not expected to occur	This is a shrub, and surveys were conducted during its typical blooming period. Therefore, this species likely would have been detected if present.
<b>SIMAROUBACEAE QUASSIA FAMILY</b>					
<i>Castela emoryi</i> Emory's crucifixion-thorn	2B.2	Shrub; dry, gravelly washes, slopes, and plains in desert; blooms June–July; elevation 2,150 feet.	No	Not expected to occur	As this is a conspicuous shrub, this species likely would have been detected if present.
<b>SOLANACEAE NIGHTSHADE FAMILY</b>					
<i>Lycium parishii</i> Parish's desert-thorn	2B.3	Perennial shrub; coastal sage scrub, Sonoran desert scrub; blooms March–April; elevation 1,000–3,300 feet.	No	Not expected to occur	This species has been reported within two miles of the Project site (CDFW 2019a). However, this is a shrub, and surveys were conducted during its typical blooming period. Therefore, this species likely would have been detected if present.
<b>ANGIOSPERMS: MONOCOTS</b>					
<b>POACEAE GRASS FAMILY</b>					
<i>Imperata brevifolia</i> California satintail	2B.1	Perennial grass; blooms September–May; creosote bush scrub; elevation less than 1,640 feet.	No	Not expected to occur	This is a perennial species, and surveys were conducted during its typical blooming period. Therefore, this species likely would have been detected if present.

Attachment 4					
Sensitive Plant Species Observed or with the Potential for Occurrence					
Scientific Name Common Name	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
<b>STATUS CODES</b> FE = Federally listed endangered FT = Federally listed threatened CE = State listed endangered CR = State listed rare BLM = Bureau of Land Management sensitive species  <b>CALIFORNIA NATIVE PLANT SOCIETY (CNPS): CALIFORNIA RARE PLANT RANKS (CRPR)</b> 1B = Species rare, threatened, or endangered in California and elsewhere. These species are eligible for state listing. 2B = Species rare, threatened, or endangered in California but more common elsewhere. These species are eligible for state listing. 3 = Species for which more information is needed. Distribution, endangerment, and/or taxonomic information is needed. 4 = A watch list of species of limited distribution. These species need to be monitored for changes in the status of their populations. .1 = Species seriously threatened in California (over 80% of occurrences threatened; high degree and immediacy of threat). .2 = Species fairly threatened in California (20-80% occurrences threatened; moderate degree and immediacy of threat). .3 = Species not very threatened in California (<20% of occurrences threatened; low degree and immediacy of threat or no current threats known).

### **Sensitive Wildlife Species Occurring or with the Potential to Occur**

**Attachment 5**  
**Sensitive Wildlife Species Occurring or with the Potential to Occur**

Common Name <i>Scientific Name</i>	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
<b>FISHES</b> (Nomenclature from Page et al. 2013)					
<b>CYPRINODONTIDAE      PUPFISH</b>					
Desert pupfish <i>Cyprinodon macularius</i>	FE, CE	Desert pools and streams.	No	Not expected to occur	The Project site lacks natural desert pools or streams to support the species.
<b>CYPRINIDAE      MINNOWS</b>					
Bonytail chub <i>Gila elegans</i>	FE, CE	Swift, muddy rivers.	No	Not expected to occur	The Project site lacks a natural river to support the species.
<b>CATOSTOMIDAE      SUCKER</b>					
Humpback (=razorback) sucker <i>Xyrauchen texanus</i>	FE, CE, CFP	Warm tributaries, shallow water, gravelly-bottom rivers.	No	Not expected to occur	The Project site lacks natural streams or rivers to support the species.
<b>REPTILES</b> (Nomenclature from Crother et al. 2012)					
<b>TESTUDINIDAE      GOPHER TORTOISES</b>					
Desert tortoise <i>Gopherus agassizii</i>	FT, CT	Mohave and Sonoran desert areas, especially areas of creosote bush scrub.	No	Not expected to occur	The Project site is outside this species' known range (SDNHM 2019). No desert tortoise burrows or other sign was observed.
<b>GEKKONIDAE      GECKOS</b>					
Switak's banded gecko <i>Coleonyx switaki</i>	CT, BLM	Rock outcrops on arid hillsides and canyons in desert scrub vegetation types.	No	Low	The Project site and surrounding area lack suitable rock outcrops and/or hillsides.

**Attachment 5**  
**Sensitive Wildlife Species Occurring or with the Potential to Occur**

Common Name <i>Scientific Name</i>	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
<b>IGUANIDAE                      IGUANID LIZARDS</b>					
Flat-tailed horned lizard <i>Phrynosoma mcalli</i>	SSC, BLM	Dunes and sandy flats of low desert.	Horned lizard tracks observed	Assumed present	This species has been reported repeatedly in the undeveloped desert areas immediately west and south of the Project site (CDFW 2019a). Horned lizard tracks were observed in the western portion of the Project site, south of Westside Main Canal, and the western and southwestern portions of the Project site provide suitable habitat.
Colorado Desert fringe-toed lizard <i>Uma notata</i>	SSC, BLM	Loose sand of desert dunes, flats, riverbanks, and washes. Prefers scant vegetation.	No	Moderate	This species has been reported within two miles of the Project site (CDFW 2019a). The desert scrub communities and loose sand in the western portion of the Project site, south of Westside Main Canal, provide suitable habitat.
<b>BIRDS</b> (Nomenclature from Chesser et al. 2018)					
<b>PELECANIDAE                      PELICANS</b>					
American white pelican (nesting colony) <i>Pelecanus erythrorhynchos</i>	SSC	Lagoons, bays, estuaries, freshwater ponds; inland lakes during spring migration. Migrant and winter visitor.	Observed flying overhead	Not expected to forage or nest on site	This species is a winter visitor to southern California. The Project site lacks suitable pond or lake habitat for foraging.

**Attachment 5**  
**Sensitive Wildlife Species Occurring or with the Potential to Occur**

Common Name <i>Scientific Name</i>	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
<b>PHALACROCORACIDAE CORMORANTS</b>					
Double-crested cormorant (nesting colony) <i>Phalacrocorax auritus albociliatus</i>	WL	Bays, lagoons, estuaries. Non-breeding year-round visitor.	Observed flying overhead	Low potential to forage; not expected to nest	The Westside Main Canal may provide foraging opportunities. However, the Project site and surrounding area lack suitable nesting habitat isolated from predators and human disturbance.
<b>ARDEIDAE HERONS &amp; BITTERNS</b>					
Great egret (nesting colony) <i>Ardea alba</i>	*	Lagoons, bays, estuaries. Ponds and lakes in the coastal lowland. Winter visitor, uncommon in summer.	Observed flying overhead	Moderate potential to forage; not expected to nest	The Westside Main Canal and adjacent active and fallow agricultural fields may provide foraging opportunities. However, the Project site and surrounding area lack suitable nesting habitat, i.e., trees adjacent to pond, lake, or lagoon and isolated from human activity.
Great blue heron (nesting colony) <i>Ardea herodias</i>	*	Bays, lagoons, ponds, lakes. Non-breeding year-round visitor, some localized breeding.	Observed flying overhead	Moderate potential to forage; not expected to nest	The Westside Main Canal and adjacent active and fallow agricultural fields may provide foraging opportunities. However, the Project site and surrounding area lack suitable nesting habitat, i.e., trees adjacent to pond, lake, or lagoon and isolated from human activity.

**Attachment 5**  
**Sensitive Wildlife Species Occurring or with the Potential to Occur**

Common Name <i>Scientific Name</i>	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
Snowy egret (nesting colony) <i>Egretta thula</i>	*	Coastal waters and freshwater ponds and lakes. Winter visitor, summer resident. Localized breeding colonies.	Observed flying overhead and in adjacent active agricultural fields	High potential to forage; not expected to nest	The Westside Main Canal and adjacent active and fallow agricultural fields provide foraging opportunities. However, the Project site and surrounding area lack suitable nesting habitat, i.e., marsh and/or trees adjacent to pond, lake, or lagoon.
Least bittern (nesting) <i>Ixobrychus exilis</i>	SSC	Brackish and freshwater marshes in the coastal lowland. Rare summer resident, rare in winter.	No	Moderate potential to forage; not expected to nest	The wetland vegetation along the Westside Main Canal and irrigation ditches may provide suitable foraging habitat. However, the Project site and surrounding area lack sufficiently large and/or dense stands of emergent wetland vegetation to provide suitable nesting habitat.

**Attachment 5**  
**Sensitive Wildlife Species Occurring or with the Potential to Occur**

Common Name <i>Scientific Name</i>	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
Black-crowned night heron (nesting colony) <i>Nycticorax nycticorax</i>	*	Lagoons, estuaries, bayshores, ponds, and lakes. Often roost in trees. Year-round visitor. Localized breeding.	Observed in common reed marsh	Present; not expected to nest	The wetland vegetation along the Westside Main Canal and irrigation ditches, as well as the active agricultural fields provide suitable foraging habitat. However, the Project site and surrounding area lack suitable nesting habitat, i.e., marsh and/or trees adjacent to pond, lake, or lagoon and isolated from predators and human activity.
<b>ACCIPITRIDAE                      HAWKS, KITES, &amp; EAGLES</b>					
Cooper's hawk (nesting) <i>Accipiter cooperii</i>	WL	Mature forest, open woodlands, wood edges, river groves. Parks and residential areas.	Observed flying overhead and in arrow weed thickets east of Project site in the months of April, November, December, and January	High potential to forage; not expected to nest	The Project site and surrounding areas provide suitable, open foraging habitat. The eucalyptus trees in the northern portion and tamarisk trees in the southern portion of the Project site provide potentially suitable nest sites. However, the Project site is outside this species' typical breeding range. The dates of observations of this species (i.e., lack of observations throughout the breeding season) on-site suggest the observed individual(s) is/are winter visitor(s).

**Attachment 5**  
**Sensitive Wildlife Species Occurring or with the Potential to Occur**

Common Name <i>Scientific Name</i>	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
Golden eagle (nesting and wintering) <i>Aquila chrysaetos</i>	WL, CFP, BLM	Require vast foraging areas in grassland, broken chaparral, or sage scrub. Nest in cliffs and boulders. Uncommon resident.	No	Low potential to forage; not expected to nest	The Project site and surrounding areas provide suitable, open foraging habitat; however the nearest suitable cliffs are located approximately 15 miles to the west. No suitable habitat for nesting is present.
Ferruginous hawk (wintering) <i>Buteo regalis</i>	WL	Require large foraging areas. Grasslands, agricultural fields. Uncommon winter resident.	Observed flying overhead in the months of December and January	High potential to forage; not expected to nest	The Project site and surrounding areas provide suitable, open foraging habitat with common prey items (e.g., cottontail, jackrabbit, ground squirrel). The eucalyptus trees within the northern Project site and utility towers within and adjacent to the Project site may provide suitable nest sites. However, the Project site is outside this species' known breeding range.

**Attachment 5**  
**Sensitive Wildlife Species Occurring or with the Potential to Occur**

Common Name <i>Scientific Name</i>	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
Northern harrier (nesting) <i>Circus hudsonius</i>	SSC	Coastal lowland, marshes, grassland, agricultural fields. Migrant and winter resident, rare summer resident.	Observed flying overhead and foraging in arrow weed and tamarisk thickets in April, early May, October, and November	High potential to forage; not expected to nest	The Project site and surrounding areas provide suitable, open foraging habitat with common prey items (e.g., small mammals, lizards, birds). However, this species is typically only a winter visitor to the desert; the Project site is outside this species' known breeding range. The dates of observations of this species (i.e., lack of observations throughout the breeding season) on-site also suggest the observed individual(s) is/are winter visitor(s).
Bald eagle (nesting and wintering) <i>Haliaeetus leucocephalus</i>	(Fed. Delisted), CE, CFP, BLM	Rivers, lakes. Rare winter visitor, rare fall migrant. Feed mainly on fish.	No	Not expected to occur	The Project site and surrounding areas lacks suitable nesting and foraging habitat (i.e., large trees or cliff faces adjacent to a large body of water).

**Attachment 5**  
**Sensitive Wildlife Species Occurring or with the Potential to Occur**

Common Name <i>Scientific Name</i>	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
<b>FALCONIDAE                      FALCONS &amp; CARACARAS</b>					
Prairie falcon (nesting) <i>Falco mexicanus</i>	WL	Grassland, agricultural fields, desert scrub. Uncommon winter resident. Rare breeding resident.	Observed flying overhead and in adjacent active agricultural field in early July, early October, and mid-December	High potential to forage; low potential to nest	The Project site and surrounding areas provide suitable open desert habitat and agricultural fields for foraging. The Project site and surrounding areas lack suitable cliff faces or bluffs preferred for nesting; however, the utility towers that occur within and adjacent to the west side of the Project site may provide nesting opportunities.
<b>RALLIDAE                      RAILS, GALLINULES, &amp; COOTS</b>					
California black rail <i>Laterallus jamaicensis coturniculus</i>	CT, CFP, BLM	Tidal marshes, grassy marshes. Known occurrences very limited in California, with the closest in the Salton Sea area and lower Colorado River valley.	No	Not expected to occur	The Project site and surrounding areas lack wetland habitat of sufficient size and/or suitable plant species composition to support this species.
Yuma Ridgway's rail <i>Rallus obsoletus</i> [=longirostris] <i>yumanensis</i>	FE, CT, CFP	Marshland vegetation, dense cattail stands, bulrush, reeds. Resident.	No	Not expected to occur	This species has been reported within two miles of the Project site (CDFW 2019a). However, the Project site and surrounding areas lack suitable, undisturbed marsh habitat with calm and shallow (three to eight inches deep) water.

**Attachment 5**  
**Sensitive Wildlife Species Occurring or with the Potential to Occur**

Common Name <i>Scientific Name</i>	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
<b>GRUIDAE                      CRANES</b>					
Greater sandhill crane (nesting and wintering) <i>Antigone canadensis tabida</i>	CT, CFP, BLM	Nest marshes, bogs, or meadows, and prairies. Outside breeding season, occupy shallow lakes or rivers by night and irrigated croplands, pastures, grasslands, or wetlands by day.	No	Low potential to forage; not expected to nest	The fallow agricultural fields on site are largely unsuitable as long-term wintering habitat due to lack of irrigation. This species may occasionally visit the marshy areas along the Westside Main Canal during migration. However, the Project site is outside this species' known breeding range.
<b>CHARADRIIDAE                      LAPWINGS &amp; PLOVERS</b>					
Western snowy plover (nesting) <i>Charadrius alexandrinus nivosus</i>	FT, SSC	Sandy beaches; lagoon margins; tidal mud flats; barren to sparsely vegetated alkaline or saline lakes, reservoirs, or ponds; riverine sand bars. Migrant and winter resident. Localized breeding.	No	Not expected to occur	The Project site and surrounding areas lack suitable open ground adjacent to an alkaline body of water or agricultural waste-water pond, or riverine sand bars. The closest known breeding population occurs at Salton Sea.

**Attachment 5**  
**Sensitive Wildlife Species Occurring or with the Potential to Occur**

Common Name <i>Scientific Name</i>	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
Mountain plover (wintering) <i>Charadrius montanus</i>	SSC, BLM	Grasslands, fields, valleys, grazed pastures, alkaline flats, fallow and/or tilled fields. Localized winter resident.	No	Low potential to forage on-site.	This species has been reported within two miles of the Project site (CDFW 2019a, Heritage Environmental Consultants 2012f). The active agricultural fields northeast of the Project site may provide more suitable wintering/foraging habitat, depending on crop rotation and status.
<b>SCOLOPACIDAE                      SANDPIPERS &amp; PHALAROPES</b>					
Long-billed curlew (nesting) <i>Numenius americanus</i>	WL	Breeds in northern North America in tidal mud flats, salt marshes, bays. Migrates to the coast for wintering. Fall and spring migrant through Project area.	Observed flying overhead	Not expected to nest or forage on-site.	No suitable breeding habitat is present on site. The active agricultural fields northeast of the Project site provide suitable foraging habitat during migration; however, no suitable habitat is present on site.
<b>LARIDAE                              GULLS, TERNS, &amp; SKIMMERS</b>					
Laughing gull (nesting colony) <i>Larus atricilla</i>	WL	Year-round resident on beaches and coastal areas of the Gulf of California. Common post-breeding visitor and occasional breeding species at Salton Sea.	No	Low potential to forage; not expected to nest	Agricultural fields northeast of the Project site may provide suitable foraging grounds during migration. However, the Project site and surrounding areas lacks suitable marsh or sandy flats adjacent to a large body of water for nesting.

**Attachment 5**  
**Sensitive Wildlife Species Occurring or with the Potential to Occur**

Common Name <i>Scientific Name</i>	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
<b>CUCULIDAE                      CUCKOOS &amp; ROADRUNNERS</b>					
Western yellow-billed cuckoo (nesting) <i>Coccyzus americanus occidentalis</i>	FT, CE, BLM	Riparian woodlands. Summer resident. Very localized breeding.	No	Not expected to occur	The Project site and surrounding areas lack suitable mature riparian forest.
<b>STRIGIDAE                      TYPICAL OWLS</b>					
Long-eared owl (nesting) <i>Asio otus</i>	SSC	Roost in dense riparian woodland, oak woodland, tamarisk woodland. Forages over grasslands and open shrublands. Rare resident and winter visitor.	No	Low potential to forage and nest	The open vegetation within and adjacent to the Project site provides suitable foraging grounds, and the tamarisk thickets may provide marginally suitable roosting habitat, but breeding not expected.
Burrowing owl (burrow sites and some wintering sites) <i>Athene cunicularia</i>	SSC, BLM	Grassland, agricultural land, coastal dunes. Require rodent burrows. Declining resident.	Observed in fourwing saltbush scrub and upland mustards in Project site and in creosote bush scrub west of Project site	Present as non-breeding winter visitor; high potential to occur/nest during breeding season	A minimum of two individuals were observed within the western and southern portions of the Project site during 2018-2019 non-breeding season surveys. This species was also observed in the active agricultural fields within one mile northeast of the Project site during 2018 breeding season surveys and has been reported within two miles of the Project site (CDFW 2019a).

**Attachment 5**  
**Sensitive Wildlife Species Occurring or with the Potential to Occur**

Common Name <i>Scientific Name</i>	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
<b>APODIDAE                      SWIFTS</b>					
Vaux's swift (nesting) <i>Chaetura vauxi</i>	SSC	All habitat types during summer and winter migration. Breeds in coniferous forests of the central and northern California ranges.	Observed flying overhead	Low potential to forage; not expected to nest	Habitat on site is only marginally suitable for foraging during migration; however nearby agricultural fields provide better foraging opportunity. Project site is outside breeding range of this species.
<b>TYRANNIDAE                      TYRANT FLYCATCHERS</b>					
Southwestern willow flycatcher (nesting) <i>Empidonax traillii extimus</i>	FE, CE	Nesting restricted to willow thickets. Also occupies other woodlands. Rare spring and fall migrant, rare summer resident. Extremely localized breeding.	No	Moderate potential to forage; not expected to nest	The arrow weed and tamarisk thickets within and adjacent to the Project site may provide suitable foraging habitat during migration. However, the Project site and surrounding areas lack suitable mature riparian habitat for breeding.

**Attachment 5**  
**Sensitive Wildlife Species Occurring or with the Potential to Occur**

Common Name <i>Scientific Name</i>	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
Vermilion flycatcher (nesting) <i>Pyrocephalus rubinus</i>	SSC	Desert scrub habitats, agricultural areas, parks, ponds, rivers. Rare breeder in Imperial County.	No	Moderate potential to forage; low potential to nest	This species was observed approximately two miles northeast of the Project site, as reported by a security guard working at the solar field north of the Project site. A photograph was shown to the surveying biologists during the January 24, 2019, burrowing owl survey. The natural vegetation communities and agricultural fields within and adjacent to the Project site provide suitable foraging habitat during migration. The arrow weed and tamarisk thickets provide marginally suitable nesting habitat; however breeding is rare in the region.
<b>LANIIDAE                      SHRIKES</b>					
Loggerhead shrike (nesting) <i>Lanius ludovicianus</i>	SSC	Open foraging areas near scattered bushes and low trees.	Observed in tamarisk thickets on Project site and in common reed marsh and creosote bush scrub immediately adjacent to Project site	Present, likely resident; high potential to nest	This species was repeatedly observed during the biological surveys. With the combination of dense patches of shrubs or trees and adjacent open areas, the Project site and surrounding areas provide suitable breeding habitat for this species.

**Attachment 5**  
**Sensitive Wildlife Species Occurring or with the Potential to Occur**

Common Name <i>Scientific Name</i>	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
<b>VIREONIDAE                      VIREOS</b>					
Least Bell's vireo (nesting) <i>Vireo bellii pusillus</i>	FE, CE	Willow riparian woodlands. Summer resident.	No	Low potential to forage; not expected to nest	The arrow weed and tamarisk thickets within and adjacent to the Project site may provide somewhat suitable foraging habitat during migration. However, the Project site and surrounding areas lack suitable mature riparian habitat for breeding.
<b>POLIOPTILIDAE                      GNATCATCHERS</b>					
Black-tailed gnatcatcher <i>Polioptila melanura</i>	WL	Semi-arid and desert scrub communities including creosote bush, salt bush, mesquite, and cacti. Known to use willows and tamarisk along Colorado River.	Observed in arrow weed thickets and creosote bush scrub along the Project site boundaries south of Westside Main Canal	Present, likely resident; high potential to nest on and adjacent to Project site	This species was repeatedly observed during the biological surveys. The arrow weed thickets, fourwing saltbush scrub, tamarisk thickets, and creosote bush scrub within and adjacent to the Project site provide suitable habitat for this species.

**Attachment 5**  
**Sensitive Wildlife Species Occurring or with the Potential to Occur**

Common Name <i>Scientific Name</i>	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
<b>MIMIDAE                      MOCKINGBIRDS &amp; THRASHERS</b>					
Crissal thrasher <i>Toxostoma crissale</i>	SSC	Mesquite thickets, desert washes with trees and dense shrubs. Rare resident.	No	Low potential to forage or nest	The arrow weed and tamarisk thickets provide marginally suitable nesting habitat. For nesting, this species prefers dense thorny shrubs, which are scattered within the Project site and surrounding area. This species is also sensitive to human disturbance.
LeConte's thrasher <i>Toxostoma lecontei</i>	SSC	Desert washes, creosote bush scrub. Uncommon resident.	Observed in arrow weed thickets and fourwing saltbush scrub on Project site	Present, likely resident; low potential to nest within Project site	Although this species as observed and is likely a resident in the native desert scrub communities within and adjacent to the Project site, it is unlikely to nest on the Project site due to the lack of cactus and low number of thorny shrubs.
<b>PASSERELLIDAE                      SPARROWS</b>					
Abert's towhee <i>Melospiza aberti</i>	*	Desert scrub in Sonoran and Colorado deserts.	Observed as a common species in arrow weed thickets, fourwing saltbush scrub, and creosote bush scrub on and adjacent to Project site	Present, likely resident; high potential to nest on and adjacent to Project site	This species was repeatedly observed during the biological surveys. The arrow weed thickets, fourwing saltbush scrub, tamarisk thickets, and creosote bush scrub within and adjacent to the Project site provide suitable habitat for this species.

**Attachment 5**  
**Sensitive Wildlife Species Occurring or with the Potential to Occur**

Common Name <i>Scientific Name</i>	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
Brewer's sparrow (nesting) <i>Spizella breweri</i>	*	Big sagebrush scrub, occasionally open pinyon- juniper woodlands.	Observed once on Project site in April 2018	Observed foraging on site during winter; not expected to nest	The scrub communities within and adjacent to the Project site provide suitable foraging habitat during migration. The Project site is outside this species' known breeding range.
<b>ICTERIDAE                      YELLOW-BREASTED CHATS</b>					
Yellow-breasted chat (nesting) <i>Icteria virens auricollis</i>	SSC	Dense riparian woodland. Localized summer resident.	No	Low potential to forage; not expected to nest	The arrow weed and tamarisk thickets within and adjacent to the Project site may provide marginally suitable foraging habitat during migration. However, the Project site and surrounding areas lack suitable mature riparian habitat for breeding.
<b>ICTERIDAE                      BLACKBIRDS &amp; NEW WORLD ORIOLES</b>					
Yellow-headed blackbird (nesting) <i>Xanthocephalus xanthocephalus</i>	SSC	Breeds within deeply flooded freshwater marshes, ponds.	Observed in common reed marshes along Westside Main Canal, along Project site boundary	Occasional visitor during migration; not expected to nest	The marsh vegetation within and adjacent to the Project site occurs in small and/or narrow patches and is not associated with a large water body such as a lake or pond. Therefore, the marsh is likely unsuitable as breeding habitat for this species.

**Attachment 5**  
**Sensitive Wildlife Species Occurring or with the Potential to Occur**

Common Name <i>Scientific Name</i>	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
<b>PARULIDAE                      WOOD-WARBLEDERS</b>					
Yellow warbler (nesting) <i>Setophaga [=Dendroica] petechia</i>	SSC	Breeding restricted to riparian woodland. Spring and fall migrant, localized summer resident, rare winter visitor.	Observed in tamarisk thickets on Project site in April 2018	Occasional visitor during migration; not expected to nest	The arrow weed and tamarisk thickets within and adjacent to the Project site provide suitable foraging habitat during migration. However, the Project site and surrounding areas lack suitable mature riparian habitat for breeding.
<b>MAMMALS</b> (Nomenclature from Baker et al. 2003)					
<b>PHYLLOSTOMIDAE                      NEW WORLD LEAF-NOSED BATS</b>					
California leaf-nosed bat <i>Macrotus californicus</i>	SSC, BLM	Occurs in deserts of California, southern Nevada, Arizona and south into Baja California and Sonora, Mexico. Roosts in long caves and mine tunnels that maintain relatively warm temperatures and high humidity throughout the year. Forages by gleaning large arthropods within desert washes up to 6 miles of roost.	No	Low potential to forage; not expected to roost	The fallow agricultural fields, arrow weed and tamarisk thickets, and marshes along the Westside Main Canal provide potentially suitable foraging habitat; however . the Project site lacks suitable roost sites, and few roosting opportunities are expected within 6 miles.

**Attachment 5**  
**Sensitive Wildlife Species Occurring or with the Potential to Occur**

Common Name <i>Scientific Name</i>	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
<b>VESPERTILIONIDAE      VESPER BATS</b>					
Pallid bat <i>Antrozous pallidus</i>	SSC, BLM	Arid deserts and grasslands below 6,000 feet. Roosts in shallow caves, crevices, rock outcrops, buildings, tree cavities. Especially near water. Colonial. Gleans larger arthropods, occasionally lizards and rodents.	No	Moderate potential to forage; low potential to roost	The open desert communities within and adjacent to the Project site provide suitable foraging habitat. The tall eucalyptus, tamarisk, and palm trees within and adjacent to the Project site may provide suitable roost sites.
Townsend's big-eared bat <i>Corynorhinus townsendii</i>	SSC, BLM	Caves, mines, buildings. Found in a variety of habitats, arid and mesic. Individual or colonial. Extremely sensitive to disturbance.	No	Low potential to forage; not expected to roost	The shrub- and tree-dominated vegetation communities within and adjacent to the Project site provide potentially suitable foraging habitat. The Project site lacks suitable roost sites.
<b>MOLOSSIDAE      FREE-TAILED BATS</b>					
Western mastiff bat <i>Eumops perotis californicus</i>	SSC, BLM	Desert scrub, chaparral, oak woodland, ponderosa pine and mixed conifer forests, and meadows. Strongly tied to areas with cliffs and other significant rock features for roosting. Forages over a wide variety of habitats up to 15 miles from the roost.	No	Not expected to forage or roost	The Project site lacks suitable roost sites. The nearest suitable roosting opportunities are likely in the Mountain Springs area 15-20 miles west of the Project site. Project site likely too far from roosting sites to be suitable for foraging. ..

**Attachment 5**  
**Sensitive Wildlife Species Occurring or with the Potential to Occur**

Common Name <i>Scientific Name</i>	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
Big free-tailed bat <i>Nyctinomops macrotis</i>	SSC	Rugged, rocky terrain, in desert scrub, woodland, and evergreen forests. Roosts most common in rock crevices in cliffs, but have also been found in buildings, caves, and tree cavities. Forages almost entirely on large moths.	No	Low potential to forage; not expected to roost	The Project site lacks suitable roost sites. The nearest suitable roosting opportunities are likely in the Mountain Springs area 15-20 miles west of the Project site. While this species is known to travel substantial distances to forage, the potential foraging habitat on site is low quality, and better opportunities are present in active agricultural fields nearby.
<b>HETEROMYIDAE      POCKET MICE &amp; KANGAROO RATS</b>					
Palm Springs little pocket mouse <i>Perognathus longimembris bangsi</i>	SSC, BLM	Desert riparian, desert scrub, desert wash, coastal sage scrub, and sagebrush with sandy soil. Also found on gravel washes and stony soils.	No	Low	The extent of this species' range is not well defined but does extend into the western portion of Imperial Valley. This species tends to prefer denser herbaceous cover than that found within the open desert communities within the Project site and surrounding areas.

**Attachment 5**  
**Sensitive Wildlife Species Occurring or with the Potential to Occur**

Common Name <i>Scientific Name</i>	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
<b>CRICETIDAE                      HAMSTERS, VOLES, LEMMINGS, &amp; NEW WORLD RATS AND MICE</b>					
San Diego desert woodrat <i>Neotoma lepida intermedia</i>	SSC	Coastal sage scrub, chaparral, desert scrub; typically associated with rock outcrops, cacti, or dense undergrowth.	No	Low	The desert communities within and adjacent to the Project site may provide suitable habitat. However, the Project site lacks cactus and rock outcrops, and no woodrat middens were observed within the Project site.
Yuma hispid cotton rat <i>Sigmodon hispidus eremicus</i>	SSC	Cattail marshes along the Colorado River.	No	Moderate	This species has been reported along the Westside Main Canal within two miles of the Project site (CDFW 2019a). The combination of wetland communities along Westside Main Canal, dense herbaceous cover within the fallow agriculture areas, and active agriculture within and adjacent to the Project site provides moderately suitable habitat conditions for this species.

**Attachment 5**  
**Sensitive Wildlife Species Occurring or with the Potential to Occur**

Common Name <i>Scientific Name</i>	Sensitivity Status	Habitat Preference/ Requirements	Detected On Site?	Potential to Occur On Site	Basis for Determination of Occurrence Potential
<b>MUSTELIDAE                      WEASELS, OTTERS, &amp; BADGERS</b>					
American badger <i>Taxidea taxus</i>	SSC	Grasslands, Sonoran desert scrub.	Observed in creosote bush scrub immediately south of Project site; tracks observed in fourwing saltbush scrub on Project site	Present	This species was observed south of the Project site, and tracks were observed in the western and southwestern portions of the Project site. The desert communities within and adjacent to the Project site provide suitable foraging habitat. Suitably- sized burrows were observed immediately adjacent to the southwestern edge of the Project site.
<b>BOVIDAE                      CATTLE, ANTELOPE, GOATS, &amp; SHEEP</b>

## **E.2. Results of 2018 Burrowing Owl Habitat Assessment and Breeding Season Surveys for the Westside Canal Energy Center Project**

*An Employee-Owned Company*

August 3, 2018

Ms. Marilyn Teague  
Sempra Infrastructure, LLC  
HQ-12N1  
488 8th Avenue  
San Diego, CA 92101

Reference: Results of 2018 Burrowing Owl Habitat Assessment and Breeding Season Surveys for the Westside Canal Energy Center Project (RECON Number 8888)

Dear Ms. Teague:

This letter summarizes the results of the 2018 habitat assessment and breeding season surveys for western burrowing owl (*Athene cunicularia hypugaea*) conducted for Sempra Renewables, LLC's Westside Canal Energy Center Project (project). Project location, burrowing owl species and historical occurrence information, habitat assessment and survey methods, and results are discussed in detail below. Survey results will be used to assess potential project impacts and identify appropriate avoidance, minimization, and/or mitigation measures. Burrowing owl was not detected within the project survey area during 2018 breeding season surveys.

### **Project Location and Description**

The project site is located in an unincorporated area of southwestern Imperial County, approximately 4.5 miles south-southwest of Seeley, California (Figure 1). The main project area includes Assessor's Parcel Numbers (APNs) 051-350-010 and 051-350-011. Additional project components, including access routes and staging areas, include portions of adjacent APNs 051-350-019 and 051-350-018. All project components are located in the southern half of Section 34, Township 16 South, Range 12 East, on the U.S. Geological Survey (USGS) Mount Signal, California quadrangle (USGS 1976; Figure 2).

The project is currently in the design phase and includes development, construction, and operation of a hybrid renewable energy facility, consisting of a solar photovoltaic plus Battery Energy Storage generating plant and an Energy Storage System. The project will also include construction of a new loop-in substation on-site, as well as construction of an access road and bridge to provide vehicular access from Liebert Road and across the Westside Canal (Figure 3). Construction and project details, such as proposed timeline, daily work schedules, equipment to be used, activities, and phasing, are not yet finalized. The project boundary shown on Figures 2, 3, and 4 is the preliminary project footprint and includes the currently anticipated permanent and temporary impacts. The estimated in-service date for the project is December 2020.

### **Western Burrowing Owl Species Description**

Burrowing owl is a California Department of Fish and Wildlife (CDFW) species of special concern. Western burrowing owl, the western subspecies, is primarily restricted to the western United States and Mexico. Studies conducted by Ruhlen et al. (2004) show that the density and abundance of this species within the Imperial Valley is exceptionally high compared to other areas in southern California.

FIGURE 4  
2018 Burrowing Owl Habitat  
Assessment and Breeding  
Season Survey Results

Habitat for the western burrowing owl includes dry, open, low-growing grasslands, deserts, and scrublands with level to gently sloping topography and well-drained soils (CDFW 2012). These areas are also often associated with burrowing mammals (Haug et al. 1993). Irrigation canals, ditches, and drains immediately adjacent to agricultural fields are also commonly used as nesting sites (Ruhlen et al. 2004). Western burrowing owl is known to use multiple burrows in addition to their nesting burrows called “satellite” burrows. These non-nesting burrows are used to seek protection from predators and for roosting during the non-breeding season (CDFW 2012).

Western burrowing owl is diurnal and typically perches during daylight at the entrance to its burrow or on adjacent structures, such as low posts. Nesting typically occurs from March through August. Western burrowing owl breeding pairs form a bond for more than one year and exhibit high site fidelity, reusing the same burrow year after year (Haug et al. 1993). The female remains inside the burrow during most of the egg laying and incubation period and is fed by the male throughout brooding. Western burrowing owl is an opportunistic feeder, consuming a diet that includes arthropods, small mammals, and birds, and occasionally amphibians and reptiles (Haug et al. 1993).

Urbanization has greatly reduced the amount of suitable habitat for the western burrowing owl. Other contributions to the decline of this species include the poisoning of fossorial mammals, road and ditch maintenance, and collisions with automobiles (CDFW 2012).

## **Methods**

For the purposes of this report, the “survey area” includes the project area and the surrounding 150 meters (see Figures 2 through 4). As land owners had not granted permission to access adjacent properties, direct access was limited to the project area south of Westside Canal (land owned by Sempra Energy), the canal roads (including Mandrapa Road), and Liebert Road. Therefore, the project area south of Westside Canal, totaling approximately 148 acres, was surveyed using line transects with surveyors spaced 150 to 230 feet apart, with low to very low vegetation density and cover allowing for excellent ground visibility. The majority of the survey area north of Westside Canal and the entirety of the 150-meter buffer south of Westside Canal, totaling approximately 180 acres, were surveyed by using binoculars or scopes. These areas were surveyed by conducting 15-minute point count surveys along the roads north of Westside Canal and project boundary south of Westside Canal, with spacing dependent on the height and density of the surrounding vegetation.

Methods used for the burrowing owl habitat assessment and breeding season surveys follow the guidelines set forth by CDFW (2012) and are detailed below.

### ***Habitat Assessment Methods***

The habitat assessment began with a review of relevant biological information to provide local and regional context, document known occurrences of the species within the project vicinity, and identify potentially suitable burrowing owl habitat within and adjacent to the project area. This analysis included record searches of the California Natural Diversity Database (CNDDB; CDFW 2018) and eBIRD (<http://ebird.org>). Additional resources reviewed included San Diego County Bird Atlas (Unitt 2004), Proceedings of the California Burrowing Owl Symposium (Barclay et al. 2007), USGS topographic maps (USGS 1976), soils survey maps (USDA 1975), and online aerial satellite imagery (Google Earth Pro 2018).

RECON Environmental, Inc. (RECON) biologists Brenna Ogg, Bernadette Rigley, Alex Fromer, and Brian Parker conducted the habitat assessment on April 5, 2018 (Table 1). The biologists assessed vegetation types, height, and density; land use; presence or absence of friable soils, burrows, and/or burrow complexes; topography; hydrological features; and presence or absence of burrowing owl sign.

Vegetation community classifications in this report follow Sawyer et al. (2009) per the CDFW guidelines. Where Sawyer et al. (2009) does not provide an appropriate classification, the following land cover types were used: developed, active agriculture, fallow agriculture, open water, and disturbed habitat.

Table 1 Survey Information

°F = degrees Fahrenheit; mph = miles per hour; % = percent.				

### ***Breeding Season Survey Methods***

RECON biologists Brenna Ogg, Bernadette Rigley, Sonya Vargas, Kevin Israel, Alex Fromer, Kayo Valenti, Andrew Smisek, and Victor Novik conducted western burrowing owl breeding season surveys in accordance with the guidelines developed by the CDFW (CDFW 2012). Surveys included four visits during the western burrowing owl breeding season. Each survey was conducted by four biologists over a two-day period, between two hours before sunset and civil dusk on the first day and between civil dawn and 10:00 on the second day. Surveys were spaced at least three weeks apart. All wildlife species observed during the surveys were noted, and all suitable burrows were recorded using a handheld Global Positioning System (GPS) device. Survey dates, personnel, times, and weather conditions are provided in Table 1.

### **Results/Existing Conditions**

#### ***Literature Review and Desktop Evaluation Results***

Based on a review of the CNDDDB and eBIRD, the agricultural fields north and east of the project site and the desert areas west of the project site have multiple records of western burrowing owl (CDFW 2018). The closest reported occurrences to the project area are between 3.5 and 4 miles to the southeast and west. One occurrence was within active agriculture, and one was within creosote scrub. Both were reported in 2007 (CDFW 2018).

Based on a review of aerial imagery and the proximity of known occurrences of the species, RECON concluded that the majority of the project area and larger survey area provide potentially suitable burrowing owl habitat. The project area largely comprises land that, although zoned for agriculture, has been inactive since approximately 2013 on the north side of Westside Canal as a result of solar energy development and 2003 or earlier on the south side of Westside Canal. Surrounding areas to the south, west, and east are

mostly undeveloped, and areas to the north include a mix of active agriculture and photovoltaic solar development.

Eight soil series occur within the survey area and are listed in their approximate order of predominance: Vint, Vint and Indio, Meloland, Rositas, Imperial-Glenbar, Indio-Vint, Holtville, and Glenbar complex. These include eleven distinct soil types, which generally comprise very fine to fine sand with varying degrees of loam, silt, and clay components (USDA 1975).

### ***Habitat Assessment Results***

The main project area south of Westside Canal consists of land that was previously used for agriculture but has remained inactive since at least 2003. This has resulted in the natural, wind-driven deposition of sand and re-establishment of native and non-native vegetation within the old agricultural fields. The westernmost and southwestern portions of the main project area currently support the highest cover of native shrub species, while the central and eastern portions mostly support a mix of native and non-native annual plant species.

The project area north of Westside Canal mostly consists of land that was previously used for agriculture but has been inactive for a relatively shorter period (since approximately 2013). Non-native weedy plant species are common in this area, with remnant patches of planted non-native trees.

Overall, areas north of the project area are more developed than those to the south of the project area. The 150-meter buffer area south of Westside Canal consists of mostly undeveloped land, with one transmission line and associated access roads to the west and one wooden shade structure and bare pad (assumed belonging to U.S. Border Patrol) to the east. Imperial Valley Substation lies approximately 1,800 feet to the south, beyond the 150-meter buffer. The 150-meter buffer area north of Westside Canal consists of active agriculture, photovoltaic solar development, and dirt roads. Dirt roads also run immediately adjacent and parallel to the north and south banks of Westside Canal, and one dirt road follows a distribution line south through the main project area.

In general, the survey area contains level topography close to sea level with short earthen berms along the edges of the active and inactive agricultural fields and irrigation canals. Small sandy hummocks occur amongst the native desert vegetation in the 150-meter buffer. The southwestern section of the old agricultural fields in the main project area sits on a slightly higher terrace than the adjacent fields to the north and west, and the elevation increases slightly from there in the southwestern corner of the 150-meter buffer, with small sand hummocks and dunes forming along the leeward side of a human-created berm/access road.

Available water sources observed during the surveys were limited to the northern portion of the survey area and included only human-created sources: Westside Canal and the irrigation ditches, channels, and temporarily ponded areas within the active agriculture fields. All of the concrete-lined irrigation channels south of Westside Canal are dilapidated and/or buried in sand, and have likely not transported water since the agricultural land south of Westside Canal went inactive. The old, unused irrigation channels south of Westside Canal may support temporary ponding during the wet season. However, there was no sign of recent ponding, and the 2017-2018 wet season had well-below average rainfall totals. Furthermore, it appeared that all annual plant stalks observed on-site in upland areas were remaining from the 2016-2017 wet season. No substantial annual growth was observed as a result of 2017-2018 rainfall.

Vegetation communities mapped within the survey area include upland mustards (*Brassica* spp. and Other Mustards Semi-Natural Herbaceous Stands), creosote bush scrub (*Larrea tridentata* Shrubland Alliance), fourwing saltbush scrub (*Atriplex canescens* Shrubland Alliance), quailbush scrub (*Atriplex lentiformis* Shrubland Alliance), arrow weed thickets (*Pluchea sericea* Shrubland Alliance), tamarisk thickets (*Tamarix* spp. Semi-Natural Shrubland Stands), common reed marshes (*Phragmites australis* Herbaceous Alliance and Semi-Natural Stands), eucalyptus groves (*Eucalyptus* spp. Semi-Natural Woodland Stands), and cattail

marshes (*Typha* sp. Herbaceous Alliance) (see Figure 3). Additional land cover types include fallow agriculture, active agriculture, disturbed habitat, developed land, and open water (see Figure 3). Nearly all vegetation communities and land cover types within the survey area provide potentially suitable habitat for western burrowing owl due to the low stature and/or low-density vegetative cover. Areas dominated by annual plant species (e.g., upland mustards) typically support 5 to 25 percent vegetative cover with average plant height less than two feet (Photographs 1 and 2; see Figure 3 for photograph locations). Areas dominated by native upland shrubs (e.g., creosote bush scrub, fourwing saltbush scrub, quailbush scrub) typically support between 25 and 40 percent vegetative cover with shrub height generally less than four feet (Photographs 3 through 6; see Figure 3 for photograph locations). Active agricultural fields generally comprised low-growing or recently cut, irrigated vegetation (Photograph 7; see Figure 3 for photograph location).

Some stands of vegetation within the survey area would not likely provide suitable habitat on their own due to the tall (greater than six feet) height and high (greater than 75 percent cover) density of the vegetation. These include small stands or rows of arrow weed thickets, tamarisk thickets, common reed marshes, eucalyptus groves, and cattail marshes, which occur along the irrigation canals and channels as well as in the eastern 150-meter buffer south of Westside Canal. These also include some stands of creosote bush scrub and quailbush scrub with a higher density and average shrub height in the southern and southeastern 150-meter buffer, as well as in the project area north of Westside Canal. However, as these areas of tall, dense vegetation occur within a larger expanse of open, low-stature habitat, these communities were included in the focused breeding season surveys. Ecotones where the open and dense vegetation meet may provide opportunities for burrow and perch sites (Photograph 8; see Figure 3 for photograph location).

Burrows created by fossorial mammals, as well as concrete pipes associated with the irrigation channels, provide potentially suitable burrows for western burrowing owl throughout much of the survey area (Photographs 9 through 11). Fossorial mammals detected within the survey area include round-tailed ground squirrel (*Spermophilus tereticaudus*), kangaroo rat (*Dipodomys* sp.), kit fox (*Vulpes macrotis*), coyote (*Canis latrans*), and American badger (*Taxidea taxus*). Locations of potentially suitable burrows for western burrowing owl (greater than 11 centimeters in diameter and greater than 150 centimeters in depth) are shown on Figure 4. Only one burrow in the southwestern portion of the survey area had old whitewash near the burrow entrance (see "Suitable Burrow with Sign" on Figure 4 and Photograph 11). No burrowing owls, pellets, feathers, or recent sign was observed during the habitat assessment.

### **Breeding Season Survey Results**

No western burrowing owls were detected within the survey area during 2018 breeding season surveys. As mentioned above, possible burrowing owl sign (i.e., whitewash at the entrance to a burrow) was observed in the southwestern portion of the survey area. However, by the time of the fourth breeding season survey, the entrance to this burrow had been modified and constricted, suggesting recent activity by an animal other than a burrowing owl (Photograph 12), and no new burrowing owl sign was observed at this site.

One western burrowing owl was observed incidentally outside the survey area adjacent to West Wixom Road while driving to the third morning survey. The observation location was approximately 0.75 mile northeast of the survey area at the northern edge of an active agricultural field, with a photovoltaic solar field to the north.

Possible western burrowing owl predators observed during surveys include American badger, coyote, great horned owl (*Bubo virginianus*), Cooper's hawk (*Accipiter cooperii*), red-tailed hawk (*Buteo jamaicensis*), and American crow (*Corvus brachyrhynchos*) (Coulombe 1971, Haug et al. 1993). Of these, coyote, red-tailed hawk, and American crow were the most commonly detected species. Great horned owl is a resident species on site with an active nest observed in the northeastern portion of the survey area. One burrow near the southwestern corner of the survey area also had sign of possible use by American badger. However, no evidence of western burrowing owl predation was observed.

### **Conclusion and Mitigation Requirements**

Western burrowing owl was not detected within the survey area during 2018 breeding season surveys. Therefore, western burrowing owl currently does not appear to be using the survey area as breeding habitat. However, as the project area and larger survey area provide suitable habitat for this species and the species was observed approximately 0.75 mile from the project area, non-breeding season surveys are required to determine if the species uses the survey area as a wintering site, for dispersal, or during migration. These surveys shall follow the guidelines set forth by CDFW (2012) and take place between September 1 and January 31.

Depending on the results of the non-breeding season surveys, formal consultation with CDFW may be required in order to develop an appropriate mitigation plan for the project. One or more mitigation measures, such as avoidance, minimization measures, translocation, artificial burrow construction, burrow exclusion and closure, and/or habitat-based mitigation or preservation, may be required.

At a minimum, regardless of the results of non-breeding season surveys, take-avoidance (pre-construction) surveys for western burrowing owl would be required at least 14 days prior to ground disturbance. This effort would detect any change in western burrowing owl presence within the survey area in order to avoid direct take of owls and inform any necessary take avoidance actions. These surveys would include all areas where suitable habitat is present within the survey area (CDFW 2012).

Depending on timing of the project construction, additional and ongoing site surveillance may also be required to detect whether burrowing owls have colonized or re-colonized the survey area prior to or during project implementation (CDFW 2012).

If habitat that would be impacted by the project is determined occupied by western burrowing owl, habitat-based mitigation would also be required. Temporarily impacted areas would need to be restored to pre-project conditions. Permanent impacts to nesting, occupied and satellite burrows, and/or western burrowing owl habitat would require mitigation such that the habitat acreage, number of burrows, and burrowing owls are replaced (CDFW 2012).

## **E.3. Results of 2018-2019 Burrowing Owl Non-Breeding Season Surveys for the Westside Canal Energy Center Project**

*An Employee-Owned Company*

April 8, 2019

Mr. Jim Pomillo  
Con Edison Clean Energy Businesses, Inc.  
100 Summit Lake Drive  
Valhalla, New York 10595

Reference: Results of 2018-2019 Burrowing Owl Non-Breeding Season Surveys for the Westside Canal Energy Center Project (RECON Number 8888)

Dear Mr. Pomillo:

This letter summarizes the results of the 2018-2019 non-breeding season surveys for western burrowing owl (*Athene cunicularia hypugaea*) conducted for the Westside Canal Energy Center Project (project), which is currently proposed by Con Edison Clean Energy Businesses, Inc. (Con Edison) and was formerly proposed by Sempra Renewables, LLC. Project location and description, burrowing owl natural history and historical occurrence information, prior burrowing owl survey results, survey methods, and results are discussed in detail below. Survey results will be used to assess potential project impacts and identify appropriate avoidance, minimization, and/or mitigation measures. Western burrowing owl was observed within the project survey area during these surveys.

### **Project Location and Description**

The project site is located in an unincorporated area of southwestern Imperial County, approximately 4.5 miles south-southwest of Seeley, California (Figure 1). The main project area includes Assessor's Parcel Numbers 051-350-010 and 051-350-011. Additional project components, including access routes, staging areas, and tie-line connection, include portions of adjacent Assessor's Parcel Numbers 051-350-019, 051-350-018, and 051-350-009. All project components are located in the southern half of Section 34, Township 16 South, Range 12 East, on the U.S. Geological Survey (USGS) Mount Signal, California quadrangle (USGS 1976; Figure 2). An aerial photograph of the survey area is shown on Figure 3.

The project is currently in the design phase and includes development, construction, and operation of the Westside Canal Energy Center (WCEC), a Battery Energy Storage System (BESS) and renewable energy facility project. The project would consist of two distinct phases, WCEC 1 and WCEC 2, and common facilities to support each. WCEC 1 (phase 1) would consist of a Lithium-ion Battery Energy Storage System (BESS) facility, and WCEC 2 (phase 2) would consist of a flow battery BESS facility. The project would also include construction of a new loop-in substation on site, as well as construction of an access road and bridge to provide vehicular access from Liebert Road and across the Westside Canal. The project boundary used in this report is the preliminary project footprint and includes areas currently anticipated for permanent and temporary impacts. At present, construction of the access roads, bridge, and WCEC 1 is anticipated to commence in 2021 and conclude in 2022.

### **Western Burrowing Owl Species Description**

Burrowing owl is a California Department of Fish and Wildlife (CDFW) species of special concern. Western burrowing owl, the western subspecies, is primarily restricted to the western United States and Mexico. Studies conducted by Ruhlen et al. (2004) show that the density and abundance of this species within the Imperial Valley is exceptionally high compared to other areas in southern California.

Project Area on  
Aerial Photograph

Habitat for western burrowing owl includes dry, open, low-growing grasslands, deserts, and scrublands with level to gently sloping topography and well-drained soils (CDFW 2012). These areas are also often associated with burrowing mammals (Haug et al. 1993). Irrigation canals, ditches, and drains immediately adjacent to agricultural fields are also commonly used as nesting sites (Ruhlen et al. 2004). Western burrowing owl is known to use multiple “satellite” burrows in addition to their nesting burrows. Satellite burrows are used to seek protection from predators and for roosting during the non-breeding season (CDFW 2012).

Western burrowing owl is diurnal and typically perches at the entrance to its burrow or on adjacent structures, such as low posts. Nesting typically occurs from March through August. Breeding pairs form a bond for more than one year and exhibit high site fidelity, reusing the same burrow year after year (Haug et al. 1993). The female remains inside the burrow during most of the egg laying and incubation period and is fed by the male throughout this period. Western burrowing owl is an opportunistic feeder, with a diet that includes arthropods, small mammals, and birds, and occasionally amphibians and reptiles (Haug et al. 1993).

Urbanization has greatly reduced the amount of suitable habitat for western burrowing owl. Other contributions to the decline of this species include the poisoning from pest control measures intended to control fossorial mammals, road and ditch maintenance, and collisions with automobiles (CDFW 2012).

### **Previous Habitat Assessment and Breeding Season Survey Summary**

In 2018, RECON Environmental, Inc. (RECON) conducted a literature review, desktop evaluation, habitat assessment, and breeding season surveys for burrowing owl for the project. The assessment and surveys were conducted in accordance with the guidelines developed by CDFW (CDFW 2012); the methods and results are detailed in the survey report prepared by RECON (2018). In summary, the majority of the survey area provides suitable habitat for western burrowing owl, with low stature and/or low-density vegetative cover providing suitable foraging habitat, and fossorial mammals and other man-made structures providing suitable burrows. However, no western burrowing owls were detected within the survey area during the 2018 breeding season surveys.

Vegetation community/land cover type mapping used in this report is largely consistent with that provided in the habitat assessment and breeding season survey report prepared by RECON in 2018. However, minor revisions have been made as a result of the biologists gaining direct access to additional areas and seasonal variations providing a better understanding of plant species composition on site. The updated vegetation mapping is provided on Figure 4, and Photographs 1 through 8 provide representative views of the survey area. Vegetation communities mapped within the survey area include upland mustards (*Brassica* spp. and Other Mustards Semi-Natural Herbaceous Stands), creosote bush scrub (*Larrea tridentata* Shrubland Alliance), fourwing saltbush scrub (*Atriplex canescens* Shrubland Alliance), quailbush scrub (*Atriplex lentiformis* Shrubland Alliance), arrow weed thickets (*Pluchea sericea* Shrubland Alliance), tamarisk thickets (*Tamarix* spp. Semi-Natural Shrubland Stands), common reed marshes (*Phragmites australis* Herbaceous Alliance and Semi-Natural Stands), eucalyptus groves (*Eucalyptus* spp. Semi-Natural Woodland Stands), and cattail marshes (*Typha* sp. Herbaceous Alliance). Additional land cover types include fallow agriculture, active agriculture, disturbed habitat, developed land, and open water.

### **Methods**

For the purposes of this report, the “survey area” includes the project area and the surrounding 150 meters (see Figure 3). At the start of the survey period, only one land owner granted permission to access an adjacent property. Therefore, direct access was limited to lands owned by Con Edison (the majority of the project area south of Westside Canal) and Imperial Irrigation District (one parcel north of Westside Canal), the canal roads (including Mandrapa Road), and Liebert Road. By the fourth survey, full access had been granted to the entire project boundary north and south of Westside Canal; however, the majority of the 150-meter buffer remained unavailable to direct access (see Figure 3). Where direct access was available, areas were surveyed using line transects with surveyors spaced 100 to 200 feet apart, with low to very low vegetation density and cover allowing for excellent ground visibility and wide transect spacing. Areas where direct access was unavailable were surveyed using binoculars or scopes. These areas were surveyed by conducting 15-minute point surveys along the project boundary and access roads, with spacing dependent on the height and density of the surrounding vegetation.

RECON biologists Brenna Ogg, Brian Parker, Beth Procsal, Mandy Weston, JR Sundberg, Kayo Valenti, and Victor Novik conducted burrowing owl non-breeding season surveys in accordance with the guidelines developed by CDFW (CDFW 2012). Surveys included four visits during the burrowing owl's non-breeding season. Each survey was conducted by five biologists over a two-day period, between two hours before sunset and civil evening twilight on the first day and between morning civil twilight and 10:00 on the second day. Surveys were spaced at least four weeks apart. All wildlife species observed during the surveys were noted. All suitable burrows were recorded using a handheld Global Positioning System (GPS) device, and presence or absence of burrowing owl sign (e.g., pellets, whitewash, prey remains, feathers, or decoration) was documented. Survey dates, personnel, times, and weather conditions are provided in Table 1.

Table 1 Survey Information				
Date	Survey Type	Surveyors	Beginning Conditions	Ending Conditions

### Non-Breeding Season Survey Results

Four western burrowing owl observations were made during 2018-2019 breeding season surveys, representing at least two, but likely three, individuals. Each observation is described below, and the observation locations are shown on Figure 5. Data for these western burrowing owl observations were submitted to the California Natural Diversity Database on April 2, 2019.

- One western burrowing owl was observed on November 9, 2018, in creosote bush scrub along the westernmost project boundary. It was flushed from the vicinity of a burrow and flew off to the northwest. The burrow did not have any sign of whitewash, pellets, or feathers, but there was a large number of mammal, insect, and bird tracks, including burrowing owl tracks (Photograph 9).
- One western burrowing owl was observed on December 17, 2018, near the previous observation in creosote bush scrub along the westernmost project boundary, and likely represents a repeat observation of the owl observed on November 9, 2018. The owl was flushed from a small sandy hillock with creosote and a burrow, and flew off to a berm, where it perched for several minutes before flying out of sight.
- One western burrowing owl was observed on December 17, 2018, within an open fallow agricultural field sparsely vegetated by low-growing tamarisk shrubs in the southeastern portion of the survey area. This individual was flushed from the vicinity of a small sinkhole, flew north, and then circled off site to the south. The sinkhole (see Photograph 11) had abundant whitewash and appeared to be an active western burrowing owl burrow. A second burrow with whitewash and pellets was found approximately 135 feet southeast of the first burrow (see Photograph 12).
- One western burrowing owl was detected using an infrared motion-triggered trail camera on December 16, 2018 (Photograph 13). The camera was placed adjacent to a dirt road along the southern project boundary. Two suitable burrows with no owl sign were located approximately 10 feet from the camera location. A third suitable burrow with whitewash had been detected within approximately 45 feet of the camera location during 2018 breeding season surveys; however, that burrow has since been disturbed and partially backfilled by animal activity. Four photos were triggered by a western burrowing owl at 19:16. While the photos are over-exposed, the shape and posture of the bird photographed is consistent with burrowing owl.

As mentioned above, three suitable burrows with western burrowing owl sign (i.e., whitewash, pellets, and/or tracks) were observed near the western burrowing owl observations: one in close proximity to the observation near western project boundary and two near the observations in the fallow agricultural field in the southeastern portion of the project area.

Possible burrowing owl predators detected during the non-breeding season surveys include great horned owl (*Bubo virginianus*), Cooper's hawk (*Accipiter cooperii*), red-tailed hawk (*Buteo jamaicensis*), northern harrier (*Circus hudsonius*), common raven (*Corvus corax*), American crow (*Corvus brachyrhynchos*), and coyote (*Canis latrans*) (Coulombe 1971, Haug et al. 1993). Coyote, red-tailed hawk, and American crow were regularly detected throughout the survey period. Great horned owl is a resident species on site with an active nest observed in the northeastern portion of the survey area. Although not detected during the non-breeding season surveys, RECON has previously observed American badger (*Taxidea taxus*) within the survey area. No evidence of burrowing owl predation was observed.

### Conclusion and Mitigation Requirements

Four western burrowing owl observations were recorded during the 2018-2019 non-breeding season surveys, representing at least two, but likely three, individuals. Based on these results and the negative results of the 2018 breeding season surveys, western burrowing owl appears to use the project area and larger survey area as a wintering site or for migration and dispersal, but is not currently using the site as breeding habitat.

Based on these results, formal consultation with CDFW would be required to develop an appropriate mitigation plan for the project. One or more mitigation measures, such as avoidance, minimization measures, translocation, artificial burrow construction, burrow exclusion and closure, and/or habitat-based mitigation or preservation, may be required.

At a minimum, take-avoidance (pre-construction) surveys for western burrowing owl would be required at least 14 days prior to ground disturbance. This effort would detect any change in western burrowing owl presence within the survey area in order to avoid direct take of owls and inform any necessary take avoidance actions. These surveys would include all areas where suitable habitat is present within the survey area (CDFW 2012). Depending on the timing of construction or any delays in project activities, ongoing site surveillance may be required to detect whether the species has re-colonized the project area prior to or during project implementation (CDFW 2012).

If occupied western burrowing owl habitat would be impacted by the project, habitat-based mitigation would also be required. Temporarily impacted areas would need to be restored to pre-project conditions. Permanent impacts to nesting, occupied and satellite burrows, and/or suitable habitat would require mitigation such that the habitat acreage, number of burrows, and burrowing owls are replaced (CDFW 2012).

If you have any questions concerning the contents of this letter, please contact me by phone or email at (619) 308-9333 extension 118 or [bogg@reconenvironmental.com](mailto:bogg@reconenvironmental.com).

## 1.0 Site Description and Landscape Setting

The Westside Canal Battery Storage Project (Project) would be located in the unincorporated Mount Signal area of Imperial County, approximately 8.0 miles southwest of the city of El Centro and approximately 5.3 miles north of the U.S.-Mexico border. Figure 1 (in Attachment 1) shows the regional location of the Project. The Project site is comprised of two parcels owned by Westside Canal Battery Storage, LLC, a subsidiary of Con Edison Clean Energy Businesses: Assessor Parcel Number (APN) 051-350-010 and APN 051-350-011, totaling approximately 148 acres. These parcels have limited access corridors for vehicular traffic and are considered less desirable for agricultural production, as reflected by the last 15 years during which no farming activity has occurred.

The Project site is approximately one-third mile north of the Imperial Valley Substation and directly south of the intersection of Liebert Road and the Imperial Irrigation District's (IID) Westside Canal. The Project site is bounded by the Westside Canal to the north, Bureau of Land Management lands to the south and west, and vacant private land to the east. The Campo Verde solar generation facility is located north of the Project site, across the Westside Canal. The entire Project site is located in the southern half of Section 34, Township 16 South, Range 12 East, on the U.S. Geological Survey (USGS) Mount Signal, California quadrangle (USGS 1976; Attachment 1: Figure 2). An aerial photograph of the Review Area is shown in Attachment 1: Figure 3.

The two Project parcels are proposed for development as a utility-scale energy storage complex. The Project would also utilize portions of two parcels located north of the Westside Canal (APN 051-350-019 owned by IID and APN 051-350-018 owned by a private land owner) for site access and as a temporary construction staging area. The Project would also access a small portion of APN 051-350-009 within an IID easement for connection to the existing IID Campo Verde Imperial Valley 230 kilovolt radial gen-tie line during the construction of a switching station on the Project site. The total proposed Project development footprint, encompassing both temporary and permanent impacts, would be approximately 163 acres.

The applicant will accompany the U.S. Army Corps of Engineers (USACE) on all site visits. The USACE must contact the applicant prior to visiting the site. The contact information for the applicant is:

Property Owner:	Westside Canal Battery Storage, LLC
Applicant:	Westside Canal Battery Storage, LLC
Primary Contact:	Curtis Kebler, Director, Business Development
Telephone:	(619) 318-6735
E-mail:	KeblerC@conedceb.com

## 2.0 Site Alterations, Current and Past Land Use

A majority of the Review Area has been altered by past agricultural uses. The land was likely graded and the soil regularly tilled, fertilized, and watered. During agricultural operations, it likely supported minimal natural vegetation. The agricultural fields within the Review Area have been left fallow for approximately the past ten years.

### 2.1 Soils

Information on the soil types occurring in the Review Area is summarized from the Soil Survey for Imperial County (U.S. Department of Agriculture [USDA] 1981) and the Hydric Soils of California list (hydric soil list) obtained from the Natural Resource Conservation Service (NRCS; 2015). Soil types mapped within the Review Area are shown in Attachment 1: Figure 4. The following 10 soil types are mapped within the Review Area: Glenbar complex; Holtville silty clay, wet; Imperial-Glenbar silty clay loams, wet, 0–2 percent slopes; Indio-Vint complex; Meloland fine sand; Meloland very fine sandy loam, wet; Rositas fine sand, 0–2 percent slopes; Rositas fine sand, wet, 0–2 percent slopes; Vint loamy very fine sand, wet; and Vint and Indio very fine sandy loams, wet (USDA 1981). Water is also mapped within the Westside Canal (see Attachment 1: Figure 4). None of these soil types are listed as hydric in Imperial County.

### 2.2 Hydrology

The Westside Canal is a manmade, natural-bottom canal conveying water from the All-American Canal for irrigation use within the Imperial Valley area. It crosses through the northern portion of the Review Area, flowing east to west. Within the Review Area, a drop structure, known as the Fern Check structure, occurs within the canal and regulates water levels. During the survey, water levels were regulated at approximately 18 inches below the top of the bank east of the drop structure, and approximately five feet below the top of the bank west of the drop structure. In addition to the Westside Canal, the east-west concrete-lined secondary canal mentioned above and a concrete-lined secondary canal extending north-south in the northeast portion of the Review Area contained flowing water at the time of the survey.

### 2.3 Vegetation

The following vegetation communities and land cover types were mapped within the Review Area: upland mustards (*Brassica* spp. and Other Mustards Semi-Natural Herbaceous Stands), creosote bush scrub (*Larrea tridentata* Shrubland Alliance), four-wing saltbush scrub (*Atriplex canescens* Shrubland Alliance), quailbush scrub (*Atriplex lentiformis* Shrubland Alliance), arrow-weed thickets (*Pluchea sericea* Shrubland Alliance), tamarisk thickets (*Tamarix* spp. Semi-Natural Shrubland Stands), common reed marshes (*Phragmites australis* Herbaceous Alliance and Semi-Natural Stands), eucalyptus groves

(*Eucalyptus* spp. Semi-Natural Woodland Stands), cattail marshes (*Typha* sp. Herbaceous Alliance), disturbed habitat, fallow agriculture, open water, and developed land (Attachment 2: Table 1; Attachment 1: Figure 5).

## 3.0 Precipitation Data and Analysis

Climate data, including precipitation totals, for the nearest recording station to the Project site was gathered from the NRCS National Water and Climate Center databases (NRCS 2020). The climate data obtained are discussed below.

### 3.1 Climate and Growing Season

The Review Area is located within the Sonoran Desert region of southern California, in an area generally characterized as hot dry throughout most of the year, with slightly cooler and wetter winters. The majority of precipitation typically falls between December and March as somewhat frequent low-intensity rainfall. Infrequent and very localized high-intensity monsoonal rainfall can occur during the summer months. The growing season is typically very short after winter rainfall as precipitation amounts are low and temperatures begin to increase quickly during the spring months and into summer.

### 3.2 Antecedent Precipitation Tool Summary

The Antecedent Precipitation Tool was used to analyze the 30-day rolling total and the 30-year normal range of precipitation data for the nearest recording weather stations to the Review Area. The data presented in the Antecedent Precipitation Tool Results graphic (Attachment 3) indicate that minimal precipitation occurred in the vicinity of the Review Area in the days prior to the February 5, 2018 survey and that normal conditions occurred at the time of the survey.

The three canal features that occur within the Review Area are likely insignificantly affected by local precipitation amounts because flow within these features is regulated by a series of drop structures.

### 3.3 Wetland Hydrology and Analysis

Hydrology within the Review Area as a whole consists of only the three manmade canal features described above. These do not appear to be significantly influenced by precipitation events and they are all controlled using drop structures.

Manufactured drainage ditches, both concrete-lined and natural-bottomed, occur along berms that define the boundaries of abandoned agricultural fields throughout much of the Review Area. However, these drainage ditches appear to be unused since abandonment of the agricultural operations on-site. No other portions of the Review Area contain topographic bottomlands where a substantial amount of water could concentrate and/or flow to develop hydrology indicators.

## 4.0 Investigation Methods

A routine jurisdictional waters/wetland delineation, following the guidelines set forth by USACE (1987 and 2008), was performed to gather field data at locations with potential jurisdictional waters in the Project Review Area. The Review Area for this study, as identified by the Westside Canal Battery Storage, LLC, comprises the proposed Project boundary and the surrounding 100-foot radius (see Attachment 1: Figure 3). RECON biologist Andrew Smisek conducted the routine delineation fieldwork on February 5, 2019. Once on-site, the potential federal and state jurisdictional areas were examined to determine the presence and extent of any jurisdictional waters.

### 4.1 Wetland Parameters

#### 4.1.1 Hydrophytic Vegetation

Vegetation communities comprising partially or entirely hydrophytic plant species were examined, and data for each vegetation stratum (i.e., tree, shrub, herb, and vine) were recorded on the datasheet provided in the 2008 Arid West Regional Supplement (USACE 2008). The percent absolute cover of each species present was visually estimated and recorded.

First, the wetland indicator status of each species recorded within a vegetation community was determined by using the National Wetland Plant List (Lichvar et al. 2016). Dominant species with an indicator status of NI (No Indicator) or not listed in the 2016 National Wetland Plant List were evaluated as either wetland or upland indicator species based on local professional knowledge of where the species are most often observed in habitats that are characteristic in southern California.

The dominance test was then used to determine which vegetation community qualified as hydrophytic vegetation at each site. In situations where a site failed the dominance test but contained positive indicators of hydric soils and/or wetland hydrology, the prevalence index was used. The presence or absence of morphological adaptations was noted; however, none of the sampled wetland areas required an analysis of morphological adaptations to determine if the vegetation was hydrophytic.

#### 4.1.2 Hydric Soils

Sample points were selected within potential wetland areas and where the apparent boundary between wetland and upland was inferred based on changes in the composition of the vegetation and topography. Soil pits were dug to a depth of at least 18 inches or to a depth necessary to determine soil color, evidence of soil saturation, depth to groundwater, and indicators of a reducing soil environment (i.e., mottling, gleying, and hydrogen sulfide odor). A Munsell Soil-Color Book (2009) was used to determine soil colors, and the 2008 Arid West Regional Supplement (USACE 2008) and the Field Indicators of Hydric Soils in

the United States guide (USDA 2017) was used to determine the presence of hydric soil indicators.

### 4.1.3 Wetland Hydrology

Hydrologic information for the site was obtained by reviewing USGS topographic maps and by directly observing hydrology indicators in the field. All portions of any potentially occurring wetlands or non-wetland waters within the Review Area were inspected for signs of hydrology as defined in the 2008 Arid West Regional Supplement (USACE 2008). The location of any water conveyance structures, such as culverts, that may influence the hydrology of any potentially jurisdictional resource were recorded and considered when making a hydrology determination.

## 4.2 Pre-Field Review

Prior to conducting the delineation, an aerial photograph, USGS topographic maps of the site, USDA soil maps of the site, the Mount Signal, California quadrangle (USGS 1976), and the U.S. Fish and Wildlife Service National Wetland Inventory (NWI) were examined to aid in the determination of potential waters of the U.S. on-site (U.S. Fish and Wildlife 2019; Attachment 1: Figure 6).

## 4.3 On-site Wetland Investigation

Once on-site, the parcel of land was examined to determine the presence of any indicators of wetlands, including wetland vegetation, hydric soils, and hydrology. Field data, including hand drawn maps and recorded global positioning system (GPS) points and lines, were later digitized/downloaded into ArcGIS. Mapped jurisdictional waters created using these data were analyzed in ArcGIS to provide acreages or target jurisdictional and vegetation boundaries. USACE wetland determination data forms are included as Attachment 4, USACE Ordinary High Water Mark (OHWM) data forms are included as Attachment 5, and photographs of the Review Area are provided in Attachment 6. Descriptions of the potential wetland vegetation communities sampled are provided below.

Quailbush scrub occurs in two patches north of the Westside Canal in the northern portion of the survey area (Attachment 1: Figure 5). At approximately 50 percent cover, quailbush (Facultative [FAC]) dominates this vegetation community (Attachment 6: Photograph 1). The understory is mostly bare, with sparse cover of upland herbaceous species such as Bermuda grass (*Cynodon dactylon*; Facultative-Upland [FACU]) and non-native mustard (*Sisymbrium* sp.; FACU). The eastern patch of quailbush scrub is small and surrounded by arrow weed thickets and Eucalyptus woodland. The western patch of this vegetation community is larger, extending north and west outside the survey area. Both patches occur within areas that appear to have been historically used for agriculture but have since been abandoned. Manufactured berms and ditches occur along much of the perimeter of the patches. Although the ditches are no longer used for irrigation, these patches of quailbush scrub occur within 25 feet of an actively used, concrete-lined secondary canal, and within

100 feet of the Westside Canal. Laterally seeping water from these sources may contribute to the presence of quailbush scrub within the survey area.

Arrow weed thickets occur in five different patches throughout the survey area, the majority of which occur as linear strips paralleling the Westside Canal and an actively used, concrete-lined secondary canal (Attachment 1: Figure 5). Arrow weed (Facultative-Wetland [FACW]) dominates this vegetation community at approximately 50 percent cover (Attachment 6: Photograph 2).

Occasional saltcedar (*Tamarix ramosissima*; NI) occur within this vegetation community, and the understory consists of a sparse cover of non-native mustard and narrow-leaved cryptantha (*Cryptantha angustifolia*; NI) occurring in openings between shrubs. As with the quailbush scrub, lateral seepage from the Westside Canal and secondary canal may contribute to the presence of this hydrophytic vegetation community.

Tamarisk thickets occur mostly as patches within the southern portion of the survey area (Attachment 1: Figure 5). One patch occurs as a linear strip paralleling the Westside Canal in the northern portion. This patch is dominated by saltcedar at approximately 50 percent cover. Although saltcedar does not have a wetland indicator status, it generally occurs within stream corridors in this region. Therefore, a wetland indicator status of FAC has been assigned for the purposes of this report. The saltcedar individuals in this northern patch appear mature and robust. The tamarisk thickets in the southern portion of the survey area mostly occur along a network of berms and ditches that were likely historically manufactured for agriculture use but have since been abandoned. These small and linear patches of tamarisk thickets are dominated by either saltcedar with an approximate cover of 30 percent or athel (*Tamarix aphylla*; FAC) with an approximate cover of 80 percent (Attachment 6: Photograph 3). The patches of athel were likely planted as a wind screen when the site was actively used for agriculture. One patch of tamarisk thicket occurs within an abandoned agriculture field in the southeast portion of the survey area and contains sparse saltcedar at approximately 10 percent cover. The individuals here appear stressed with substantially diminished canopies.

Common reed marshes occur as linear strips averaging between 5 and 10 feet in width along the banks of the Westside Canal in the northern portion of the survey area. This vegetation community is dominated by common reed (FACW) which has approximately 35 percent cover (Attachment 6: Photograph 4). Arrow weed occurs in most portions of this vegetation community as a subdominant species at approximately five percent cover. The banks of the canal are steep and contain a substantial proportion of large rock and pieces of concrete. Although common reed growth occurs both along the slope and on top of the banks, no growth occurs from portions of the bank at or below the water level.

Cattail marshes occur only within the small, concrete-lined secondary canal extending east-west north of the Westside Canal in the northern portion of the survey area. This vegetation community is dominated by southern cattail (*Typha domingensis*; Obligate [OBL]) as noted in previous surveys conducted for this Project (RECON 2018). However, it appears this vegetation was dug out of the secondary canal prior to this survey, as the removed cattails were observed piled nearby.

## 4.4 On-site Ordinary High Water Mark Investigation

The lateral extent of the OHWM was delineated using the observed hydrology indicators within the Westside Canal and two concrete-lined secondary canals in accordance with *A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States* (Lichvar and McColley 2008). The indicators observed include surface water, water staining, and drift deposits. Based on observations made during other surveys conducted for this Project during various times of the year since April 2018, it is assumed these three manufactured canals actively convey water continuously. Photographs of the three canals are provided in Attachment 6 (see Photographs 5–7). Water flow within these features is regulated through a series of drop structures to fulfill the irrigation demands of the surrounding agricultural land uses. It appears the volume of flow within these three features is fairly consistent.

## 5.0 Description of All Wetlands and Other Non-wetland Waters

The aquatic resources delineated include three non-wetland waters features within the Review Area, the Westside canal and two secondary canals. No wetland areas were detected. A summary of the aquatic resources and location of these resources in relation to the Review Area boundary are provided in Attachment 2: Table 2 and on Attachment 1: Figure 7, respectively.

### 5.1 Wetlands

No wetlands were delineated within the Review Area. The areas containing hydrophytic vegetation did not contain hydrology or hydric soil indicators (see Attachment 4). Although it is possible that the area of cattail marshes within the Review Area would have met all three wetland parameters, this wetland habitat was removed prior to the jurisdictional delineation survey and, therefore, was not delineated as a wetland for this report.

### 5.2 Non-wetland Waters

A total of 5.97 acres and 6,475 linear feet of non-wetland waters were delineated within the Review Area (see Attachment 2: Table 2). Non-wetland waters within the Review Area include the Westside Canal, the east-west concrete-lined secondary canal, and the north-south concrete-lined secondary canal. The lateral extent of each of these features was based on the OHWM, as determined by hydrology indicators. The Westside Canal averages approximately 90 feet in width throughout the Review Area. The east-west canal is approximately 4 feet in width, and the north-south canal is approximately 15 feet in width.

The Westside Canal flows west and north from the Project site through an expanse of agricultural land where it is used to irrigate agricultural fields. Any unused water within the canal continues north through a series of drains to empty into the Salton Sea, a Traditional Navigable Waterway (TNW). The two concrete-lined canals also extend from the Review Area throughout the expanse of agriculture land and connect with other canals and waterways, eventually draining into the Salton Sea. Additionally, as the Westside Canal and these secondary canals are assumed to convey water nearly continuously, they would be considered Relatively Permanent Waters. Their connectivity to a TNW and status as Relatively Permanent Waters would likely put the Westside Canal and these two concrete-lined secondary canals within the Review Area under the jurisdiction of USACE.

## **6.0 Deviation from National Wetland Inventory**

The results of this analysis varies slightly from the NWI (see Attachment 1, Figure 6). The NWI includes a perennial riverine system with a natural bottom (code R2UBHx) along the alignment of the Westside Canal within the Review Area. This description is accurate with what was observed during the survey (see Attachment 2: Table 2). The NWI also includes an intermittent riverine system (code R4SBCx) along the alignment of the 15-foot-wide north-south running canal. However, based on regular field surveys since April 2018 and a review of aerial photography, this canal is likely perennial (see Attachment 2: Table 2). The fact that this canal is concrete-lined is not included in the NWI details for this feature. No system is mapped by the NWI along the 4-foot-wide east-west running canal. As with the north-south canal, this feature appears to be perennial (see Attachment 2: Table 2). All three features within the Review Area are subject to regulated water flow through the use of drop structures.

## **7.0 Mapping Method**

The maps of the delineated jurisdictional waters within the Review Area are based on the above analysis. The boundary of the majority of aquatic resource was obtained from a combination of GPS data collected in the field and aerial photography. Geographic information system mapping software (ArcMap) was used to produce the graphical maps contained in this report.

## **8.0 Results and Conclusions**

Potential USACE jurisdictional waters include all three non-wetland waters features mapped within the Review Area: the Westside canal, the east-west concrete-lined canal, and the north-south concrete-lined canal. As described above, hydrology indicators were used to delineate the OHWM for each of these features. Flow within these features is regulated by a series of drop structures for the purposes of the surrounding agricultural needs. Because it appears these features flow perennially, and because they have a direct connection downstream to a TNW, they may be considered non-wetland waters of the U.S.

type for these features is considered to be “relatively permanent waters” due to their perennial flow and connectivity with a TNW.

## 9.0 Disclaimer Statement

This report describes the results of a jurisdictional waters delineation conducted within the approximately 163-acre Review Area. The jurisdictional waters delineation is used to identify and map the potential extent of the federal jurisdictional waters of the U.S. The purpose of this study was to identify and map the limits of any aquatic water features on the property to provide necessary background information for analysis by USACE in making a jurisdictional determination. USACE will review the content of this report and ultimately make a determination of federal jurisdiction for any waters of the U.S. that may be present in the Review Area. References used in the preparation of this report are included below in Attachment 7.

Remarks: The vegetation here occurs within an area surrounded by berms and just north of the canal and irrigation channels.				

## SOIL

Sampling Point: 2

**Profile Description:** (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

[illegible]

<sup>1</sup>Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains.

<sup>2</sup>Location: PL=Pore Lining, RC=Root Channel, M=Matrix.

**Hydric Soil Indicators:** (Applicable to all LRRs, unless otherwise noted.)

- ☐ Histosol (A1)
- ☐ Histic Epipedon (A2)
- ☐ Black Histic (A3)
- ☐ Hydrogen Sulfide (A4)
- ☐ Stratified Layers (A5) (**LRR C**)
- ☐ 1 cm Muck (A9) (**LRR D**)
- ☐ Depleted Below Dark Surface (A11)
- ☐ Thick Dark Surface (A12)
- ☐ Sandy Mucky Mineral (S1)
- ☐ Sandy Gleyed Matrix (S4)

- ☐ Sandy Redox (S5)
- ☐ Stripped Matrix (S6)
- ☐ Loamy Mucky Mineral (F1)
- ☐ Loamy Gleyed Matrix (F2)
- ☐ Depleted Matrix (F3)
- ☐ Redox Dark Surface (F6)
- ☐ Depleted Dark Surface (F7)
- ☐ Redox Depressions (F8)
- ☐ Vernal Pools (F9)

### Indicators for Problematic Hydric Soils<sup>3</sup>:

☐ 1 cm Muck (A9) (**LRR C**)  
☐ 2 cm Muck (A10) (**LRR B**)  
☐ Reduced Vertic (F18)  
☐ Red Parent Material (TF2)  
☐ Other (Explain in Remarks)

<sup>3</sup>Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

## Restrictive Layer (if present):

Type: \_\_\_\_\_

**Cross section drawing:**

**OHWM**

GPS point: \_\_\_\_\_

**Indicators:**

- |   |  |
|---|--|
| <input type="checkbox"/> Change in average sediment texture | <input checked="" type="checkbox"/> Break in bank slope          |
| <input type="checkbox"/> Change in vegetation species       | <input checked="" type="checkbox"/> Other: <u>surface water</u>  |
| <input type="checkbox"/> Change in vegetation cover         | <input checked="" type="checkbox"/> Other: <u>water staining</u> |

**Comments:**

The OHWM appears obvious at the water surface level where substantial water staining is present. The water levels within this canal appear to be maintained at a mostly consistent level.

**Floodplain unit:**    ☒ Low-Flow Channel    ☒ Active Floodplain    ☐ Low Terrace

GPS point: \_\_\_\_\_

**Characteristics of the floodplain unit:**

Average sediment texture: \_\_\_\_\_

Total veg cover: 0 %    Tree: \_\_\_\_\_ %    Shrub: \_\_\_\_\_ %    Herb: \_\_\_\_\_ %

Community successional stage:

- |   |  |
|---|--|
| <input checked="" type="checkbox"/> NA                  | <input type="checkbox"/> Mid (herbaceous, shrubs, saplings)      |
| <input type="checkbox"/> Early (herbaceous & seedlings) | <input type="checkbox"/> Late (herbaceous, shrubs, mature trees) |

**Indicators:**

- |  |  |
|--|--|
| <input type="checkbox"/> Mudcracks                           | <input type="checkbox"/> Soil development                        |
| <input type="checkbox"/> Ripples                             | <input type="checkbox"/> Surface relief                          |
| <input checked="" type="checkbox"/> Drift and/or debris      | <input checked="" type="checkbox"/> Other: <u>surface water</u>  |
| <input checked="" type="checkbox"/> Presence of bed and bank | <input checked="" type="checkbox"/> Other: <u>water staining</u> |
| <input type="checkbox"/> Benches                             | <input type="checkbox"/> Other: _____                            |

**Comments:**

The active floodplain occurs below the OHWM which appeared obvious at the surface water level where substantial water staining is present. The canal was manufactured to have a bed and bank, and small drift deposits were observed.

Project ID: 8888.1

Cross section ID: 1

Date: February 5, 2019 Time: 1200

**Floodplain unit:** ☐ Low-Flow Channel ☐ Active Floodplain ☒ Low Terrace

GPS point: \_\_\_\_\_

NV5 Project No: 1076

Subject: Preliminary Geotechnical Investigation Report

Project: Westside Canal Energy Center  
Imperial Valley, California

Dear Mr. Pomillo:

As requested, NV5 is pleased to present the results of the preliminary geotechnical investigation for the subject project. The purpose of the investigation was to evaluate the subsurface conditions at the proposed Westside Canal Energy Center (WCEC) site located in the Imperial Valley area of Imperial County, California. It is understood that the site encompasses approximately 127 acres located on the south side of the Westside Main Canal, and approximately 2,000 feet north of the existing Imperial Valley Substation. It is understood that the project will include the WCEC Project Substation, the T.O. Interconnection Substation, solar photovoltaic arrays, battery storage, an operations and maintenance facility, and a bridge over the Westside Main Canal which will provide primary site access. Per NV5's proposal for geotechnical engineering services dated August 28, 2018, geotechnical design parameters for the proposed was excluded from the scope of this investigation and will be completed at a later date under a separate proposal. The results of the geotechnical field explorations, laboratory tests, and geotechnical engineering recommendations and conclusions are presented herewith.

Based on the subsurface exploration, subsequent testing of the subsurface soils, and engineering analyses, it was concluded that the construction of the proposed project is geotechnically feasible. The geotechnical information presented herein is intended to assist the project design team and construction contractor in their understanding of the geotechnical factors affecting the proposed project, and the preliminary recommendations will be incorporated into the project design and implemented construction.

The forthcoming project specifications, in particular the earthwork/compaction sections, should be reviewed by NV5 for consistency with this report prior to the bid process in order to avoid possible conflicts, misinterpretations, and inadvertent omissions. It should also be noted, that the applicability and final evaluation of the recommendations presented herein, are contingent upon construction phase field monitoring by NV5, in light of the widely acknowledged importance of geotechnical consultant continuity through the various design, planning and construction stages of a project.

NV5 appreciates the opportunity to provide this geotechnical engineering service for this project and looks forward to continuing its role as your geotechnical engineering consultant.

Respectfully submitted,

**NV5 West, Inc.**

## 1.0 INTRODUCTION

This report presents results of NV5's preliminary geotechnical investigation for the proposed Westside Canal Energy Center (WCEC) in Imperial Valley, California. The approximate location of the project area is shown on *Figure 1, Site Location Map*. The purpose of this study was to evaluate the subsurface conditions at the project site and to provide preliminary geotechnical recommendations for the design and construction of the proposed facility. This report summarizes the data collected and presents findings, conclusions, and preliminary recommendations.

This report has been prepared for the exclusive use of the client and their consultants to describe the geotechnical factors at the project site which should be considered in the design and construction of the proposed project. In particular, it should be noted that this report has not been prepared from the perspective of a construction bid preparation instrument and should be considered by prospective bidders only as a source of general information subject to interpretation and refinement by their own expertise and experience, particularly with regard to construction feasibility. Contract requirements as set forth by the project plans and specifications will supersede any general observations and specific recommendations presented in this report.

## 2.0 SCOPE OF SERVICES

NV5's scope of services for this project included the following tasks:

- Review of readily available background data, published geologic maps, topographic maps, seismic hazard maps and literature relevant to the subject site.
- Review of a preliminary project sketch provided by Sempra Renewables.
- Coordinating with entities having an interest in the field exploration activities including Sempra Renewables, the drilling subcontractor (Pacific Drilling), and Underground Service Alert (USA) for mark-out prior to site exploration.
- Conducting a subsurface investigation, which included the drilling, logging, and sampling of seven (7) exploratory borings located within the project area to a maximum depth of approximately 80 feet below ground surface (bgs). The original proposed scope of work included six (6) borings; however, an additional boring (B-1a) was performed adjacent to boring B-1 which was terminated due to drilling contractor's equipment issues. Soil samples obtained from the borings were transported to NV5's in-house laboratory for observation and testing.
- Performing laboratory testing on selected representative bulk and relatively undisturbed soil samples obtained during the field exploration program to evaluate their pertinent geotechnical engineering properties.
- Site electrical resistivity evaluation using the 4-pin Wenner method.
- Performing an assessment of general seismic conditions and geotechnical hazards affecting the area and potential impacts on the subject project.
- Engineering evaluation of the data collected to develop geotechnical design parameters and recommendations for the design of the proposed construction.

- Preparation of this report including reference maps and graphics, presenting findings, conclusions and geotechnical recommendations for the design and construction of the proposed project.

### 3.0 SITE AND PROJECT DESCRIPTION

The proposed WCEC site is located in the Imperial Valley area of Imperial County, California. The area in the immediate vicinity of the project limits, as shown on the conceptual site layout provided by Sempra Renewables, is relatively flat with a gentle gradient downward to the northeast. A graded agricultural pad in the south-central portion of the project site rests approximately 8 feet above the northern portion of the site. Elevations at the project site range from approximately 3 to 21 feet below mean sea level. The Westside Main Canal lies to the north of the site (refer to *Figure 2, Field Exploration Plan*). The property is currently undeveloped, was graded for agricultural use in the past, and is sparsely vegetated with weeds. Overhead electrical transmission lines and transmission towers are located immediately to the west and south of the site. The transmissions lines extend from the existing Imperial Valley Substation approximately 0.3 miles south of the WCEC.

Based on preliminary information provided by Sempra Renewables, it is understood that the proposed construction includes the WCEC Project Substation, the T.O. Interconnection Substation, solar photovoltaic arrays, battery storage, an operations and maintenance facility, and a bridge over the Westside Main Canal which will provide primary site access. Detailed site layout and construction plans had not been developed as of the date of this report.

### 4.0 FIELD EXPLORATION PROGRAM

Before starting NV5's field exploration program, Underground Service Alert was notified of the operations for underground utility marking at the locations of exploration. The subsurface conditions were explored from September 17 through October 2, 2018 by drilling, logging, and sampling of seven exploratory borings (B-1 and B-1a through B-6). The borings were drilled to maximum depths ranging between about 20 to 80 feet bgs by Pacific Drilling using a Unimog M-5 hollow stem auger drill rig and a Diedrich D-50 Turbo hollow stem auger and mud-rotary drill rig.

The borings were logged by an NV5 geologist. Representative samples of the soils encountered were obtained for visual soils classification and laboratory testing. The soil conditions encountered in the borings were visually examined, classified, and logged in general accordance with the Unified Soil Classification System (USCS). The logs of the exploratory test borings are presented in *Appendix A, Exploratory Boring Logs*. The approximate locations of the exploratory borings are presented on *Figure 2, Field Exploration Plan*. Subsequent to logging and sampling, the borings were backfilled.

The bulk and relatively undisturbed drive samples of the soils encountered in the borings were tagged in the field and transported to NV5's laboratory for observation and testing. The drive samples were obtained using the California Modified Split Spoon and Standard Penetration Test (SPT) samplers, as described below.

### California Modified Split Spoon Sampler

The split barrel drive sampler was driven with a 140-pound hammer allowed to drop freely 30 inches in general accordance with ASTM D1587. The number of blows for the last two of three 6-inch intervals were recorded during sampling and are presented in the logs of borings. The sampler has external and internal diameters of approximately 3.0 and 2.4 inches, respectively, and the inside of the sampler is lined with 1-inch-long brass rings. The relatively undisturbed soil samples within the rings were removed, sealed, and transported to the laboratory for observation and testing.

### Standard Penetration Test (SPT) Sampler

A split barrel sampler was driven with a 140-pound hammer allowed to drop freely 30 inches in general accordance with ASTM D1586. The numbers of blows for the last two of three 6-inch intervals were recorded during sampling and are presented in the logs of borings (i.e., N-value). The sampler has external and internal diameters of 2.0 and 1.375 inches, respectively. The soil samples obtained in the interior of the barrel were measured, removed, sealed and transported to the laboratory for observation and testing.

## 5.0 FIELD RESISTIVITY TESTING

On-site resistivity surveys were conducted from September 20 through September 21, 2018, in general accordance with ASTM Method G57. The locations of the aforementioned tests can be found on *Figure 2, Field Exploration Plan*. The surveys were conducted along two perpendicular lines with readings taken with electrode spacings of 2, 4, 6, 8, 12, 20, 30, 50, 100 and 200 feet. The resistivity testing services were provided by Southwest Geophysics, Inc. under subcontract agreement with NV5. Details of the resistivity surveys and test data are presented in *Appendix B, Field Resistivity Test Data*.

## 6.0 LABORATORY SOIL TESTING

Laboratory testing was performed on selected representative bulk and relatively undisturbed soil samples obtained from the exploratory borings, to aid in the material classifications and to evaluate engineering properties of the materials encountered (see *Appendix C, Laboratory Test Results*). The following tests were performed:

- In-situ density and moisture content (ASTM D2937 and ASTM D2216);
- Particle size analyses (ASTM D6913, ASTM D2487 and ASTM D1140);
- Direct shear (ASTM D3080);
- Expansion index (ASTM D4829);
- Atterberg Limits (ASTM 4318);
- Thermal Resistivity (ASTM D5334 and IEEE 442);
- R-Value (ASTM D2844); and

- Corrosivity test series including sulfate content, chloride content, pH-value, and resistivity (CTM 417, 422 and 532/643, respectively).

Testing was performed in general accordance with applicable ASTM standards, Institute of Electrical and Electronics Engineers (IEEE) standards, and California Test Methods. A summary of the laboratory testing program and the laboratory test results are presented in *Appendix C*.

## 7.0 GEOLOGY

### 7.1 GEOLOGIC SETTING

The project site is located in Imperial County in the southern portion of the Salton Trough, a structural depression within the Colorado Desert geomorphic province. This province is generally a low-lying barren desert basin (in part about 230 feet below mean sea level) dominated by the Salton Sea. The province is a depressed block between active branches of the San Andreas fault system. The fault branches are buried by recent alluvial deposits. The dominant structural features related to the San Andreas fault system consist of northwest-trending faults and fault zones. The major northwest-trending fault zones include the San Jacinto fault, Imperial fault, the Superstition Hills fault, the Elsinore fault and the San Andreas fault. The Salton Trough has been inundated during the Quaternary by an ancient freshwater lake (Lake Cahuilla) which resulted in a sequence of lacustrine (lake) deposits consisting of interbedded sand silt and clay. Remnants of the ancient shorelines of the extinct Lake Cahuilla remain prevalent in the Salton Trough.

### 7.2 SUBSURFACE CONDITIONS

Geologic materials encountered during the subsurface explorations consisted of natural deposits mapped as Quaternary-aged alluvial deposits and Cahuilla Beds (Qa-Qc, undifferentiated) on published geologic maps. *Figure 3, Regional Geologic Map* presents the general distribution of geologic units in the site area. As encountered in the borings, the soils ranged from tan to brown, dry to wet, stiff to hard lean clay and silt, and medium dense to very dense silty sand and poorly-graded sand with silt. Detailed descriptions of the earth materials encountered are presented on the boring logs in *Appendix A*.

### 7.3 GROUNDWATER

Groundwater was encountered in the exploratory borings at depths between approximately 9 and 19.1 feet bgs, and indicated in the following Table 1.

**Table 1 - Depth to Groundwater as Measured in Each Boring**

Boring Number	Depth to Groundwater
B-1	9.5 feet
B-1a	9.0 feet
B-2	12.0 feet
B-3	19.1 feet
B-4	Not encountered
B-5	14.0 feet
B-6	18.0 feet

Groundwater levels may vary due to seasonal fluctuations and factors such as a substantial increase in surface water infiltration from landscape irrigation, agricultural activity, storage facility leaks or unusually heavy precipitation. There is uncertainty in the accuracy of short-term groundwater level measurements, particularly in fine-grained soil. The groundwater level, as reported herein, should not be interpreted to represent an accurate or permanent condition. Seasonal variations in the groundwater levels should be anticipated.

## 7.4 FAULTS

The numerous faults in southern California include active, potentially active, and inactive faults. As used in this report, the definitions of fault terms are based on those developed for the *Alquist-Priolo Special Studies Zones Act of 1972* and published by the California Division of Mines and Geology (Hart and Bryant, 1997). Active faults are defined as those that have experienced surface displacement within Holocene time (approximately the last 11,000 years) and/or have been included within any of the state-designated Earthquake Fault Zones (previously known as *Alquist-Priolo Special Studies Zones*). Faults are considered potentially active if they exhibit evidence of surface displacement since the beginning of Quaternary time (approximately two million years ago) but not since the beginning of Holocene time. Inactive faults are those that have not had surface movement since the beginning of Quaternary time.

Review of geologic maps and literature pertaining to the general site area indicates that the site is not located within a state-designated Earthquake Fault Zone. Review of the *Earthquake Zones of Required Investigation, Mount Signal Quadrangle, California Geologic Survey, Official Map, dated September 12, 2012* indicates that the project site does not lie within an identified earthquake fault zone (see *Figure 5*). In addition, there are no known major or active faults mapped on the project site. Evidence for active faulting at the site was not observed during the subsurface investigation. The relative location of the site to known active faults in the region is depicted on *Figure 4, Regional Fault Map*. The distance from the site to the projection of traces of surface rupture along major active earthquake fault zones, that could affect the site are listed in the following Table 2.

**Table 2 - Distance From the Site to Major Active Faults**

Fault Name	Distance From the Site
Route 247 fault zone	1.3 miles
Yuha fault	3.7 miles
North Centinela fault	4.4 miles
Yuha Well fault	5.7 miles
Laguna Salada fault	8.4 miles
Superstition Hills fault	9.7 miles
San Jacinto fault	10.9 miles
Imperial fault	14.7 miles
Elsinore fault	17.2 miles
Elmore Ranch fault	22.3 miles
San Andreas fault	42.7 miles
Earthquake Valley fault	46.9 miles
Algodones fault zone	68.8 miles
Newport Inglewood-Rose Canyon fault	83.9 miles
Palos Verdes-Coronado Bank fault	85.8 miles
Burnt Mountain fault	91.9 miles
Eureka Peak Fault	92.4 miles
Pinto Mountain fault	95.9 miles

## 8.0 SEISMIC AND GEOTECHNICAL HAZARDS

The principal seismic considerations for most facilities in southern California are damage caused by surface rupturing of fault traces, ground shaking, seismically induced ground settlement and liquefaction. Potential impacts to the project due to faulting, seismicity and other geologic hazards are discussed in the following sections.

### 8.1 FAULT RUPTURE

The project site is not located within an *Earthquake Fault Zone* delineated by the State of California for the hazard of fault surface rupture. The surface traces of known active or potentially active faults are not known to pass directly through the site. The Alquist-Priolo (AP) mapped Route 247 fault zone is located approximately 1.3 miles to the west but does not trend towards the Site. The Alquist-Priolo (AP) mapped Northern Centinela fault zone is located approximately 3.3 miles to the south and trends towards the Site. It should be noted that ground surface rupture due to a seismic event may occur in areas where no evidence of ground rupture had been previously noted. However, based on the distance to the mapped trace of the faults and the distance to other faults in the vicinity of the site, the potential for damage due to surface rupture due to faulting at the project site is considered low.

### 8.2 SEISMIC SHAKING

The project site is located in southern California, which is considered a seismically active area, and as such, the seismic hazard most likely to impact the site is ground shaking resulting from an earthquake

along one of the known active faults in the region. The seismic design of the project may be performed using seismic design recommendations in accordance with the 2016 California Building Code (CBC).

Preliminary seismic parameters were developed for the project site based on the 2016 California Building Code (CBC) and ASCE 7-10 guidance document. Using the USGS Ground Motion Parameter Online Calculator (<https://earthquake.usgs.gov/designmaps/us/application.php>) based on the following site coordinates: Latitude = 32.729506 degrees, and Longitude = -115.715528 degrees. The earthquake hazard level of the Maximum Considered Earthquake (MCE) is defined in ASCE 7-10 as the ground motion having a probability of exceedance of 2 percent in 50 years. The preliminary seismic design parameters for the project site are presented in Table 3 below.

**Table 3 - Recommended 2016 CBC Seismic Design Parameters**

Design Parameter	Recommended Value	Reference
Seismic Use Group	III	CBC Table 1604.5
Site Class	D	ASCE 7-10 Section 11.4.2
Mapped Spectral Accelerations for short periods, $S_s$	1.50g	ASCE 7-10 Section 11.4.3
Mapped Spectral Accelerations for 1-sec period, $S_1$	0.60g	ASCE 7-10 Section 11.4.3
Short-Period Site Coefficient, $F_a$	1.0	ASCE 7-10 Section 11.4.3
Long-Period Site Coefficient, $F_v$	1.5	ASCE 7-10 Section 11.4.3
<sup>(1)</sup> $MCE_R$ (5% damped) spectral response acceleration for short periods adjusted for site class, $S_{MS}$	1.50g	ASCE 7-10 Section 11.4.3
<sup>(1)</sup> $MCE_R$ (5% damped) spectral response acceleration at 1-second period adjusted for site class, $S_{M1}$	0.90g	ASCE 7-10 Section 11.4.3
Design spectral response acceleration (5% damped) at short periods, $S_{DS}$	1.00g	ASCE 7-10 Section 11.4.3
Design spectral response acceleration (5% damped) at 1-second period, $S_{D1}$	0.60g	ASCE 7-10 Section 11.4.3
Seismic Design Category	D	ASCE 7-10 Section 11.6
<sup>(2)</sup> $MCE_G$ Peak Ground Acceleration adjusted for site class effects, $PGA_M$	0.50g	ASCE 7-10 Section 11.8.3

(1)  $MCE_R$  = Risk-adjusted Maximum Considered Earthquake

(2)  $MCE_G$  = Geometric-mean Maximum Considered Earthquake

### 8.3 LIQUEFACTION AND SEISMICALLY-INDUCED SETTLEMENT

Liquefaction and dynamic settlement of soils can be caused by ground shaking during earthquakes. Dynamic settlement due to earthquake shaking can occur in both dry or unsaturated and saturated sands. Research and historical data indicate that loose, relatively clean granular soils are susceptible to liquefaction and dynamic settlement, whereas the stability of the majority of clayey silts, silty clays and clays is not adversely affected by ground shaking. Liquefaction is generally known to occur in saturated loose cohesionless soils at depths shallower than approximately 50 feet. The potential for liquefaction under the same conditions of ground shaking intensity and duration will decrease for sands that are more well-graded, irregular, gritty, coarser and denser. Also, a pronounced decrease in liquefaction potential will occur with the increase in fine-grained (i.e., silt and clay) content and plasticity of the soil. Idriss and Boulanger (2008) have suggested that soils with plasticity index of greater than 7 may be considered non-liquefiable.

The potential consequences of liquefaction to engineered structures include loss of bearing capacity, buoyancy forces on underground structures (including pipelines), increased lateral earth pressures on retaining walls, and lateral spreading.

The project site is underlain by poorly to moderately consolidated alluvial materials. The subsurface exploration program encountered poorly to moderately consolidated alluvial silt, clay and silty sand, along with a relatively shallow ground water table. A simplified liquefaction analysis was performed using the liquefaction triggering analysis procedure proposed by Boulanger and Idriss (2014) and the CGS SP-117 procedures using the Standard Penetration Test (SPT) data from borings B-1/B-1A and B-6, and historical high groundwater level of 5 feet below ground surface. A peak ground acceleration (PGA) of 0.5g for geometric-mean MCE (see Table 2) and earthquake moment magnitude of 6.5 based on the results of deaggregation analysis using the USGS online tools were used in liquefaction analysis. The analysis results are presented in *Appendix D, Liquefaction Analysis Results* and summarized in the following paragraphs. The analyses indicate that minor liquefaction effects are expected at the site due to presence of few isolated saturated medium dense sand layers present between depths of 15 and 50 feet bgs. Secondary effects of liquefaction, including seismic settlement and lateral spreading are discussed below.

- **Seismic Settlement:** Seismically-induced ground settlement can occur with or without liquefaction which results from densification of loose soils as a result of strong seismic ground shaking. Seismic settlement includes both settlement of liquefied soil layers and settlement of non-liquefied, unsaturated, loose sandy sediments. The methods by Ishihara and Yoshimine (1992) to were used estimate liquefaction-induced seismic settlement and Pradel (1998) to estimate dry or unsaturated seismic settlement. The analyses indicate that the site is not susceptible to liquefaction. However, the total seismic settlement expected at the site is on the order of ¼-inch.
- **Lateral Spreading:** Seismically-induced lateral spreading involves primarily lateral movement of earth materials due to ground shaking in conjunction with liquefaction. Lateral spreading can manifest as near-vertical cracks with predominantly horizontal movement of the soil mass involved towards an adjacent open slope face. Lateral spreading occurs when there is widespread liquefaction and a gentle slope, or a free face toward which lateral spreading may occur. The potential for lateral spreading in the area adjacent to the canal free face was analyzed using data from boring B-1/B-1A and the method proposed by Zhang et al. (2004).

The results indicate low potential for lateral spreading due to absence of widespread liquefaction and relatively shallow depth of the canal compared to the depth of liquefiable soil layers.

#### 8.4 LANDSLIDES AND SLOPE INSTABILITY

There are no high or steep natural slopes on or in close proximity to the project site. Based on the investigation, there appears to be no indications of landslides or deep-seated instability at the site. It is NV5's opinion that the potential damage to the planned facilities due to landsliding or slope instability is considered low.

#### 8.5 SUBSIDENCE

The Imperial Valley is a region generally known for historic ground subsidence. The subsidence has been attributed to regional geologic processes and to fluid withdrawal associated with geothermal production. Most of the subsidence is tectonic in nature and the broad Salton Trough basin has been subsiding for at least the past 35 million years. Historic soil subsidence due to groundwater withdrawal associated with geothermal production has also been documented. The subsidence occurs when groundwater (near the surface or in a deep aquifer) is lowered past its historical level. This occurrence results in an increase of effective stress within a soil layer which typically translates into additional soil consolidation. Due to the depth of the reservoir, subsidence is not localized. Considering the distance to the geothermal production areas to the project site, and that ground subsidence in the Imperial Valley is occurring on a regional and not local level ground subsidence at the site is not expected to create significant differential settlement conditions. Therefore, potential for damaging localized differential settlement from fluid withdrawal subsidence is considered low.

#### 8.6 TSUNAMIS, INUNDATION SEICHES, AND FLOODING

The site and surrounding areas are at an approximate elevation of 3 to 21 feet below mean sea level, the site is approximately 92 miles from the Gulf of California. Therefore, tsunamis (seismic sea waves) are not considered a hazard at the site.

The site is not located near to or downslope of, any large body of water that could affect the site in the event of an earthquake-induced failure or seiche (oscillation in a body of water due to earthquake shaking). The Salton Sea is located approximately 25 miles to the north of the site; therefore, seiches are not considered a hazard at the site.

#### 8.7 EXPANSIVE SOILS

Improvements including foundations and slabs in contact with earth materials with a high potential for expansion can be expected to be subject to distress based on the potential for volume change associated with highly expansive soil. Soils such as these should not be relied upon for foundation bearing.

The project site is underlain predominantly by poorly to moderately consolidated alluvial materials consisting of sandy silt to clay, silty sand and poorly-graded sand with silts. Three tested samples of the near-surface silt and clay soils indicate medium to high expansion potential with an Expansion Index (EI) of 54 to 106. These materials are generally considered unsuitable for use as backfill for

structure foundations, retaining walls or pipe bedding. Since site grading will redistribute on-site soils, potential expansive soil properties should be verified at the completion of rough grading.

## 9.0 CONCLUSIONS AND DESIGN RECOMMENDATIONS

### 9.1 GENERAL

Based on the available geologic data, known active or potentially active faults with the potential for surface fault rupture are not known to exist beneath the site. Accordingly, the potential for surface rupture at the site due to faulting is considered low during the design life of the proposed structure. Although the site could be subjected to strong ground shaking in the event of an earthquake, this hazard is common in southern California and the effects of ground shaking can be mitigated if the structure is designed and constructed in conformance with current building codes and engineering practices.

The near-surface soils in the upper 3 to 5 feet were found to be generally desiccated and considered moderately compressible. The near-surface soils have an expansion potential that ranges from medium to high. These soils are considered unsuitable for re-use as compacted fill and backfill. To provide a uniform support for the new structures and surface improvements, it is recommended that these materials be overexcavated and replaced with properly compacted, non-expansive granular fill.

Based on the results of field exploration, laboratory testing, and engineering evaluation and analyses, the proposed construction is considered geotechnically feasible, provided the recommendations contained herein are incorporated into the project plans and specifications and implemented during construction.

### 9.2 EARTHWORK AND GRADING

Site grading should be performed in accordance with the following recommendations and the *Typical Earthwork Guidelines* provided in *Appendix E*. In the event of conflict, the recommendations presented herein supersede those of *Appendix E*.

- Clearing and Grubbing: Prior to grading, the project area should be cleared of significant surface vegetation, demolition rubble, trash, pavement, debris, etc. Any buried organic debris or other unsuitable contaminated material encountered during subsequent excavation and grading work should also be removed. Removed material and debris should be properly disposed of offsite. Holes resulting from removal of buried obstruction which extend below finished site grades should be filled with properly compacted soils. Any utilities within the footprint of planned structural improvements should be appropriately abandoned.
- Site Grading: Areas to receive surface improvements or fill soils should be treated as follows:
  - Removals Below Proposed New Structures: To provide a uniform bearing condition below the new structures and surface improvements, the existing soils underlying the proposed structures should be completely excavated to a minimum depth of 3 feet below the bottom of foundations. The excavation should extend laterally a distance of at least 5 feet beyond the footprint of the proposed structure. The soils exposed in the bottom of the excavation should be moisture conditioned and uniformly recompacted to at least

90 percent of the soils maximum density (based on ASTM D1557). A cut-fill transition condition should not be allowed underlying proposed structures.

- Excavatability: Based on the subsurface exploration, it is anticipated that the on-site soils can be excavated by modern conventional heavy-duty excavating equipment in good operating condition.
- Structural Fill Placement: Areas to receive fill and/or surface improvements should be scarified to a minimum depth of 6 inches, brought to near-optimum moisture conditions, and compacted to at least 90 percent relative compaction, based on laboratory standard ASTM D1557. Fill soils should be brought to within 2 percent over optimum moisture content and compacted in uniform lifts to at least 90 percent relative compaction (ASTM D1557). Rocks with a maximum dimension greater than 4 inches should not be placed in the upper 3 feet of pad grade. The optimum lift thickness to produce a uniformly compacted fill will depend on the size and type of construction equipment used. In general, fill should be placed in uniform lifts not exceeding 8 inches in loose thickness. Placement and compaction of fill should be observed and tested by the geotechnical consultant.
- Graded Slopes: Graded slopes should be constructed at a gradient of 2:1 (H:V) or flatter. To reduce the potential for surface runoff over slope faces, cut slopes should be provided with brow ditches and berms should be constructed at the top of fill slopes.
- Paved Areas, Flatwork and Trash Enclosures: The soils in proposed paved areas, flatwork, and trash enclosures should be excavated to a minimum depth of one (1) foot below the proposed subgrade elevation, moisture conditioned, and uniformly recompact to at least 90 percent of the soils maximum dry density (based on ASTM D1557). This treatment should extend a horizontal distance of at least one (1) foot beyond the outside perimeter.
- Import Soils: Import soils should be sampled and tested for suitability by NV5 prior to delivery to the site. Imported fill materials should consist of clean granular soils free from vegetation, debris, or rocks larger than 3 inches in maximum dimension. The Expansion Index value should not exceed a maximum of 20 (i.e., essentially non-expansive).

## 9.3 TEMPORARY EXCAVATIONS AND SHORING

Temporary, shallow excavations with vertical side slopes less than 4 feet high will generally be stable, although there is a potential for localized sloughing. In these soil types, vertical excavations greater than 4 feet high should not be attempted without proper shoring to prevent local instabilities. Stockpiled (excavated) materials should be placed no closer to the edge of a trench excavation than a distance defined by a line drawn upward from the bottom of the trench at an inclination of 1H:1V, but no closer than 4 feet. All trench excavations should be in accordance with Cal-OSHA regulations. For planning purposes, the native soil materials may be considered as Type B, as defined in the current Cal-OSHA soil classification.

Although not anticipated, in the event of possible applicability, temporary shoring may be accomplished by several methods including: hydraulic shores and trench plates; trench boxes; And

soldier piles and lagging. For vertical excavations less than about 15 feet in height, cantilevered shoring may be used. Cantilevered shoring may also be used for deeper excavations; however, the total deflection at the top of the wall should not exceed one-inch. Therefore, shoring of excavations deeper than about 15 feet may need to be accomplished with the aid of tied back earth anchors. The excavation support system should be designed to resist lateral earth pressures of the soil and hydrostatic pressures. Preliminary design of cantilevered temporary shoring, a triangular distribution of lateral earth pressure may be used. It may be assumed that the subgrade soils, with a level surface behind the cantilevered shoring, will exert an equivalent fluid pressure of 37 pcf.

Tied-back or braced shoring should be designed to resist a trapezoidal distribution of lateral earth pressure. The recommended pressure distribution, for the case where the grade is level behind the shoring, is illustrated in the following diagram with the maximum pressure equal to  $36H$  in psf, where  $H$  is the height of the shored wall in feet.

Any surcharge (live, including traffic, or dead load) located within a 1H:1V plane drawn upward from the base of the shored excavation should be added to the lateral earth pressures. The vertical loads imposed by existing structures, if any, should be determined by the structural engineer. The lateral load contribution of a uniform surcharge load located across the 1:1 (H:V) zone behind the excavation may be calculated in accordance with *Figure 5, Lateral Surcharge Loads*. Lateral load contributions of surcharges located at a distance behind the shored wall should be provided by NV5 once the load configurations and layouts are known. As a minimum, a 2-ft equivalent soil surcharge is recommended to account for nominal construction loads.

The actual shoring design should be provided by a registered civil engineer in the State of California experienced in the design and construction of shoring under similar conditions. Once the final excavation and shoring plans are complete, the plans and the design should be reviewed by NV5 for conformance with the design intent and geotechnical recommendations. The shoring system should further satisfy requirements of Cal-OSHA.

## 9.4 DEWATERING

Groundwater was encountered at depths between approximately 9 to 19.1 feet below the existing ground surface. The groundwater table is subject to fluctuations in response to a number of factors. If

necessary, the actual means and methods of any dewatering scheme should be established by a contractor with local experience. It is important to note that temporary dewatering, if necessary, will require a permit and plan that complies with RWQCB regulations. If excessive water is encountered, NV5 should be contacted to provide additional recommendations for temporary construction dewatering. Any cases of localized seepage or heavy precipitation should be monitored during construction. Based on the subsurface exploration the onsite soils maybe considered to be relatively permeable.

## 9.5 TRENCH BOTTOM STABILITY

The bottom of onsite excavations will likely expose poorly to moderately consolidated alluvial silt, lean clay, silty sand and poorly-graded sand. As long as excavations do not extend below the water table, these soils should provide a suitable base for construction of pipelines. For the design of flexible conduits, a modulus of soil reaction ( $E'$ ), of 400 pounds per square inch is recommended. If these soils become wet or saturated they may be prone to settlement due to construction activities such as placement and compaction of backfill soils. Buried improvements underlain by these soils could also be damaged or subjected to unacceptable settlement due to subsidence of these soils. If wet or unusually soft conditions are encountered in the trench bottom, the bottom of the excavations will need to be stabilized. A typical stabilization method includes overexcavation of the soft or saturated soil and replacement with properly compacted fill, gravel or lean concrete to form a "mat" or stable working surface in the bottom of the excavation. There are other acceptable methods that can be implemented to mitigate the presence of compressible soils or unstable trench bottom conditions, and specific recommendations for a particular alternative can be discussed based on the actual construction techniques and conditions encountered.

## 9.6 BACKFILL PLACEMENT AND COMPACTION

The majority of the on-site soils should generally be suitable for use as trench backfill material if free of deleterious materials and brought to near-optimum moisture conditions (either by wetting or drying as-necessary). Trench backfill should be compacted in uniform lifts (not exceeding 6 inches in compacted thickness) by mechanical means to at least 90 percent relative compaction (ASTM D1557). There should be sufficient clearance along the side of the utility pipe or line to allow for compaction equipment. The pipe bedding shall be compacted under the haunches and alongside the pipe.

Imported backfill should consist of granular, non-expansive soil with an Expansion Index (EI) of 20 or less and should not contain any contaminated soil, expansive soil, debris, organic matter, or other deleterious materials. The Sand Equivalent (SE) of the imported material shall be 20 or greater. Import material should be evaluated for suitability by the geotechnical consultant prior to transport to the site.

The upper 12 inches of subgrade soil and all rock base should be compacted to at least 95 percent. The moisture content of the backfill should be maintained within 2 percent of optimum moisture content during compaction. All backfill should be mechanically compacted. Flooding or jetting is not recommended and should not be allowed.

## 9.7 BUILDING AND SUBSTATION FOUNDATIONS

Foundations for proposed building and substation structures should be founded entirely on at least 3 feet of compacted essentially non-expansive granular fill prepared in accordance with Section 8.2. Recommendations for the design and construction of foundation system are presented below.

### 9.7.1 Design Parameters

Recommended shallow foundation design parameters are presented in Table 4. Footings should be designed and reinforced in accordance with the recommendations of the structural engineer and should conform to the latest edition of the California Building Code.

**Table 4**  
**Geotechnical Design Parameters For Shallow Foundations**

<b>Foundation Dimensions</b>	<p>Continuous or spread foundations at least 12 inches in width and embedded at least 18 inches below the lowest adjacent grade.</p> <p>Concrete mat slabs with a minimum thickness of 12 inches should be founded a minimum of 24 inches below the lowest adjacent grade.</p>
<b>Allowable Bearing Capacity (dead-plus-live load)</b>	<p>2,000 pounds per square foot (psf), which may be increased by 300 psf for each additional foot of width and by 100 psf for each additional foot of depth to a maximum of 4,000 psf. This assumes that foundations are founded on at least 3 feet of essentially non-expansive granular fill.</p> <p>A one-third (1/3) increase is allowed for wind or seismic loads.</p>
<b>Reinforcement</b>	Reinforce in accordance with requirements as provided by the project Structural Engineer.
<b>Allowable Coefficient of Friction</b>	<p>0.30</p> <p>0.10 in the event a vapor barrier is used.</p>
<b>Allowable Lateral Passive Resistance (Equivalent Fluid Pressure)</b>	<p>250 pounds per cubic foot (pcf) per foot of depth.</p> <p>A one-third (1/3) increase in passive resistance value may be used for wind and seismic loads.</p> <p>The total allowable lateral resistance may be taken as the sum of the frictional resistance and the passive resistance, provided that the passive bearing resistance does not exceed one-half (1/2) of the total allowable lateral passive resistance.</p>

Note: The above parameters assume level ground or sloping no steeper than 5H:1V.

### 9.7.2 Settlement

Estimated settlements will depend on the foundation size and depth, and the loads imposed and the allowable bearing values used for design. For preliminary design purposes, the total static settlement for foundations loaded to accordance with the allowable bearing capacities recommended above is estimated to be less than 1 inch. Differential static settlements are anticipated to be 0.5 inch or less.

### 9.7.3 Foundation Observation

To verify the presence of satisfactory materials at design elevations, footing excavations should be observed to be clean of loosened soil and debris before placing steel or concrete and probed for soft areas. If soft or loose soils or unsatisfactory materials are encountered, these materials should be removed and may be replaced with a two-sack, sand-cement slurry or structural concrete. Footing excavations should be deepened as necessary to extend into satisfactory bearing materials; however, NV5 should be notified to approve the proposed change.

### 9.7.4 Interior Concrete Slabs-on-Grade

Interior concrete slabs-on-grade may be supported at grade on compacted fill with very low to low expansion potential. For design of these concrete slabs, a modulus of subgrade reaction (k) of 150 pci may be used. Floor slabs should be designed and reinforced in accordance with the structural engineer's recommendations. NV5 recommends that interior floor slabs be at least 4 inches thick with a water cement ratio of 0.50 or less. Near surface groundwater is not expected and groundwater is not anticipated to adversely impact the structural performance of the floor slabs. However, in areas where slabs will be covered with moisture-sensitive flooring, it is common practice to place a capillary break consisting of at least 4 inches of free draining crushed gravel on the finished subgrade soil that, in turn, is overlain by a flexible sheet membrane, such as Stego Wrap™, Moistop Plus™, or an equivalent meeting the requirements of ASTM E1745-09, that serves as a water and/or moisture vapor retarder. The crushed gravel should be graded so that 100 percent passes the 1-inch sieve and less than 5 percent passes the No. 4 sieve. Care should be taken to properly place, lap, and seal the membrane in accordance with the manufacturer's recommendations to provide a vapor tight barrier. Tears and punctures in the membrane should be completely repaired prior to placement of concrete. The upper 12 inches of subgrade soil located below the vapor retarder should be moisture-conditioned within 2 percent over the optimum moisture content, and compacted to a minimum of 90 percent relative compaction (ASTM D1557).

At a minimum, slabs should be reinforced with No. 4 reinforcing bars spaced at 18 inches on-center, each way, placed in the middle one-third of the section, to help control shrinkage cracking of concrete. Reinforcement should be properly placed and supported on "chairs". Welded wire mesh is not recommended. The concrete reinforcement and joint spacing should conform to the minimum requirements of the American Concrete Institute (ACI) section 302.1R and established by the project structural engineer.

### 9.7.5 Exterior Concrete Slabs-on-Grade

Exterior concrete flatwork should have a minimum concrete thickness of 4 inches. Concrete slabs should be supported on at least 4 inches of Class 2 aggregate base compacted to at least 95 percent of the maximum dry density. The upper 12 inches of subgrade soil located below the aggregate base

should be moisture-conditioned within 2 percent over the optimum moisture content, and recompacted to a minimum of 90 percent relative compaction (ASTM D1557).

The driveway slab areas and connecting sidewalks should have a minimum concrete thickness of 6 inches. The driveway concrete slab should be underlain by at least 6 inches of Class 2 aggregate base compacted to at least 95 percent of the maximum dry density. The upper 12 inches of subgrade soil located below the aggregate base should be reconditioned to achieve a moisture content within 2 percent over the optimum moisture content, and recompacted to a minimum of 95 percent relative compaction (ASTM D1557).

For exterior concrete flatwork, it is recommended that narrow strip concrete slabs, such as sidewalks, be reinforced with at least No. 3 reinforcing bars placed longitudinally at 36 inches on-center. Wide exterior slabs should be reinforced with at least No. 3 reinforcing bars placed 36 inches on-center, each way. The reinforcement should be extended through the control joints to reduce the potential for differential movement. Control joints should be constructed in accordance with recommendations from the structural engineer or architect.

## 9.8 SOLAR ARRAY FOUNDATIONS

Solar array panels and attached devices may be supported on short driven steel posts or drilled concrete piers. Preliminary design parameters and recommendations for solar array foundations provided in the following sections.

### 9.8.1 Driven Steel Posts

Preliminary axial and lateral pile capacities of W6x9 and W6x15 driven steel posts embedded at depths of 6, 8 and 10 feet below ground surface are presented in Table 5. Due to corrosive nature of native soils, special provisions for corrosion protection of the steel posts will be required.

**Table 5 – Preliminary Axial and Lateral Capacities of Driven Steel Posts**

Parameter	W6x9 Driven Steel Post			W6x15 Driven Steel Post		
Specified Embedment Depth (ft)	6	8	10	6	8	10
Height Above Ground (ft)	4	4	4	4	4	4
Total Length (ft)	10	12	14	10	12	14
Allowable Axial Capacity (kips) for Factor of Safety, FS = 2.5	4.0	5.3	6.6	4.9	6.5	8.1
Allowable Uplift Capacity (kips) for Factor of Safety, FS = 2.5	2.8	3.8	4.7	3.4	4.6	5.7
Lateral Capacity for 1/2-inch Free- Head Deflection (kips)	1.4	1.4	1.4	2.2	2.2	2.2
Maximum Bending Moment (ft-kips)29.1	6.6	6.6	6.6	10.3	10.3	10.3
Depth to Maximum Bending Moment from Top of Post (ft)	5.0	5.0	5.0	5.15	5.15	5.15

## 9.8.2 Drilled Concrete Piers

Equation 18-1 in Section 1807.3.2.1 of the 2016 California Building Code provides the formula for minimum embedment depth of a drilled concrete post required to resist lateral loads where no lateral constraint is present at or above the ground surface. The formula for the minimum embedment depth is as follows:

$$d = 0.5 A \{1 + [1 + (4.36 h/A)]^{1/2}\}$$

where:

$d$  = Embedment depth in *feet* but not over 12 feet for purpose of computing lateral pressure.

$A = 2.34 P / (S_1 b)$

$P$  = Applied lateral force in *pounds*.

$S_1$  = Allowable lateral soil bearing pressure as given in Section 1806.2 based on a depth of one-third the depth of embedment in *pounds per square foot (psf)*.

$b$  = Diameter of concrete pier in *feet*.

$h$  = Vertical distance in *feet* from ground surface to point of application of “ $P$ ”.

The short pier foundation may be designed using an allowable soil bearing pressure of 2,000 psf when embedded in the native soils.

## 9.9 RETAINING WALLS

Retaining walls should be designed in accordance with the following recommendations and design parameters presented herein.

- Bearing Capacity - The proposed wall may be supported on continuous footings bearing on dense natural soils or properly compacted fill soils at a minimum depth of 18 inches beneath the lowest adjacent grade. At this depth, footings may be designed for an allowable soil-bearing pressure of 2,000 psf. This value may be increased by one-third for loads of short duration, such as wind or seismic forces.
- Lateral Earth Pressures - Based on laboratory test results and encountered soil conditions, the recommended lateral earth pressures for preliminary design of flexible retaining walls supported on shallow foundations are summarized in the following Table 6.

**Table 6 - Recommended Lateral Earth Pressures**

Parameter	Recommended Values				
	Level Backfill	5H:1V Slope	4H:1V Slope	3H:1V Slope	2H:1V Slope
Static Active Earth Pressure ( $P_a$ )	37H	43H	45H	49H	62H
Static At-Rest Earth Pressure ( $P_o$ )	60H	72H	75H	79H	87H
Seismic Earth Pressure ( $P_e$ )	23H	26H	27H	30H	38H
Coefficient of Friction ( $\mu$ ) for Lateral Resistance of Footing	0.35	N/A	N/A	N/A	N/A
Passive Earth Pressure ( $P_p$ ) for Lateral Resistance of Footing	250H	N/A	N/A	N/A	N/A

Notes:

1. All values of height (H) are in feet (ft) and pressure (P) in pounds per square feet (psf).
2. Seismic earth pressure ( $P_e$ ) is in addition to the static active or at-rest pressure,  $P_a$  and  $P_o$  which should be distributed as an inverted triangle along the wall height and the resultant of this pressure is an increment of force which should be applied to the back of the wall in the upper one-third ( $1/3$ ) of the wall height and may also be applied as a reduction of force to the front of the wall in the upper one-third ( $1/3$ ) of the footing depth.
3. The above pressure values do not include hydrostatic pressures that might be caused by groundwater or water trapped behind the structure.
4. The pressures listed in the table were based on the assumption that backfill soils will be compacted to 90 percent of maximum dry density (per ASTM D1557).
5. The coefficient of friction ( $\mu$ ) should be applied to dead normal (buoyant) loads when evaluating the sliding frictional resistance.
6. A resistance factor of 0.5 has been applied to the passive earth pressure and may be combined with the sliding frictional resistance using a resistance factor of 0.80. Neglect the upper 6 inches for passive pressure unless the surface is contained by a pavement or a slab. The passive earth pressure should not exceed a maximum value of 3,000 psf.
7. In addition to the above-mentioned pressures, retaining walls must be designed to resist horizontal pressures that may be generated by surcharge loads applied at the ground surface such as from uniform loads or vehicle loads. Figure 5 may be used to evaluate these surcharge loads.

- **Drainage and Waterproofing** - Retaining walls should be properly drained, and if desired, appropriately waterproofed. Adequate backfill drainage is essential to provide a free-drained backfill condition and to reduce the potential for the development of hydrostatic pressure buildup behind walls. Drainage behind the retaining walls may be provided with geosynthetic drainage composite such as TerraDrain, MiraDrain, or equivalent, placed continuously along the back of the wall and connected to a 4-inch-diameter perforated pipe. The pipe should be sloped at least 2 percent and surrounded by 3 cubic feet per foot of  $3/4$ -inch crushed rock wrapped in suitable non-woven filter fabric (Mirafi 140N or equivalent) or Caltrans Class 2 permeable granular filter materials without filter fabric. The crushed rock should meet the requirements defined in Section 200-1.2 of the latest edition of the Standard Specification for

Public Works Construction (Greenbook). These drains should be connected to an adequate discharge system.

In lieu of a perforated drainage pipe and connection to an existing drainage system, weep holes or open vertical masonry joints may be provided in the lowest row of block exposed to the air to reduce the buildup of hydrostatic pressure behind the wall. Weep holes should be a minimum of three inches in diameter and provided at intervals of at least every six feet along the wall. Open vertical masonry joints should be provided at a minimum of 32-inch intervals. A continuous gravel fill, a minimum of one cubic foot per foot should be placed behind the weep holes or open masonry joints. The gravel should be wrapped in filter fabric (Mirafi 140N or equivalent). To prevent efflorescence at the face of the wall, the wall may also be appropriately waterproofed. Waterproofing treatments and alternative, suitable wall drainage products are available commercially. Design of waterproofing and its protection during construction should be addressed by the project design professional.

- Retaining Wall Backfill Compaction - Retaining wall backfill material should be non-expansive (E.I. of 20 or less) and free draining. Backfill should be brought to near-optimum moisture conditions and compacted by mechanical means to at least 90 percent relative compaction (ASTM D1557). Care should be taken when using compaction equipment in close proximity to retaining walls so that the walls are not damaged by excessive loading.

## 9.10 PAVEMENTS

Design of asphalt concrete pavement sections depends primarily on support characteristics (strength) of soil beneath the pavement section and on cumulative traffic loads within the service life of the pavement. Strength of the pavement subgrade is represented by R-value test data. R-value tests were performed on representative samples of the near-surface soil. The results yielded R-values ranging from 5 (lean clay) and 57 (silty sand). A summary of the test is included in Appendix C.

Traffic loads within service life of a pavement are represented by a Traffic Index (TI), which is calculated based on anticipated traffic loads and on the projected number of load repetitions during the design life of the pavement. The design TI value should be verified by the project Civil/Traffic Engineer prior to construction.

Preliminary pavement section recommendations were developed using a design R-value of 5 and maximum Traffic Index (TI) = 6 assumed for light auto parking and drive lanes and TI = 8 for fire lanes. Based on these design parameters, analysis in accordance with California Department of Transportation (Caltrans) Highway Design Manual, and assuming compliance with site preparation recommendations, NV5 recommends the flexible and rigid structural pavement sections presented in the following Table 7.

**Table 7 - Recommended Pavement Sections (Design R-value = 5)**

Location	Alternative 1		Alternative 2	
	Hot-Mix Asphalt (HMA)	Aggregate Base (AB)	Jointed Plain Portland Cement Concrete (JPCP)	Aggregate Base (AB)
Light Auto Parking and Drive Lanes	4.0	12.0	5.0	4.0
Fire Lanes	8.0	12.0	6.0	4.0

Assuming that the near-surface on-site soils will be thoroughly mixed and compacted during grading operations, it is recommended that R-value testing be performed on representative soil samples after rough grading operations on the upper 2 feet to confirm applicability of the above pavement sections. If the paved areas are to be used during construction, or if the type and frequency of traffic is greater than assumed in the design, the pavement section should be re-evaluated for the anticipated traffic.

The upper 12 inches of subgrade soils should be compacted to a minimum dry density of 95 percent of the material's maximum dry density as determined by the ASTM D1557 test procedure. The aggregate base should conform to Class II aggregate base in accordance with Section 400.2.3 of the 2009 Regional Supplement to Greenbook Standard Specifications for Public Works Construction. The base course should also be compacted to a minimum dry density of 95 percent. Field and laboratory testing should be used to check compaction, aggregate gradation, and compacted thickness.

The asphalt pavement should be compacted to 95 percent of the unit weight as tested in accordance with the Hveem procedure (ASTM D1560). The maximum lift thickness should be 4.0 inches. The asphalt material shall conform to Type III, Class B2 or B3 of the Standard Specifications for Public Works Construction and the supplement. An approved mix design should be submitted 30 days prior to placement. The mix design should include proportions of materials, maximum density and required lay-down temperature range. Field and lab testing should be used to verify oil content, aggregate gradation, compaction, compacted thickness, and lay-down temperature.

Control joints are required for the Portland cement concrete pavement (rigid) at a maximum of 15 feet spacing each way and should be constructed immediately after concrete finishing.

The performance of pavements is highly dependent upon providing positive surface drainage away from the edge of the pavement. The ponding of water on or adjacent to pavement areas will likely cause failure of the subgrade and resultant pavement distress. Where planters are proposed, the perimeter curb should extend at least 6 inches below the subgrade elevation of the adjacent pavement. In addition, experience indicates that even with these provisions, a saturated subgrade condition can develop as a result of increased irrigation, landscaping and surface runoff. A subdrain system should be considered along the perimeter of pavement subgrade areas to reduce the potential of this condition developing. The subdrain system should be designed to intercept irrigation water and surface runoff prior to entry into the pavement subgrade and carry the water to a suitable outlet.

## 9.11 SOIL CORROSION

The corrosion potential of the on-site materials to steel and buried concrete was evaluated. Laboratory testing was performed on selected soil samples to evaluate pH, minimum resistivity, and chloride and soluble sulfate content. Table 8 below, presents the results of the corrosivity testing.

**Table 8 - Corrosivity Test Results**

Test Location	Depth (feet)	Material Type	Percent Finer Than No. 200	pH	Minimum Resistivity (ohm-cm)	Water Soluble Sulfate Content (ppm)	Water Soluble Chloride Content (ppm)
B-3	3 - 5	Silty Sand	40.4	9.3	820	420	130
B-6	1 - 3	Fat Clay	Not Tested	8.5	120	2310	2140

General recommendations to address the corrosion potential of the on-site soils are provided below. If additional recommendations are desired, it is recommended that a corrosion specialist be consulted.

Caltrans Corrosion Guidelines dated March 2018 considers a site to be corrosive if one or more of the following conditions exist for the representative soil samples taken at the site:

*Chloride concentration is 500 ppm or greater, sulfate concentration is 1500 ppm or greater, or the pH is 5.5 or less*

Based on experience and the Caltrans Corrosion Guidelines, some of the site soils are considered corrosive to steel and concrete foundation elements based on sulfate and chloride test results.

As indicated in the 2006 edition (second edition) of "Corrosion Basics - An Introduction", a general guideline for soil resistivity and corrosion-severity ratings is presented in Table 9 below.

**Table 9 - Corrosivity Test Results**

Soil Resistivity	Corrosivity
<1,000 ohm-cm	Extremely Corrosive
1,000 to 3,000 ohm-cm	Highly Corrosive
3,000 to 5,000 ohm-cm	Corrosive
5,000 to 10,000 ohm-cm	Moderately Corrosive
10,000 to 20,000 ohm-cm	Mildly Corrosive
>20,000 ohm-cm	Essentially Noncorrosive

Soil resistivity is not the only parameter affecting the risk of corrosion damage; and a high soil resistivity will not guarantee the absence of serious corrosion. For example, the American Water Works Association (AWWA) has developed a numerical soil-corrosivity scale, applicable to cast-iron alloys. The soil resistivity test results suggest the potential for soils to be extremely corrosive to ferrous pipes.

Any imported soils should be evaluated for corrosion characteristics if they will be in contact with buried or at-grade structures and appropriate mitigation measures should be included in the structure design. It is recommended that a corrosion specialist be contacted to determine if mitigation measures are necessary.

## 10.0 DESIGN REVIEW AND CONSTRUCTION MONITORING

Geotechnical review of plans and specifications is of paramount importance in engineering practice. The poor performance of many pipelines has been attributed to inadequate geotechnical review of construction documents. Additionally, observation and testing of the backfill, subgrade and base will be important to the performance of the proposed improvements. The following sections present NV5's recommendations relative to the review of construction documents and the monitoring of construction activities.

### 10.1 PLANS AND SPECIFICATIONS

The design plans and specifications will be reviewed and approved by NV5 prior to construction, as the geotechnical recommendations may need to be re-evaluated in the light of the actual design configuration. This review is necessary to evaluate whether the recommendations contained in this report and future reports have been properly incorporated into the project plans and specifications.

### 10.2 CONSTRUCTION MONITORING

Site preparation, removal of unsuitable soils, assessment of imported fill materials, backfill placement, and other earthwork operations should be observed and tested. The substrata exposed during the construction may differ from that encountered in the test borings. Continuous observation by a representative of NV5 during construction allows for evaluation of the soil/rock conditions as they are encountered and allows the opportunity to recommend appropriate revisions where necessary.

## 11.0 LIMITATIONS

The recommendations and opinions expressed in this report are based on NV5's review of background documents and on information developed during this study. It should be noted that this study did not evaluate the possible presence of hazardous materials on any portion of the site. More detailed limitations of this geotechnical study are presented in the GBC's information bulletin in *Appendix F*.

Due to the limited nature of the field explorations, conditions not observed and described in this report may be present on the site. Uncertainties relative to subsurface conditions can be reduced through additional subsurface exploration. Additional subsurface evaluation and laboratory testing can be performed upon request. It should be understood that conditions different from those anticipated in this report may be encountered during the proposed structure construction operations.

Site conditions, including ground-water level, can change with time as a result of natural processes or the activities of man at the subject site or at nearby sites. Changes to the applicable laws, regulations, codes, and standards of practice may occur as a result of government action or the broadening of knowledge. The findings of this report may, therefore, be invalidated over time, in part or in whole, by changes over which NV5 has no control.

NV5's recommendations for this site are, to a high degree, dependent upon appropriate quality control of subgrade preparation, fill/backfill placement, etc. Accordingly, the recommendations are made contingent upon the opportunity for NV5 to observe grading operations and foundation excavations for the proposed construction. If parties other than NV5 are engaged to provide such services, such parties must be notified that they will be required to assume complete responsibility as the geotechnical engineer of record for the geotechnical phase of the project by concurring with the recommendations in this report and/or by providing alternative recommendations.

This document is intended to be used only in its entirety. No portion of the document, by itself, is designed to completely represent any aspect of the project described herein. NV5 should be contacted if the reader requires additional information or has questions regarding the content, interpretations presented, or completeness of this document.

NV5 has endeavored to perform this study using the degree of care and skill ordinarily exercised under similar circumstances by reputable geotechnical professionals with experience in this area in similar soil/rock conditions. No other warranty, either expressed or implied, is made as to the conclusions and recommendations contained in this study.

## APPENDIX A

Exploratory Boring Logs

### **Logs of Exploratory Borings**

Bulk and relatively undisturbed drive samples were obtained in the field during our subsurface evaluation. The samples were tagged in the field and transported to our laboratory for observation and testing. The drive samples were obtained using the Modified California Sampler (CAL) and Standard Penetration Test (SPT) samplers as described below.

#### **Modified California Split Spoon Sampler**

The split barrel drive sampler is driven with a 140-pound hammer allowed to drop freely 30 inches in general accordance with ASTM D1587. The number of blows per foot recorded during sampling is presented in the logs of exploratory borings. The sampler has external and internal diameters of approximately 3.0 and 2.4 inches, respectively, and the inside of the sampler is lined with 1-inch-long brass rings. The relatively undisturbed soil sample within the rings is removed, sealed, and transported to the laboratory for observation and testing.

#### **Standard Penetration Test (SPT) Sampler**

The split barrel sampler is driven with a 140-pound hammer allowed to drop freely 30 inches in general accordance with ASTM D1586. The number of blows per foot recorded during sampling is presented in the logs of exploratory borings. The sampler has external and internal diameters of 2.0 and 1.4 inches, respectively. The soil sample obtained in the interior of the barrel is measured, removed, sealed and transported to the laboratory for observation and testing.

## SAMPLE/SAMPLER TYPE GRAPHICS

	AUGER SAMPLE
	STANDARD PENETRATION SPLIT SPOON SAMPLER
	BULK / GRAB SAMPLE
	MODIFIED CALIFORNIA SAMPLER
	SHELBY TUBE SAMPLER
	HQ ROCK CORE SAMPLE
	NQ ROCK CORE SAMPLE

## GROUNDWATER LEVEL GRAPHICS

	WATER LEVEL (during drilling operations)
	WATER LEVEL (immediately after drilling completion)
	WATER LEVEL (additional levels after drilling completion)
	OBSERVED SEEPAGE

## NOTES

- The report and graphics key are an integral part of these logs. All data and interpretations in this log are subject to the explanations and limitations stated in the report.
- Lines separating strata on the logs represent approximate boundaries only. Actual transitions may be gradual or differ from those shown.
- No warranty is provided as to the continuity of soil or rock conditions between individual sample locations.
- Logs represent general soil or rock conditions observed at the point of exploration on the date indicated.
- In general, Unified Soil Classification System (USCS) designations presented on the logs were based on visual classification in the field and were modified where appropriate based on gradation and index property testing.
- Fine grained soils that plot within the hatched area on the Plasticity Chart, and coarse grained soils with between 5 and 12% passing the No. 200 sieve require dual USCS symbols, i.e., GW-GM, GP-GM, GW-GC, GP-GC, GC-GM, SW-SM, SP-SM, SW-SC, SP-SC, SC-SM.
- If sampler is not able to be driven at least 6 inches then Y/X indicates Y number of blows required to drive the identified sampler X inches with a 140 pound hammer falling 30 inches.

## UNIFIED SOIL CLASSIFICATION SYSTEM (ASTM D 2487)

GRAVELS (More than half of coarse fraction is larger than the #4 sieve)	CLEAN GRAVEL WITH <5% FINES	Cu ≥ 4 and 1 ≤ Cc ≤ 3		GW	WELL-GRADED GRAVELS, GRAVEL-SAND MIXTURES WITH LITTLE OR NO FINES
		Cu < 4 and/or 1 > Cc > 3		GP	POORLY-GRADED GRAVELS, GRAVEL-SAND MIXTURES WITH LITTLE OR NO FINES
	GRAVELS WITH 5 TO 12% FINES	Cu ≥ 4 and 1 ≤ Cc ≤ 3		GW-GM	WELL-GRADED GRAVELS, GRAVEL-SAND MIXTURES WITH LITTLE FINES
		Cu < 4 and/or 1 > Cc > 3		GW-GC	WELL-GRADED GRAVELS, GRAVEL-SAND MIXTURES WITH LITTLE CLAY FINES
				GP-GM	POORLY-GRADED GRAVELS, GRAVEL-SAND MIXTURES WITH LITTLE FINES
				GP-GC	POORLY-GRADED GRAVELS, GRAVEL-SAND MIXTURES WITH LITTLE CLAY FINES
	GRAVELS WITH >12% FINES			GM	SILTY GRAVELS, GRAVEL-SILT-SAND MIXTURES
				GC	CLAYEY GRAVELS, GRAVEL-SAND-CLAY MIXTURES
				GC-GM	CLAYEY GRAVELS, GRAVEL-SAND-CLAY-SILT MIXTURES
COARSE GRAINED SOILS (More than half of coarse fraction is smaller than the #4 sieve)	CLEAN SANDS WITH <5% FINES	Cu ≥ 6 and 1 ≤ Cc ≤ 3		SW	WELL GRADED SANDS, SAND-GRAVEL MIXTURES WITH LITTLE OR NO FINES
		Cu < 6 and/or 1 > Cc > 3		SP	POORLY-GRADED SANDS, SAND-GRAVEL MIXTURES WITH LITTLE OR NO FINES
	SAND WITH 5 TO 12% FINES	Cu ≥ 6 and 1 ≤ Cc ≤ 3		SW-SM	WELL-GRADED SANDS, SAND-GRAVEL MIXTURES WITH LITTLE FINES
				SW-SC	WELL-GRADED SANDS, SAND-GRAVEL MIXTURES WITH LITTLE CLAY FINES
		Cu > 6 and/or 1 < Cc > 3		SP-SM	POORLY GRADED SANDS, SAND-GRAVEL MIXTURES WITH LITTLE FINES
				SP-SC	POORLY-GRADED SANDS, SAND-GRAVEL MIXTURES WITH LITTLE CLAY FINES
	SANDS WITH >12% FINES			SM	SILTY SANDS, SAND-GRAVEL-SILT MIXTURES
				SC	CLAYEY SANDS, SAND-GRAVEL-CLAY MIXTURES
				SC-SM	CLAYEY SANDS, SAND-SILT-CLAY MIXTURES
FINE GRAINED SOILS (More than half of material is smaller than the #200 sieve)	SILTS AND CLAYS (Liquid Limit less than 50)			ML	INORGANIC SILTS AND VERY FINE SANDS, SILTY OR CLAYEY FINE SANDS, SILTS WITH SLIGHT PLASTICITY
				CL	INORGANIC CLAYS OF LOW TO MEDIUM PLASTICITY, GRAVELLY CLAYS, SANDY CLAYS, SILTY CLAYS, LEAN CLAYS
				CL-ML	INORGANIC CLAYS-SILTS OF LOW PLASTICITY, GRAVELLY CLAYS, SANDY CLAYS, SILTY CLAYS, LEAN CLAYS
	SILTS AND CLAYS (Liquid Limit greater than 50)			OL	ORGANIC SILTS & ORGANIC SILTY CLAYS OF LOW PLASTICITY
				MH	INORGANIC SILTS, MICACEOUS OR DIATOMACEOUS FINE SAND OR SILT
				CH	INORGANIC CLAYS OF HIGH PLASTICITY FAT CLAYS
				OH	ORGANIC CLAYS & ORGANIC SILTS OF MEDIUM-TO-HIGH PLASTICITY

## GRAIN SIZE

DESCRIPTION	SIEVE SIZE	GRAIN SIZE	APPROXIMATE SIZE
Boulders	>12 in.	>12 in. (304.8 mm.)	Larger than basketball-sized
Cobbles	3 - 12 in.	3 - 12 in. (76.2 - 304.8 mm.)	Fist-sized to basketball-sized
Gravel	coarse 3/4 - 3 in.	3/4 - 3 in. (19 - 76.2 mm.)	Thumb-sized to fist-sized
	fine #4 - 3/4 in.	0.19 - 0.75 in. (4.75 - 19 mm.)	Pea-sized to thumb-sized
Sand	coarse #10 - #4	0.079 - 0.19 in. (2 - 4.75 mm.)	Rock salt-sized to pea-sized
	medium #40 - #10	0.017 - 0.079 in. (0.43 - 2 mm.)	Sugar-sized to rock salt-sized
	fine #200 - #40	0.0029 - 0.017 in. (0.074 - 0.43 mm.)	Four-sized to sugar-sized
Fines	Passing #200	<0.0029 in. (0.074 mm.)	Flour-sized and smaller

## MUNSELL COLOR

NAME	ABBR
Red	R
Yellow Red	YR
Yellow	Y
Green Yellow	GY
Green	G
Blue Green	BG
Blue	B
Purple Blue	PB
Purple	P
Red Purple	RP
Black	N

## ANGULARITY

DESCRIPTION	CRITERIA
Angular	Particles have sharp edges and relatively plane sides with unpolished surfaces
Subangular	Particles are similar to angular description but have rounded edges
Subrounded	Particles have nearly plane sides but have well-rounded edges
Rounded	Particles have smoothly curved sides and no edges

## PLASTICITY

DESCRIPTION	CRITERIA
Non-plastic	A 1/8-in. (3 mm.) thread cannot be rolled at any water content.
Low (L)	The thread can barely be rolled and the lump or thread cannot be formed when drier than the plastic limit.
Medium (M)	The thread is easy to roll and not much time is required to reach the plastic limit. The thread cannot be rerolled after reaching the plastic limit. The lump or thread crumbles when drier than the plastic limit.
High (H)	It takes considerable time rolling and kneading to reach the plastic limit. The thread can be rerolled several times after reaching the plastic limit. The lump or thread can be formed without crumbling when drier than the plastic limit.

## MOISTURE CONTENT

DESCRIPTION	CRITERIA
Dry	Absence of moisture, dusty, dry to the touch
Moist	Damp but no visible water
Wet	Visible free water, usually soil is below groundwater table

## REACTION WITH HYDROCHLORIC ACID

DESCRIPTION	CRITERIA
None	No visible reaction
Weak	Some reaction, with bubbles forming slowly
Strong	Violet reaction, with bubbles forming immediately

## APPARENT/RELATIVE DENSITY - COARSE-GRAINED SOIL

APPARENT DENSITY	SPT-N <sub>60</sub> (#blows/ft)	MODIFIED CALIFORNIA SAMPLER (#blows/ft)	RELATIVE DENSITY (%)
Very Loose	<4	<5	0 - 15
Loose	4 - 10	6 - 15	15 - 35
Medium Dense	11 - 30	16 - 40	35 - 65
Dense	31 - 50	41 - 70	65 - 85
Very Dense	>50	>71	85 - 100

## CONSISTENCY - FINE-GRAINED SOIL

CONSISTENCY	SPT-N <sub>60</sub> (#blows/0.3m)	CRITERIA
Very Soft	<2	Thumb will penetrate soil more than 1 in. (25 mm.)
Soft	2 - 4	Thumb will penetrate soil about 1 in. (25 mm.)
Medium Stiff	5 - 8	Thumb will indent soil about 1/4-in. (6 mm.)
Stiff	8 - 15	Can be imprinted with considerable thumbnail pres.
Very Stiff	15 - 30	Thumb will not indent soil but readily indented with thumbnail
Hard	>30	Thumbnail will not indent soil

## STRUCTURE

DESCRIPTION	CRITERIA
Stratified	Alternating layers of varying material or color with layers at least 1/4-in. (6 mm.) thick, note thickness
Laminated	Alternating layers of varying material or color with layers less than 1/4-in. (6 mm.) thick, note thickness
Fissured	Breaks along definite planes of fracture with little resistance to fracturing
Slickensided	Fracture planes appear polished or glossy, sometimes striated
Blocky	Cohesive soil that can be broken down into smaller angular lumps which resist further breakdown
Lensed	Inclusion of small pockets of different soils, such as small lenses of sand scattered through a mass of clay; note thickness
Homogeneous	Same color and appearance throughout

## CEMENTATION

DESCRIPTION	CRITERIA
Weakly	Crumbles or breaks with handling or slight finger pressure
Moderately	Crumbles or breaks with considerable finger pressure
Strongly	Will not crumble or break with finger pressure

## APPENDIX B

Field Resistivity Test Data

October 5, 2018  
Project No. 118487

Mr. Sean Roy  
NV5  
15092 Avenue of Science, Suite 200  
San Diego, CA 92128

Subject:       Geophysical Evaluation  
                  Westside Canal Project  
                  El Centro, California

Dear Mr. Sean Roy:

In accordance with your authorization, we have performed geophysical survey services pertaining to the proposed Westside Canal Project located south of the intersection of Liebert Road and Mandrapa Road in El Centro, California (Figure 1). The purpose of our services was to collect in-situ electrical resistivity measurements for use in the design and construction of the proposed project. Our services were conducted on September 20 and September 21, 2018. This report presents the survey methodology, equipment used, analysis, and results.

Our scope of services for the project included collection of electrical resistivity data at the site, compilation of the data collected, and preparation of this data report. Specifically, we conducted two crossing, nearly orthogonal resistivity soundings at six locations (R-1 through R-6) onsite for a total of twelve. The roughly north-south trending lines are given an “a” designation (e.g., R-1a) and the roughly west-east lines are given a “b” designation (e.g., R-1b). Figures 1 and 2 illustrate the approximate sounding locations, and Figures 3a and 3b illustrate the conditions in the study area as viewed from the south and west.

The data were collected in general accordance with ASTM G57 using an Advanced Geosciences, Inc. (AGI) MiniSting earth resistivity meter and four steel electrodes in a Wenner configuration. For each of the locations, soil resistance measurements were collected at several electrode spacings, which were designated by your office, along the two lines with the middle of each sounding generally located at a common center point. The stainless-steel electrodes were hammered into place and the soils surrounding the electrodes were moistened with saline water where necessary.

The results of the electrical resistivity survey are presented in Figures 4a through 4c. The measurements collected along each of the soundings are generally consistent (with slight variations) indicating that the subsurface conditions are fairly uniform with respect to apparent resistivity.

The field services and geophysical analyses presented in this report have been conducted in general accordance with current practice and the standard of care exercised by consultants performing similar tasks in the project area. No warranty, express or implied, is made regarding the conclusions presented in this report. Please also note that our evaluation was limited to measuring in-situ apparent soil resistivity at six locations selected by your office. Southwest Geophysics, Inc. should be contacted if the reader has questions regarding the content, interpretations presented, or completeness of this document. This report is intended exclusively for use by the client. Any use or reuse of this report by parties other than the client is undertaken at said parties' sole risk.

We appreciate the opportunity to be of service on this project. Should you have any questions related to this report, please contact the undersigned at your convenience.

Sincerely,

**SOUTHWEST GEOPHYSICS, INC.**

## APPENDIX C

Laboratory Test Results

## SUMMARY OF LABORATORY TEST RESULTS

### In-situ Moisture and Density Tests

The in-situ moisture contents and dry densities of selected samples obtained from the test borings were evaluated in general accordance with the latest version of D2216 and D2937 laboratory test methods. The method involves obtaining the moist weight of the sample and then drying the sample to obtain it's dry weight. The moisture content is calculated by taking the difference between the wet and dry weights, dividing it by the dry weight of the sample and expressing the result as a percentage. The results of the in-situ moisture content and density tests are presented in the following table and on the logs of exploratory borings in Appendix A.

### RESULTS OF MOISTURE CONTENT AND DENSITY TESTS (ASTM D2216 and ASTM D2937)

Sample Location	Moisture Content (percent)	Dry Density (pounds per cubic foot)
Boring 1 @ 3 - 5 feet	20.1	Not Tested
Boring 1 @ 5.5 - 6 feet	26.1	97.7
Boring 1 @ 10 - 11.5 feet	25.8	Not Tested
Boring 1 @ 15 - 16.5 feet	22.1	Not Tested
Boring 1 @ 20 - 21.5 feet	21.8	Not Tested
Boring 1a @ 15 - 16.5 feet	24.3	Not Tested
Boring 1a @ 20 - 21.5 feet	24.8	Not Tested
Boring 1a @ 25 - 26.5 feet	22.5	Not Tested
Boring 1a @ 30 - 31.5 feet	22.1	Not Tested
Boring 1a @ 35 - 36.5 feet	22.7	Not Tested
Boring 1a @ 40 - 41.5 feet	22.4	Not Tested
Boring 1a @ 45 - 46.5 feet	21.4	Not Tested
Boring 1a @ 50 - 51.5 feet	22.4	Not Tested
Boring 1a @ 55 - 56.5 feet	22.0	Not Tested
Boring 1a @ 60 - 61.5 feet	23.1	Not Tested
Boring 1a @ 65 - 66.5 feet	22.0	Not Tested
Boring 1a @ 70 - 71.5 feet	21.3	Not Tested
Boring 1a @ 75 - 76.5 feet	21.2	Not Tested

Sample Location	Moisture Content (percent)	Dry Density (pounds per cubic foot)
Boring 2 @ 6 – 6.5 feet	5.1	102.1
Boring 2 @ 10 – 11.5 feet	27.2	Not Tested
Boring 2 @ 15 - 16.5 feet	27.0	Not Tested
Boring 2 @ 18.5 – 20 feet	21.5	Not Tested
Boring 3 @ 5 – 6.5 feet	8.4	Not Tested
Boring 3 @ 11 – 11.5 feet	20.8	104.2
Boring 3 @ 15 - 16.5 feet	28.8	Not Tested
Boring 3 @ 18.5 - 20 feet	26.0	Not Tested
Boring 4 @ 6 - 6.5 feet	22.3	96.4
Boring 4 @ 10 – 11.5 feet	26.3	Not Tested
Boring 4 @ 16 – 16.5 feet	16.6	104.8
Boring 4 @ 18.5 - 20 feet	22.9	Not Tested
Boring 5 @ 3 – 5 feet	4.6	Not Tested
Boring 5 @ 6 - 6.5 feet	11.2	107.9
Boring 5 @ 10 – 11.5 feet	22.2	Not Tested
Boring 5 @ 18.5 – 20 feet	22.6	Not Tested
Boring 6 @ 1 – 3 feet	8.8	Not Tested
Boring 6 @ 6 – 6.5 feet	24.1	99.5
Boring 6 @ 10 – 11.5 feet	25.4	Not Tested
Boring 6 @ 16 – 16.5 feet	29.1	94.3
Boring 6 @ 20 - 21.5 feet	29.3	Not Tested
Boring 6 @ 26 - 26.5 feet	28.1	Not Tested
Boring 6 @ 30 - 31.5 feet	16.8	Not Tested
Boring 6 @ 35 - 36.5 feet	24.7	Not Tested
Boring 6 @ 40 - 41.5 feet	33.1	Not Tested
Boring 6 @ 45 – 46.5 feet	26.7	Not Tested
Boring 6 @ 50 – 51.5 feet	25.2	Not Tested

## Classification

Soils were visually and texturally classified in general accordance with the Unified Soil Classification System (ASTM D2487). Soil classifications are indicated on the logs of the exploratory borings presented in Appendix A.

## Particle-size Distribution Tests

An evaluation of the grain-size distribution of selected soil samples was performed in general accordance with the latest versions of ASTM D1140 and ASTM D6913 (excluding hydrometer). These test results were utilized in evaluating the soil classifications in accordance with the Unified Soil Classification System. Particle size distribution test results are presented on the laboratory test sheets attached in this appendix.

## Expansion Index Tests

Expansion index tests were performed on samples of the on-site soils. The tests were performed in general accordance with ASTM D4829. The results of the tests are presented below and attached in this appendix.

Location	B-1 @ 3' - 5'	B-2 @ 3' - 5'	B-3/B-5 @ 3' - 5'	B-4 @ 3' - 5'	B-6 @ 1' - 3'
Material Type	Tan Lean CLAY with Sand (CL)	Brown Fat CLAY (CH)	Tan Silty SAND (SM)	Tan Clayey SAND (SC)	Brown Fat CLAY (CH)
Source	Native	Native	Native	Native	Native
Initial Moisture Content, %	10.2	10.2	8.3	7.6	11.6
Final Moisture Content, %	20.5	25.9	16.1	17.3	27.8
Dry Density, pcf	109.7	108.4	116.3	118.6	104.5
Initial Saturation, %	51.3	49.7	49.8	48.8	51.1
Expansion Index	50	106	14	54	106
Potential Expansion	LOW	HIGH	VERY LOW	MEDIUM	HIGH

## Atterberg Limits

Atterberg limits tests were performed in general accordance with ASTM D4318 on selected soil samples. These tests were useful in classification of the soils. Test results are attached in this appendix and summarized below.

Location	B-6 @ 10 – 11.5 ft	B-6 @ 20 – 21.5 ft	B-6 @ 35 – 36.5 ft	B-6 @ 45 – 46.5
Material Type	Fat CLAY (CH)	Fat CLAY (CH)	Lean CLAY with Sand (CL)	Sandy Lean CLAY (CL)
Liquid Limit	75	66	32	34
Plastic Limit	20	19	14	18
Plasticity Index	55	47	18	16

## Thermal Resistivity Tests

Various bulk soil samples were packaged and returned to NV5's in house laboratory for thermal resistivity analysis. The bulk soil samples were placed, remolded and compacted within a 2.4 inch diameter by 6 inch long mold. Testing for thermal resistivity ( $\rho$ ) was completed in general accordance with test methods IEEE 442 and ASTM D5334. The results of the laboratory testing are summarized below and included in this appendix and summarized in the table below.

Sample # and Depth	Soil Description	Remolded & Compacted Dry Density (pcf)	Expansion Index	% Passing the No. 200 Sieve	Thermal Resistivity @ 0% Moisture (Dry) ( $^{\circ}\text{C-cm/W}$ )	Thermal Resistivity @ 4% Critical Moisture (Wet) ( $^{\circ}\text{C-cm/W}$ )	Thermal Resistivity @ Wet Point ( $^{\circ}\text{C-cm/W}$ )	Moisture Content @ Wet Point (%)
B2 @ 3-5'	Fay CLAY (CH)	108	106	Not Tested	136	84	71	10.7
B3 @ 3-5'	Silty SAND (SM)	111	14	40.4	145	70	65	5.7
B4 @ 3-5'	Clayey SAND (SC)	110	54	Not Tested	131	77	66	7.2
B6 @ 1-3'	Fat CLAY (CH)	104	106	Not Tested	140	104	75	13.4

## Resistance “R” values test

R-Value tests were performed on samples of the on-site soils. The tests were performed in general accordance with California Test Method 301/ ASTM D2844. The result of the tests are presented below and attached in this appendix.

Location	B-3 @ 3 – 5 ft	B-6 @ 1 – 3 ft
“R” Value	57	5
Material Type	Silty SAND (SM)	Fat CLAY (CH)

## Direct Shear

A direct shear test was performed on a representative relatively undisturbed sample in general accordance with ASTM D3080 to evaluate the shear strength characteristics of the on-site materials. The test method consists of placing the soil sample in the direct shear device, applying a series of normal stresses, and then shearing the sample at the constant rate of shearing deformation. The shearing force and horizontal displacements are measured and recorded as the soil specimen is sheared. The shearing is continued well beyond the point of maximum stress until the stress reaches a constant or residual value. The results of the tests are presented in the following table and attached in this appendix.

### RESULTS OF DIRECT SHEAR TEST (ASTM D3080)

Location	USCS Classification	Peak Friction (degrees)	Ultimate Friction (degrees)	Peak Cohesion (psf)	Ultimate Cohesion (psf)	Notes
Boring 6 @ 6 - 6.5 ft.	CH	32	29	933	341	Relatively undisturbed

## Soil Corrosivity Tests

Water soluble sulfate, chloride, resistivity and pH tests were performed by Clarkson Laboratory and Supply Inc., in general accordance with California Test Methods 643, 417 and 422 to provide an indication of the degree of corrosivity of the subgrade soils at locations tested with regard to concrete and normal grade steel. The results of the tests are presented in the following table and on the laboratory test sheets attached in this appendix.

### RESULTS OF CORROSIVITY TESTS (CTM 417, CTM 422 and CTM 643)

Sample Location	B-3 @3-5 ft	B-6 @1-3 ft
pH	9.3	8.5
Minimum Resistivity (Ohm-cm)	820	120
Water Soluble Sulfates (ppm)	420	2,310
Water Soluble Chlorides (ppm)	130	2,140
Material Type	Silty SAND (SM)	Fat CLAY (CH)
Percent Finer Than No. 200 Sieve	40.4%	Not Tested

0.00 inches

(After Ground Shaking)

NOTES AND REFERENCES

+ This method of analysis is based on observed seismic performance of level ground sites using correlation with normalized and fines-corrected SPT blow count,  $(N_1)_{60cs} = f[(N_1)_{60} \cdot FC]$  where  $(N_1)_{60} = N_{field} \cdot C_N \cdot C_E \cdot C_R \cdot C_S$

++ Liquefaction susceptibility screening is performed to identify soil layers assessed to be non-liquefiable based on laboratory test results using the criteria proposed by Cetin and Seed (2003), Bray and Sancio (2006), or Idriss and Boulanger (2008)

\*  $FS_{liq}$  = Factor of Safety against liquefaction =  $(CRR/CSR)$ , where  $CRR = CRR_{7.5} \cdot MSF \cdot K_\sigma$ ,  $MSF$  = Magnitude Scaling Factor,  $K_\sigma = f[(N_1)_{60}, \sigma'_{vo}]$ ,  $K_\sigma = 1.0$ , (level ground),  $CSR$  = Cyclic Stress Ratio =  $0.65 \cdot A_{max} \cdot (\sigma'_{vo}/\sigma'_{vo}) \cdot r_d$ , and  $CRR_{7.5}$  = Cyclic Resistance Ratio is a function of  $(N_1)_{60cs}$  and corrected for an earthquake magnitude  $M_w$  of 7.5

\*\* Residual strength values of liquefied soils are based on correlation with post-earthquake, normalized and fines-corrected SPT blow count derived by Idriss and Boulanger (2008)

\*\*\* Based on Iwasaki et al (1978) and Toprak and Holzer (2003)

## APPENDIX E

### Typical Earthwork Guidelines

## TYPICAL EARTHWORK GUIDELINES

### 1. GENERAL

These guidelines and the standard details attached hereto are presented as general procedures for earthwork construction for sites having slopes less than 10 feet high. They are to be utilized in conjunction with the project grading plans. These guidelines are considered a part of the geotechnical report, but are superseded by recommendations in the geotechnical report in the case of conflict. Evaluations performed by the consultant during the course of grading may result in new recommendations which could supersede these specifications and/or the recommendations of the geotechnical report. It is the responsibility of the contractor to read and understand these guidelines as well as the geotechnical report and project grading plans.

- 1.1. The contractor shall not vary from these guidelines without prior recommendations by the geotechnical consultant and the approval of the client or the client's authorized representative. Recommendations by the geotechnical consultant and/or client shall not be considered to preclude requirements for approval by the jurisdictional agency prior to the execution of any changes.
- 1.2. The contractor shall perform the grading operations in accordance with these specifications, and shall be responsible for the quality of the finished product notwithstanding the fact that grading work will be observed and tested by the geotechnical consultant.
- 1.3. It is the responsibility of the grading contractor to notify the geotechnical consultant and the jurisdictional agencies, as needed, prior to the start of work at the site and at any time that grading resumes after interruption. Each step of the grading operations shall be observed and documented by the geotechnical consultant and, where needed, reviewed by the appropriate jurisdictional agency prior to proceeding with subsequent work.
- 1.4. If, during the grading operations, geotechnical conditions are encountered which were not anticipated or described in the geotechnical report, the geotechnical consultant shall be notified immediately and additional recommendations, if applicable, may be provided.
- 1.5. An as-graded report shall be prepared by the geotechnical consultant and signed by a registered engineer and registered engineering geologist. The report documents the geotechnical consultants' observations, and field and laboratory test results, and provides conclusions regarding whether or not earthwork construction was performed in accordance with the geotechnical recommendations and the grading plans. Recommendations for foundation design, pavement design, subgrade treatment, etc., may also be included in the as-graded report.
- 1.6. For the purpose of evaluating quantities of materials excavated during grading and/or locating the limits of excavations, a licensed land surveyor or civil engineer shall be retained.

## 2. SITE PREPARATION

Site preparation shall be performed in accordance with the recommendations presented in the following sections.

- 2.1. The client, prior to any site preparation or grading, shall arrange and attend a pre-grading meeting between the grading contractor, the design engineer, the geotechnical consultant, and representatives of appropriate governing authorities, as well as any other involved parties. The parties shall be given two working days notice.
- 2.2. Clearing and grubbing shall consist of the substantial removal of vegetation, brush, grass, wood, stumps, trees, tree roots greater than 1/2-inch in diameter, and other deleterious materials from the areas to be graded. Clearing and grubbing shall extend to the outside of the proposed excavation and fill areas.
- 2.3. Demolition in the areas to be graded shall include removal of building structures, foundations, reservoirs, utilities (including underground pipelines, septic tanks, leach fields, seepage pits, cisterns, etc.), and other manmade surface and subsurface improvements, and the backfilling of mining shafts, tunnels and surface depressions. Demolition of utilities shall include capping or rerouting of pipelines at the project perimeter, and abandonment of wells in accordance with the requirements of the governing authorities and the recommendations of the geotechnical consultant at the time of demolition.
- 2.4. The debris generated during clearing, grubbing and/or demolition operations shall be removed from areas to be graded and disposed of off site at a legal dump site. Clearing, grubbing, and demolition operations shall be performed under the observation of the geotechnical consultant.
- 2.5. The ground surface beneath proposed fill areas shall be stripped of loose or unsuitable soil. These soils may be used as compacted fill provided they are generally free of organic or other deleterious materials and evaluated for use by the geotechnical consultant. The resulting surface shall be evaluated by the geotechnical consultant prior to proceeding. The cleared, natural ground surface shall be scarified to a depth of approximately 8 inches, moisture conditioned, and compacted in accordance with the specifications presented in Section 5 of these guidelines.

## 3. REMOVALS AND EXCAVATIONS

Removals and excavations shall be performed as recommended in the following sections.

- 3.1. Removals
  - 3.1.1. Materials which are considered unsuitable shall be excavated under the observation of the geotechnical consultant in accordance with the recommendations contained herein. Unsuitable materials include, but may not be limited to, dry, loose, soft, wet, organic, compressible natural soils, fractured, weathered, soft bedrock, and undocumented or otherwise deleterious fill materials.

- 3.1.2. Materials deemed by the geotechnical consultant to be unsatisfactory due to moisture conditions shall be excavated in accordance with the recommendations of the geotechnical consultant, watered or dried as needed, and mixed to generally uniform moisture content in accordance with the specifications presented in Section 5 of this document.

## 3.2. Excavations

- 3.2.1. Temporary excavations no deeper than 4 feet in firm fill or natural materials may be made with vertical side slopes. To satisfy California Occupational Safety and Health Administration (CAL OSHA) requirements, any excavation deeper than 4 feet shall be shored or laid back at a 1:1 inclination or flatter, depending on material type, if construction workers are to enter the excavation.

## 4. COMPACTED FILL

Fill shall be constructed as specified below or by other methods recommended by the geotechnical consultant. Unless otherwise specified, fill soils shall be compacted to 90 percent relative compaction, as evaluated in accordance with ASTM Test Method D 1557.

- 4.1. Prior to placement of compacted fill, the contractor shall request an evaluation of the exposed ground surface by the geotechnical consultant. Unless otherwise recommended, the exposed ground surface shall then be scarified to a depth of approximately 8 inches and watered or dried, as needed, to achieve a generally uniform moisture content at or near the optimum moisture content. The scarified materials shall then be compacted to 90 percent relative compaction. The evaluation of compaction by the geotechnical consultant shall not be considered to preclude any requirements for observation or approval by governing agencies. It is the contractor's responsibility to notify the geotechnical consultant and the appropriate governing agency when project areas are ready for observation, and to provide reasonable time for that review.
